Yew Tree farmhouse, Wimboldsley, 538
Yo-Mei-Mon gate, Nikko, 237
York, Petersgate, 358

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

EXTERNAL FEATURES.

THE accessory accompaniments of buildings have always been a sign of a cultivated age and the progress of the arts of peace. The early strongholds, as observed in the castellated and domestic architecture of England and Scotland, had nothing outside the walls; the attempts at decoration were few, and only those which belonged to the requirements of defence, as may be seen in the 14th-century castles and houses of Scotland. The simple keep was plain and severe in outline and structure. Everything in the form of ornament was absent except the corbelling of the parapet, and the circular angle bartizan corbelled out at the corners, as we find it in many castles of the North. Dalgell Castle, Lanarkshire, and Dunglass Castle are examples of this very simple but effective architecture. With the increase of domestic safety and comfort various additions were made to buildings of this class. The enlargement of the window was one of the earliest indications of the palace fortress. The feudalism and spirit of chivalry of the Middle Ages promoted a more pretentious style, so that by imperceptible degrees we arrive at the splendour of the Tudor Age, in which a brilliant Court led to the rich accessorial architecture of the Elizabethan period. The Elizabethan architecture was pre-eminently one of accessories. Such, indeed, were the great houses, Kenilworth and Burleigh, of Holland and Hatfield, of Wollaton Hall, and of numerous others. These buildings were rich in external features, terraces and balustrades, arcades and colonnades.

Our main purpose is not to descant on the historical development of external features, however inviting the subject may be, but to speak of a few of the details which add to the completeness and appearance of buildings, from a more practical point of view, and first let us say a word on eaves. The eaves or the cornice is one of the most expressive finishes of buildings. We know how bald and mean a building is with the walls carried up and finished with only a coping, or with a mere line of guttering below the eaves drip. The eaves is the natural mode of covering the wall; it is the prototype of the cornice, which evidently was suggested by it. In one form or the other every age has adopted the feature; but the modern architect looks at it merely as a conventional detail, without often thinking of its meaning and purpose. Thus the aspect should have a definite relation to the projection of eaves; a very sunny aspect ought to have more shelter than a sunless one. In this climate the south and west sides of a building require protection both from the sun and the rain, and on those sides the projecting eaves or cornice is of primary value. Shelter and shade are the main objects of the eaves, and therefore its projection and prominence ought to be governed by the consideration of aspect or exposure to the sun and prevailing winds. Height of building will govern also the projection, the higher structures requiring the deeper projection. Attention to these points of design is not usually seen. Besides projection there is depth. There is a proper angle to be observed from the drip of outer member to the lower member of the bed-mould: if the lower members are deep, the front will be discoloured by the trickling streams which descend the cornice and front. A well-proportioned cornice is one which secures a good drip on the outer lip of upper moulding, or on the lower edge of the corona, and the members below the planceer, or soffit, should be so arranged, one within the other, as not to catch the droppings, but to relieve the deeper shadow cast by the corona. Too great a projection is a disadvantage, as it overshadows the windows and assists the wind pressure. The Italian examples of cornices do not afford any reliable rule for the projection of cornices in this country in relation to height of building, though a list of proportionate heights are given of some noted cornices in Gwilt's "Encyclopædia." These figures give about one-fifteenth of the height of building as the mean height of cornice, and at an angle of profile of 45° this proportion would be also that of the projection.

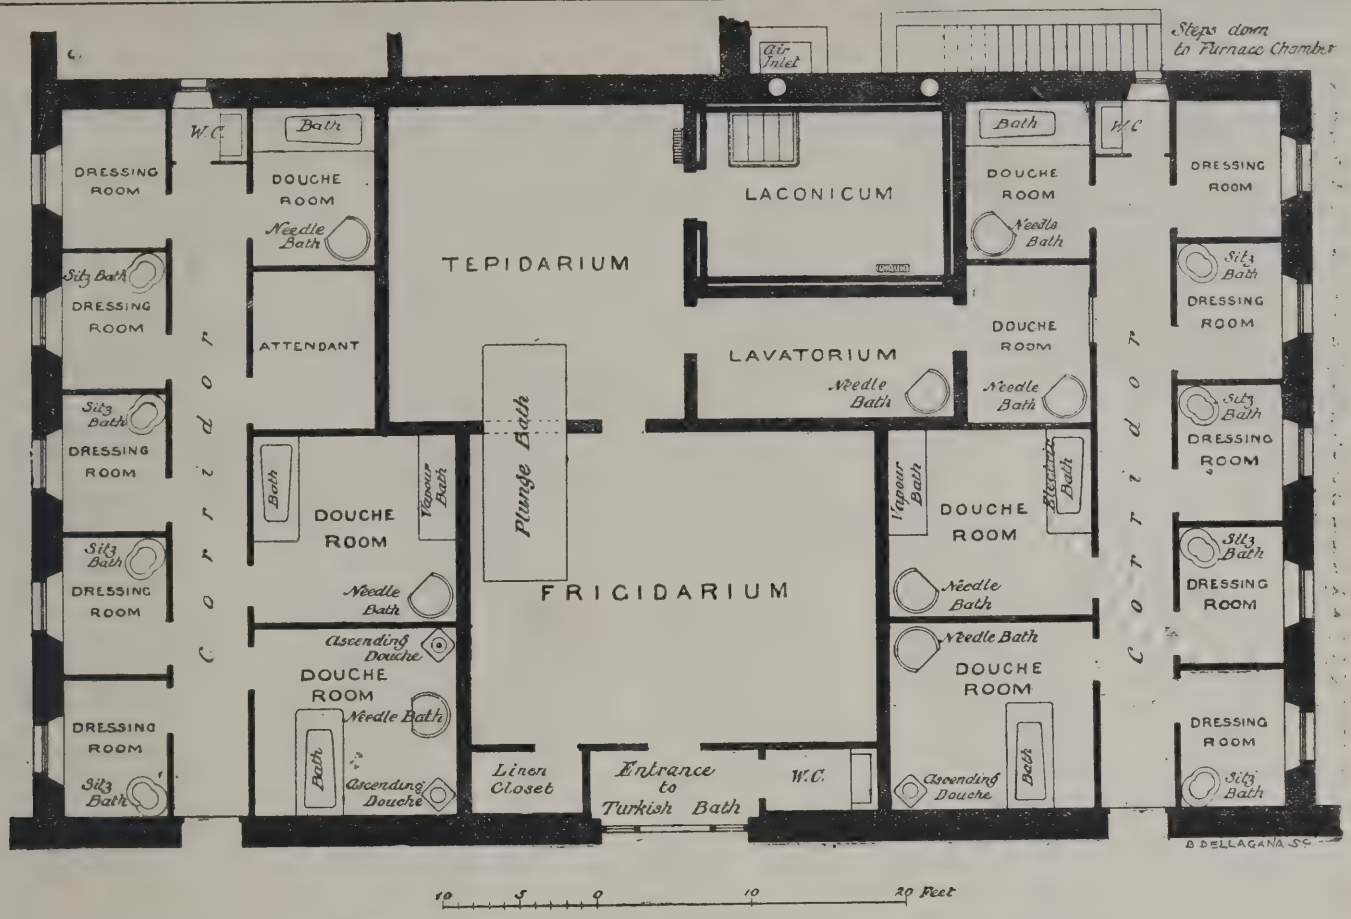
An important accessory, alike as a protection and shelter to the walls and as a covered walk, is the colonnade. It surrounded the outer courts or atria of Roman houses, and was, in this sense, both a shelter from the sun and a covered passage-way of communication. In the capacity of ornament the modern architect chiefly uses it; but its employment is seldom dictated with any reference to aspect. We see it on the sides of houses, serving only to darken the apartments and as a decorative appendage. The south, south-east, and west are the only aspects which are appropriate to its use as a shelter. As it casts a deep shadow, the windows opening under it should be large in proportion to the room they light.

As a passage-way and communication, a colonnade is a useful adjunct, though we find it seldom employed in this manner. The modern verandah is a substitute of less architectural dignity. Instead of the flat above the colonnade, which serves as a walk, there is a lean-to roof covered by zinc; the framework is generally of cast-iron, of ornamental design, but flimsy. These erections are, happily, less seen than formerly. We do not say that a verandah may not be made a very useful and comfortable addition to a front exposed to the weather, or to the sea—in these situations it serves as a screen to the windows—but let it be substantial, and be properly united to the building. Between a projecting gable, bay, and a porch, or bay-window, a verandah can be turned into account, and be, indeed, an architectural addition. Its objectionable aspects are when it is put up as an ironmonger's addition to a front for mere show; when its design consists of a number of open cast-iron pilasters of elaborate pattern, and is placed before a perfectly plain house front; where it can seldom be used as a retreat. Sometimes it is inclosed by glass sides, and then can be used as a conservatory to the room—certainly a more excusable object.

The conservatory is an adjunct that has hardly received the attention it deserves: the house is not always planned with reference to one, and the consequence is that, when the horticultural builder erects a conservatory, he does so without the slightest regard to the house. The result is evident externally. It looks a makeshift; it is stuck on the side of a gabled end as a lean-to or span-roofed building, or made to project at the side of a bay window. The architect has generally little to do with these erections. As a show house or floral apartment for the display of plants, the conservatory ought to be designed to unite with the building and be made an important feature externally. Perhaps the principal caution is that relating to junction with main building. It ought, if possible, to form a part of the plan, not be tacked on; the gutter junction should be avoided; if a span roof is adopted, let its end abut on the wall, not the side, or let it be an independent structure joined by a glazed corridor. If at the side of a house, it may be made to project and have an ornamental semi-domical termination, appearing as a wing. The lean-to form is always unsatisfactory unless its side is broken by a gable.

The porch is another feature that is frequently spoiled. It is usually placed in the centre of the building, and in such a position it ought to be made important; but the ordinary porch is usually a box-like excrescence, with scarcely any room for a seat or two to be placed in it, and hardly deep enough to allow the doors to swing. If a porch is required in the centre, it is better carried up as a projection, and be made large enough to exhibit choice plants, and to contain seats. It ought to form a feature of the architecture, and avoid the "tacked-on" appearance of an afterthought. In the older houses, like that of Moreton Hall, it is a large and commodious addition to the front, three stories high. But the central position is not necessary. A porch at the side, or

projecting at one end, is generally more conducive to internal comfort and convenience. Sometimes we see it carried up as a tower, making a feature. This development of the porch has not been attempted to any extent. The feature at least is one deserving of more attention than it generally receives at the hands of architects of our domestic structures.



THE ARCHITECT'S PUPIL.

THE old custom of apprenticeship, or of "serving articles," is a traditional mode of teaching a trade or a profession which is highly respected, and we have lately seen that it has still many advocates amongst those who desire a reform in architectural education. The results of the system, whatever may be its weaknesses, have compared favourably with the French atelier routine so well described by Mr. Arthur L. Vye Parminter in our pages. Incident, however, to the system are several breaches of contract between the parties to the indenture which are deserving of notice, and we occasionally hear of cases in which the pupil appears to have very little redress. As the law is at present, the master seems to have the best of the terms. He can draw up the indentures in such a manner as to bind the apprentice to the strictest discipline and obedience, and make him fulfil all the duties of a clerk under penalties. Breaches of covenant on the part of the master to instruct are not so easily established, though in law an action can be sustained against him, notwithstanding the master may set up in answer, misconduct on the part of the apprentice. The architect's pupil is expected to do more for himself than the novice in any other calling. A vocation which he knows nothing about except that it is something to do with drawing, is open to him. If he is industrious and clever he may find something profitable to do; but if he is not, and his master has little or nothing to do, or, on the other hand, is so busy that he cannot look after his pupils, the pupil is left helplessly to drift for himself, to spend his office hours in various games improvised out of the office furniture and instruments, or to become a mere office drudge without the slightest hope of ever learning the profession. We are not far wrong in saying that quite 30 per cent. of those who enter architects' offices leave them for something else, while another 20 per cent. make but little headway in the profession. And the fault is mainly in the system, partly through the folly and want of judgment of parents and guardians, and partly from the indolence or inaptitude of the youths themselves. Youths are apprenticed by their parents without any acquiescence on the part of the former. How can a boy of sixteen know whether he is fit for architecture or any other calling. There may be sometimes evidences of a capacity which appear to justify a parent placing his son with an architect, but it is quite impossible to conclude that his expectations are well founded. A probationary period is necessary to confirm the choice, and this is unfortunately very seldom afforded. After a few months or a year or two have been passed in the office, the youthful pupil finds he has made a wrong choice of a profession; but it is too late to alter his mind. He settles down a passive or an apathetic recipient of his master's instructions, or, if of an adventurous or turbulent disposition, openly revolts against the restraints imposed. With the mutual consent of his guardians and master, the indentures may be cancelled—a course which cannot be followed without a serious sacrifice of time and money. This course, whatever the consequences, would be probably a gain in the long run, for it would not seal a young man irrevocably to a profession he could not succeed in. Such, however, is the general fate which awaits many, as it is very seldom that the mutual consent of all the parties to the indenture can be obtained.

A more general grievance than that of mistaken choice comes to us from many sources, and it is one that calls for some legislation. There are many professional men without a business or facilities for teaching who take pupils. They take them for various reasons: some to obtain assistants to enable them to go in for competitions, some to look busy, others to replenish their coffers. Granted that a young architect has little or nothing to do; he may take a pupil to instruct and to occupy his time, and we do not deny that many men of qualifications for instruction open their offices with the best of motives, and are honestly desirous of fulfilling their part of the covenant towards their pupils. But we are sorry to say there are some men who hardly think it to be their duty to fulfil their part of the contract, if the pupil is indifferent; and the following may be taken as an actual example which has come under our notice:—An architect of good social position, and of university education, in London, advertises for a pupil. A well-educated youth, who has lost his father, is articled in due form, and for some time is engaged on ordinary work, such as tracing, writing out dilapidations, and other work of this description. But these duties are infrequent: the master often absents himself for days together, comes late, and often leaves his pupil and assistant to their own "sweet" devices. The business at length falls off—architectural practice does not pay, and the master betakes himself to journalism. He starts a monthly review for a certain class, quite outside the profession, and his pupil consents to assist him and devote himself to the paper by writing "pars," and doing much of the sub-editing work. The journal, which is beginning to pay, soon absorbs the whole time of the pupil. His term of articleship expires, and he enters into an arrangement to serve his master in the new capacity, and to obtain advertisements, at a nominal salary. The questions that occur in connection with this case are, Has the pupil any legal redress? His articles having expired, can he bring an action against the master for not teaching him the profession? Does the pupil's consent to assist his master in the new business before the term expired disqualify the pupil or his guardians from taking legal proceedings? These are points which are of importance to many pupils similarly situated. The law is pretty clear as to the first question: The master is bound to teach the trade or profession mentioned, and if he neglect to do so it is a clear breach of the covenant, for which an action would lie. It would be no excuse to say the pupil misconducted himself, though, if he quitted the service without leave of his master, the latter would have a good defence. The consent of the pupil to assist his master in another vocation would not disqualify his guardians from taking proceedings, supposing the pupil was under age. All the parties are required to give their consent before the indenture is cancelled. In the instance to which we have referred, the pupil took kindly to his altered circumstances: he had learned little or nothing of architecture or building, and journalism offered him an easy alternative—the work was light and the hours short.

Irrespective of the legal aspect, these are considerations of moment. It may be an advantage for the pupil to engage his time upon something that may prove lucrative: he may be better fitted for literary than for architectural work. As there are two parties to every contract, and as the two most directly concerned are the pupil and his master, the question arises whether any intervention on the part of the guardian is desirable. Of course, this question will depend on circumstances in each case.

Of the many disagreements between masters and pupils, we may mention removal of office. An architect sometimes changes his place of abode: he removes to some other town, and wishes to take his pupil with him. The latter refuses to go, as being inconvenient. It is a question in law whether a master can enforce the attendance of his pupil under such circumstances, and it is certainly one of the points to which attention should be drawn by those who prepare indentures of apprenticeship. This accident befalls many pupils. In one instance, on the master leaving the town, he arranged with another architect to take his pupils, who were then proficient as assistants. The complaints from pupils which we hear are numerous, and other well-authenticated cases we shall be glad to receive. One complains that the earlier period of the term is spent in the capacity of general messenger, in the copying of specifications and letters, in tracing and other mechanical duties; another says he is one of four pupils in an office with only one assistant; he has to copy letters, "square dimensions," run errands, put the office straight, endorse letters, &c. A third says that after his articles expired he could not get taken on at a nominal salary, as the master had another pupil in view. The crowding of pupils in offices is another common grievance, and under the present law an architect can take as many pupils as he pleases. The infrequency of visits from the master, who may be too busy, or otherwise engaged, to devote attention to his pupils is one of the crying evils of the system. There are still Pecksniffs in the profession, who take advantage of the docility of youths and the ignorance of their guardians. Many of the grievances enumerated would be checked if a compulsory preliminary examination were established. Every pupil should be required to pass an entrance examination before being articled. The "taste for drawing" test is now below the standard, and opens the door to many who are in many other respects unqualified, and mentally incapable of making architecture a successful profession. The premium system is more in fault. Pupils who can pay premiums are taken, quite regardless of any capacity or fitness for the profession. The whole weakness of the pupilage system springs from this fact. Young architects struggling to support themselves, and men who regard the taking of pupils as one of the legitimate opportunities of making money or of keeping their business going, find it too powerful a temptation to resist. One suggestion is, that the premium should be abolished, and a gradual salary from the commencement of the term substituted for it. Many pupils are taken now in this way, and on the whole the payment by instalments is to be preferred, as there is more inducement to look after the pupil than when one sum is paid at the signing of the indentures. We think it is time the profession should lay down some rules on the subject. The examination schemes that are proposed are measures in the direction required. A new form of apprenticeship is desirable, in which the subject of the fitness of the youth will be taken into consideration, and the master will be required to devote a certain portion of his time to the personal instruction of his pupils, to give them facilities for attending classes and lectures, and for the necessary examinations for the profession. Till these safeguards are taken in the interests alike of the pupil and the profession, the pupil will continue as now to be the victim of a system which encourages the indiscriminate crowding of offices with youths unfitted for the vocation of architect, and the machinations of designing masters and adventurers.

DUNBLANE HYDROPATHIC ESTABLISHMENT.—PLAN OF BATHS.

THE HYDROPATHIC ESTABLISHMENT AND ITS BATHS.—IX.

By R. OWEN ALLSOP, Architect.

(Author of "The Turkish Bath: its Design and Construction.")

VAPOUR BATHS are (1) whole, (2) partial, or (3) local. The most perfect form of the first of these varieties—the Russian bath—I have already described. The partial bath consists of the vapour box, which allows the head of the bather to be free, and is too simple and well-known to need detailed description here. Local vapour baths are for application to the limbs or parts of the body: in the first case, the patient sits with his leg or arm in a tube, supplied by means of pipes with steam; and in the latter the vapour is applied in metal containers, variously shaped to fit the different parts of the body.

Nothing further need be said as to the whole vapour bath, excepting that it may at times be provided in the shape of a small glass chamber within a large douche-room, the walls of the bath being of suitable, well-seasoned wood frames and best rolled glass, the glass being fitted in chamois leather, with screwed fillets and brass cups, as recommended for glazing in the hot rooms of the Turkish bath. A door would be formed in one of these glazed walls. The advantage of a "whole" vapour bath thus constructed is that it economises steam, and the attendant can observe the bather on all sides, without himself entering and staying in the vapour, as we often find him compelled to. This bath need not be more than 7ft. by 4ft. by 7ft. high, and if made a little wider accommodates two bathers. It should have steam fittings, as in the ordinary Russian bath, and be as well provided with means of ventilation. Such a chamber may also be used as a medicated whole vapour bath, and, if supplied with hot air by means of a duct, as a special private Turkish bath.

Of the vapour box it may be said that it should be placed in the douche-room, or in a separate chamber connected with the douche room. This chamber should be light, and provided above with a ventilator sufficiently large and effective in working, so that the air of the room may be kept free from any vapour that may escape from the box during the time it is in use, for the object of the physician in prescribing partial steam baths may be that the patient shall be able to breathe dry air.

There are some whole vapour baths at the *Kaiserbad* establishment at Aix-la-Chapelle that are of a peculiarly economical construction. The lower portion of the bath is much of the shape and size of the ordinary old wooden vapour box, but the head of the bather is cased in with a cabinet-shaped hood with glass-panelled doors. Thus, whilst comfortably at ease, and having plenty of room whilst seated, he can look out into the bath-room. These baths are employed for the vapour that naturally arises from the thermal waters, the water being conducted under a grating in the bath by means of suitable conduits.

Medicated vapour baths are either whole or partial. They are most economically provided by passing the steam for the bath through a tube containing the medicating substance. If along the main steam-pipe supplying the vapour baths, cylinders connected by two short pipes be arranged, these can be filled with the substance required to be absorbed by the steam. Each cylinder would have its separate medicating agent, and would require stop-cocks on the short connecting pipes, and a valve also on the main pipe, so that the flow of steam could be properly directed. Medicated baths, however, are of doubtful therapeutic action, and do not properly concern hydropathic principles; but they are often placed in public bathing establishments, and this mention of them may not be wholly useless.

Having already dealt fully with the Turkish bath in these columns, and having illustrated a first-class Russian bath and described minor varieties of vapour baths, I have said sufficient as to class (*b*) of the list given, p. 753 *ante*. From sudorific expedients, therefore, I now proceed to class *c* —general baths—the baths of

THE DOUCHE ROOM.

This is a most important feature in any system of baths, and much has already been said as to its general position in regard to other baths. The purposes that the general douche room fulfils may be accomplished, if desired, by several smaller rooms. In hydropathic establishments it is generally found most convenient to have several small douche-rooms—two or three in place of the one large room. In some of the German bath-houses we find it is frequently the custom to concentrate all the douches, &c.—the "general" baths—into one large chamber, called the *Grosser Doucheraum* or the *Douchensaal*. Such an arrangement is in every way best suited to public bath-houses where the baths are of a medical nature; but at hydropathic establishments more privacy is required by the patient. It is, therefore, well to provide at least two douche-rooms to each set of baths. By so doing patients may have the rooms to themselves and their attendants. Were there but one room this would be impossible, without delay and much consequent inconvenience.

This is an important point. The errors relating to it may be best avoided by planning so that it will be possible for each bather to have perfect privacy. Separate dressing-rooms and two or three douche-rooms, conveniently connected, will insure this. In the arrangement of the baths at the Dunblane Hydropathic Establishment, designed by Messrs. Kinnear and Peddie, this plurality of douche-rooms has been made a feature. A patient entering at the end of the bathers' corridor would be conducted to one of the dressing-rooms arranged on one side of the corridors. If his treatment did not include the packs or compresses that are administered in the dressing-rooms, he could proceed direct to one or another of

the douche-rooms, and only require to cross the corridor. There being three douche-rooms to each set of baths, it would be unnecessary to wait about, and, for the time being, each bather can have the room to himself and attendant.

The plan given shows the position of the various bathing appliances. In either set of baths each douche-room has a slipper-bath and complete needle-bath, with sprays and showers, &c. One room has, in addition, a partial vapour-bath and electric bath, and another appliances for the ascending douche. The ladies' set of baths are placed on the left-hand of the plan. The entrances to Turkish bath and to the two corridors for the miscellaneous baths are connected by covered ways with the residential portion of the establishment.

A douche-room may be fitted up with all kinds of elaborated contrivances; but what has been said as to the douche-room for the Turkish bath applies with equal force to the douche-room for "general" baths at the hydropathic establishment. More attention, however, should be bestowed upon the means of regulating the temperature of the water in the latter case, for, as pointed out in a previous article, hydropathic treatment is as much dependent, in its effects, on the *temperature* of the water, as on the mode and duration of its application. The thermometer-regulating valve, therefore, will here be useful, enabling, as it does, the attendant to apply douches, sprays, and other tonic baths at the proper and most desirable temperatures.

The arrangement and construction of water-fittings for a douche-room I fully described and illustrated in No. VIII. article on the "Turkish Bath," published in the Building News Nov. 23, 1888. The needle-bath, shower, spray, wave, and douche were then explained, and the explanation stands good in the present case. These fittings should be well and handsomely made, bungling makeshifts creating a very unfavourable impression on the visitor to the establishment.

(To be continued.)

SHADOWS.—III.

BEFORE proceeding to consider curved surfaces and their shadows, we will continue to observe the effect of the shadows thrown by a projecting body on planes or mouldings retreating more or less from this projecting body.

In the last example (Fig. 8) we noticed that the length and size of a shadow thrown by a body projecting from a plane, is proportional or equal to the distance of the body from the plane which receives the shadow thrown.

Let us now find the form of the shadow thrown by a column on to the more or less projecting mouldings of the doorway (Fig. 9).

We must always follow the same rules; that is, to draw the various lines at 45° in both plan and elevation, and find the intersection of the plane of their projections with the surfaces receiving the shadows.

In Fig. 9 we have the plan *a b* and the elevation A B of the column. At *a b* and A B we draw the lines at 45°. In the plan the shadow lines from *a* and *b* meet the moldings at *d d*, *g g*, *e e*, &c. We must therefore raise the projections of these various points in the plan in order to obtain the same points on the corresponding mouldings in the elevation. These projection lines are not indicated in Fig. 9, as they would tend to complicate the drawing. The shadow of *a b* in the plan meets the wall-plane at *c c*; by projecting these points and finding their intersection with the shadow lines from A B in the elevation, we get the points C C, the shadow of A and B. In the same way by projecting the points *d d*, *g g*, *e e*, &c., we find the points D D, E E, G G, &c., in the elevation. The light striking at O casts a shadow as far as P, and forms the shadow P H H, interrupted by the shadow H H thrown by the column. The shadow of the doorway thrown against the wall from S S to T V, as well as the remaining shadows in Fig. 9, are easily found by following the ordinary rules used for the preceding examples.

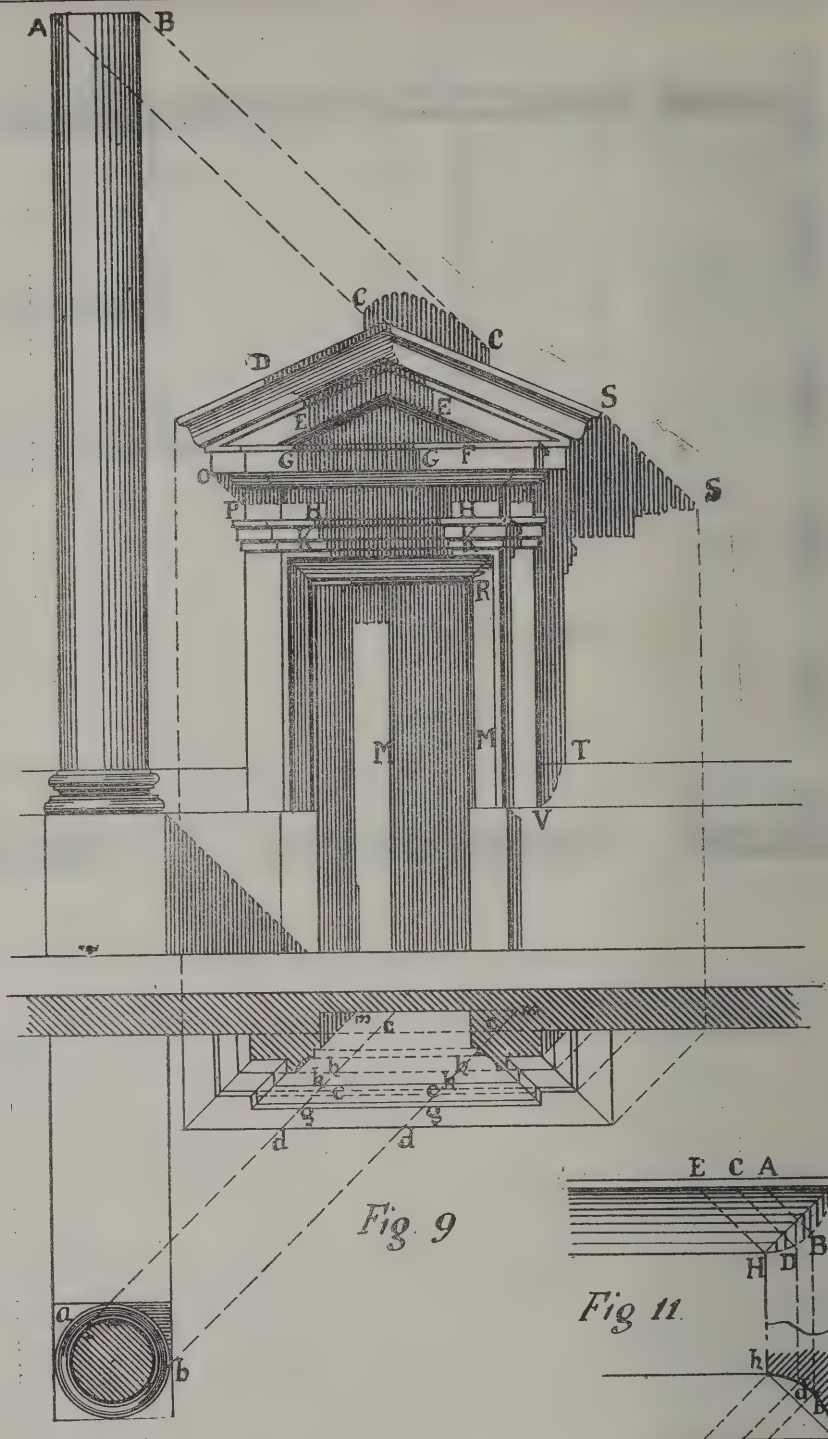


Fig. 9

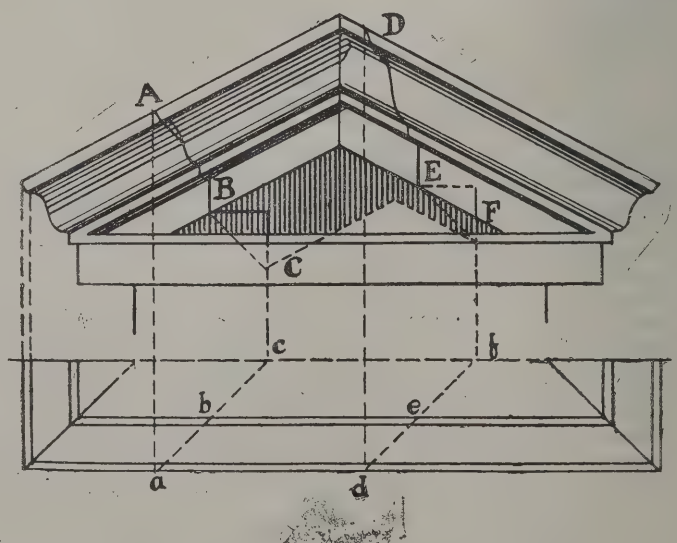
Fig. 11



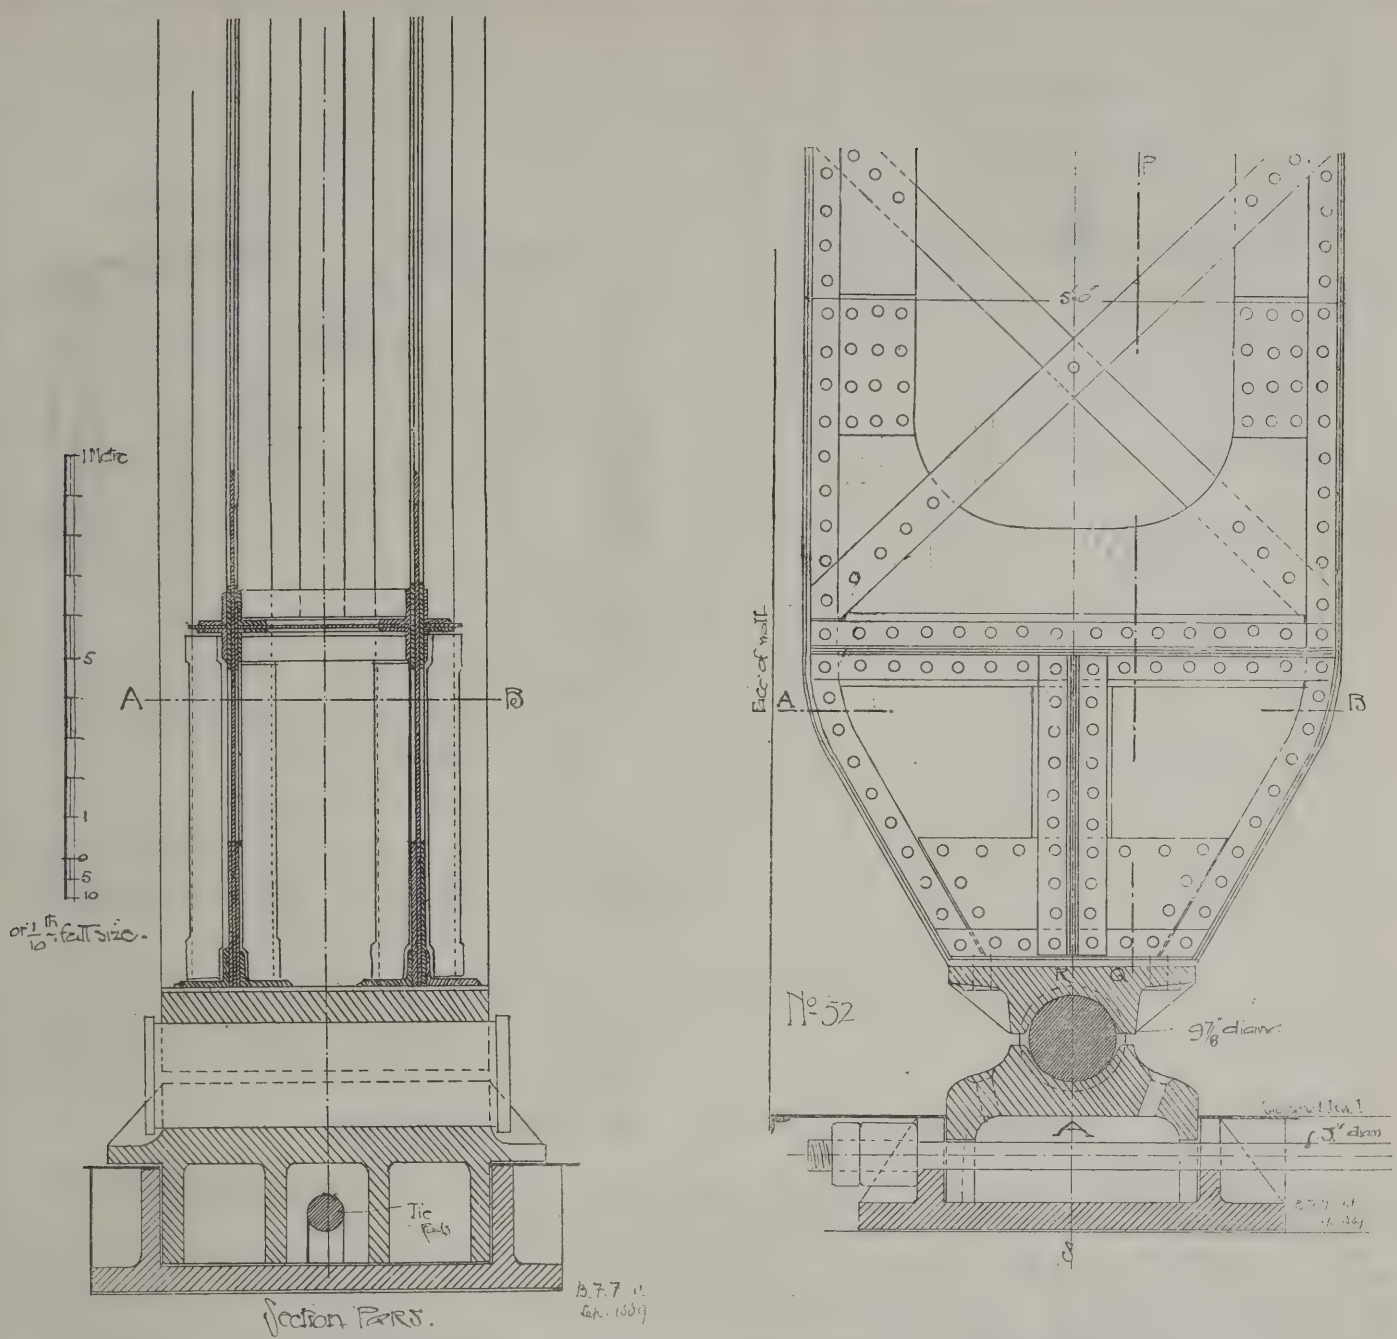


Fig. 10

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.

The mouldings of the pediment being inclined to the horizontal plane, their shadows will change in proportion as the angle becomes greater or less. To draw the shadows of the detail (Fig. 10), we must first find the section of the moulding on both sides of the pediment. We will take a point, *a*, in the plan, and the corresponding point A in the elevation, and draw *a c* at 45° in the plan. By raising the points *a b c*, we get the section of the mouldings A B C at 45°. The plane of the shadow at 45° is the plane A *a c* C. This plane cuts the mouldings on plan at the points *a b c*, and in the elevation at A and B; therefore, by drawing the shadow lines at 45°, we find the shadows of A and B. In the same manner the plane D *d f* F gives us the shadows at D E F. The shadows at A B C are evidently larger than those at D E F.

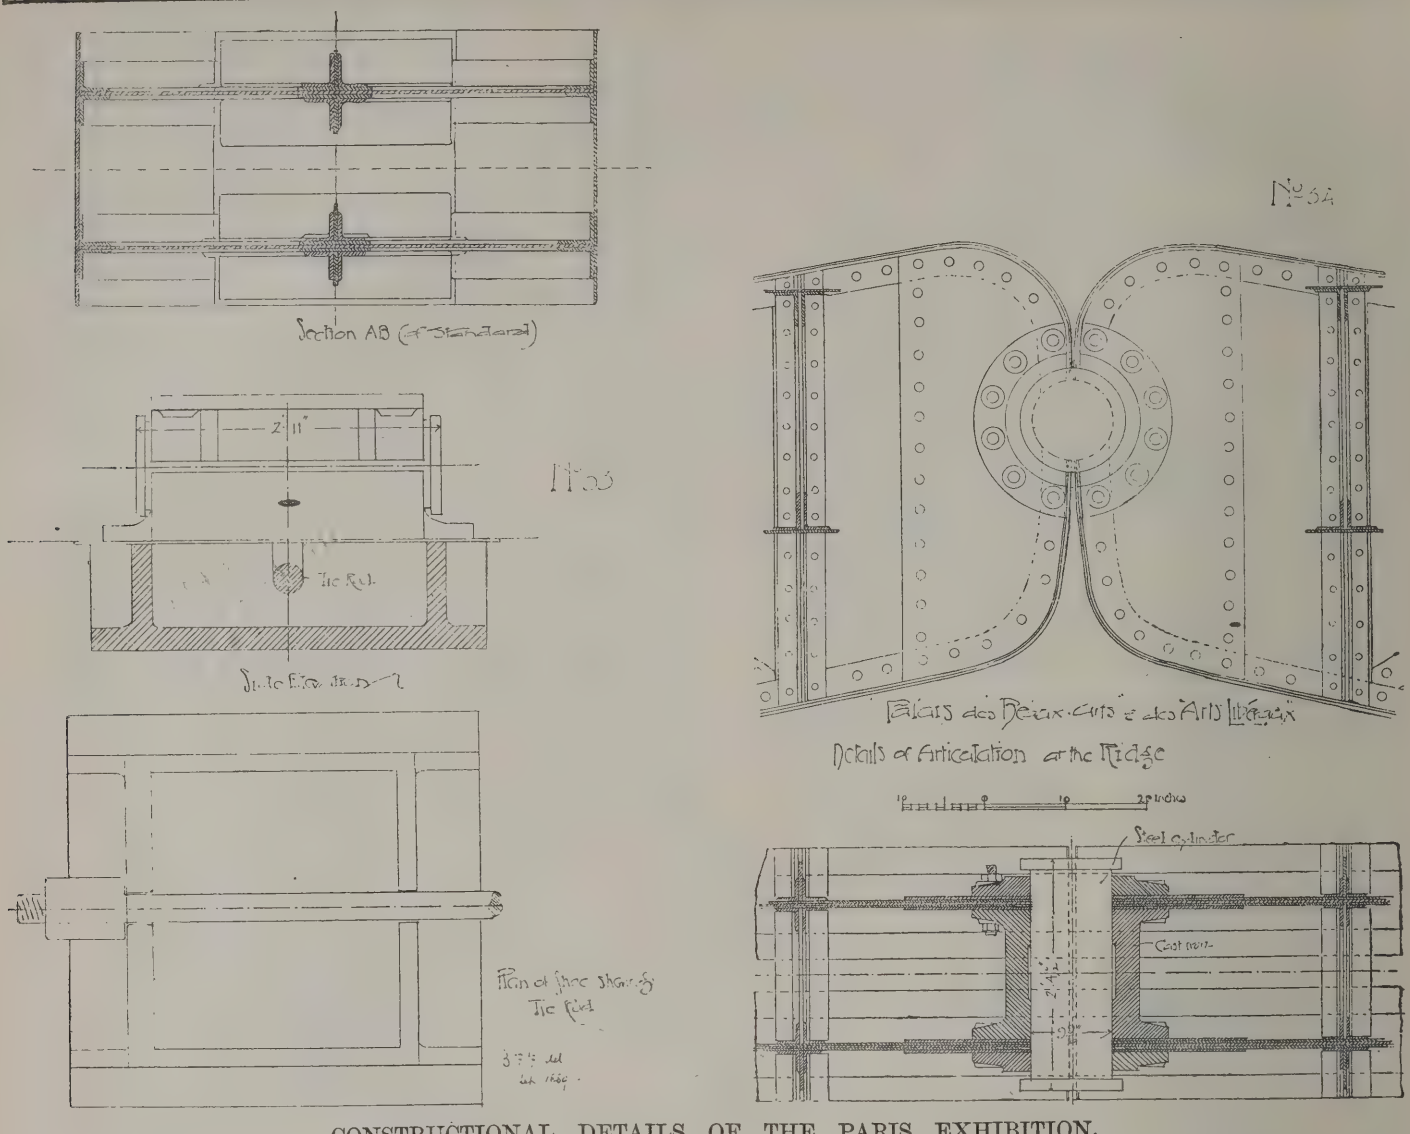
In Fig. 11 we have a detail of the moulding at the angle R (Fig. 9). In both plan and elevation we draw lines at 45°, at any given points *e c a* and E C A, meeting the plan of the moulding at *h d b*, and find the intersection of the projections of *h d b* with the lines from E C A at H D B. The moulding is a quarter-circle drawn with the centre *a*; if with the same radius and the corresponding point A in the elevation we describe the quarter-circle, we find that the circumference passes by the points H, D, and B, as it does in the plan at *h d b*. Thus we see that the shadow of mouldings at an angle as at R, is the same in form as the plan or section of the moulding, of whatever form it may be. The student would do well to draw out the angle shadows of different kinds of mouldings; a little practice will enable him to put in at once the casual shadows as at Figs. 10 and 11, without having recourse to the constructional lines.

ARTHUR VYE-PARMINTER.

Palais des Beaux Arts, Lille.

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—VII.

By BANISTER FLETCHER, JUN., A.R.I.B.A



IN the "Palais des Beaux-Arts," the glazing extends to the sixth purlin, and the light is regulated by a "velarium" above the ground-floor picture galleries. In the "Palais des Arts Libéraux," the glazing is stopped at the fourth purlin. The principals consist of a double truss (No. 50) each having its flanges, webs, and angle irons, the distance between the webs being 1ft. 6in.; they are connected by upright struts formed of sheet-iron, hollowed out in the centre, and held by two angle-irons riveted to the back of the purlins and the uprights framing their support. I give in Nos. 51, 52, 53, and 54 drawings to a large scale of the upper and lower articulations, and of the composition of the trusses themselves.

The foundation plate, which is hollowed on its upper surface, is bolted down to the stone piers, into this slides the top portion of the bed plate, which in its turn receives the circular steel pin, upon which the foot of the principal rests. The box A was filled with sand, by withdrawing or adding to which the absolute levels of the principals were preserved.

The three sheets of drawings given herewith, one-tenth full-size, explain this very fully. They are taken from drawings given by M. Contamin, the engineer, and M. Formigé, the architect of "Palais des Beaux Arts," &c. Fig. 54 is a drawing, also one-tenth full size, of the elevation and section of the articulation at the top, from which it will be seen that the two tops of the trusses are not connected in any way, but simply rest against this cylinder, which is 2ft. 4½in. long and 9 9/10in. in diameter, the ends of each half-truss being considerably strengthened by plate-iron, and at the articulation by cast-iron plates and bolts. It may be mentioned here that the tie-rod to the base is in three lengths, and goes underneath the ground itself.

THE APPOINTMENT OF METROPOLITAN DISTRICT SURVEYORS.

THE Building Act Committee of the London County Council has had under consideration for some time the desirability of effecting some reform in the system hitherto followed for the election of district surveyors in the Metropolis. On Tuesday last the committee submitted to the

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.

Council a long report, in which were embodied the following recommendations, new and important features being 2 *c*, 2 *g*, and 4 :—

"(1) That no person shall be accepted as a candidate for the appointment of district surveyor unless he shall have attained 28 years of age, and be under 50 years of age, and that every such candidate shall deliver with his application satisfactory evidence of his age.

"(2) That every candidate shall be required to sign a declaration and deliver it with his application that he becomes a candidate and will accept the appointment if he should be appointed on the following understanding :—(*a*) That he will personally discharge the duties of his office subject to section 35 of the Metropolitan Building Act, 1885. (*b*) That he will give his whole time to the duties of his office. (*c*) That he will not, during his continuance of office (except in the discharge of the duties thereof), carry on business as an architect, surveyor, or builder, or directly or indirectly, as a partner or otherwise, be interested in such business. (*d*) That he will furnish the Council with information of those cases in his district in which the orders of the Council or the requirements of the Metropolitan Local Management Acts with regard to the width of streets or to any building, structure, or erection, or projection therein beyond the general line of buildings, are not complied with. (*e*) That he will make no claim for compensation in case a diminution of his income shall at any time hereafter arise. (*f*) That he will keep his district office open from Monday to Friday (both inclusive) between the hours of 9.30 a.m. and 5 p.m., and on Saturday from 9.30 a.m. until 2 p.m., and give his personal attendance there daily from 9.30 a.m. to 11 a.m., and (except Saturday) from 4 to 5 p.m. (*g*) That he will retire, if required to do so, on attaining the age of 65, or at any date subsequent to his attaining that age.

"3. That the aforesaid declaration of the appointed candidate shall, on his appointment, be entered on the Council's minutes.

"4. That the districts be rearranged by the Building Act Committee as opportunities may occur, so that the average of the fees received may in no case amount to less than £500 per annum.

"The Council reserved to itself the exercise of its power of dismissal, if the district surveyor so appointed should not act consistently with the understanding above set forth in any of the matters referred to therein, or for other sufficient reason."

Mr. Hutton, the chairman of the committee, moved the adoption of the report.

Colonel R. W. Edis, F.S.A., moved the following amendment :—"That, during the continuance in office, he be prohibited from carrying on the business of an architect, surveyor, or builder, or be concerned, directly or indirectly, as a partner or otherwise, in a business within his own district." Mr. John Marsland seconded the amendment, which, after some discussion, was negatived, and the recommendations of the committee were approved.

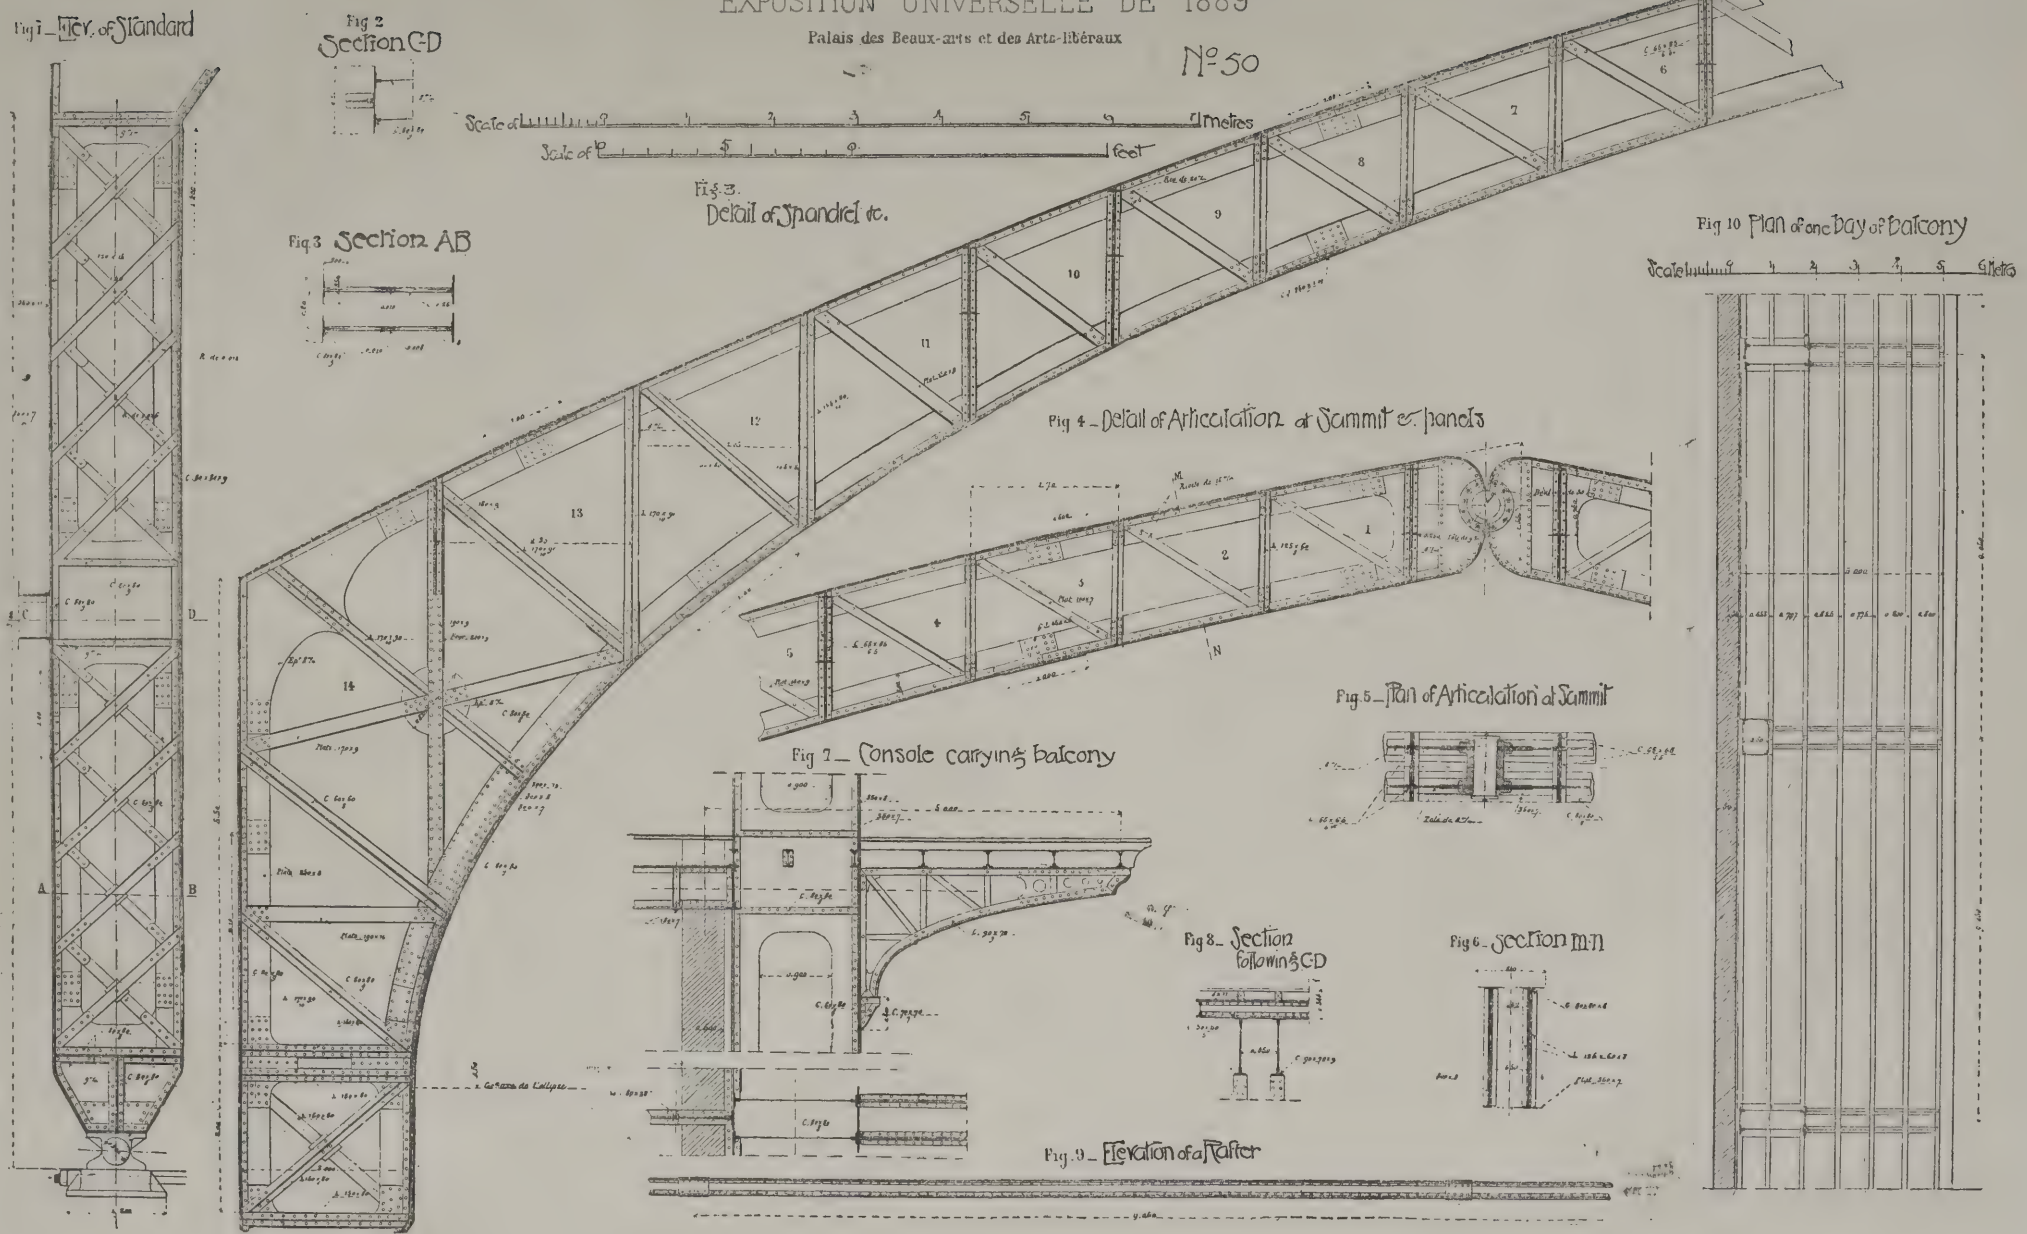
After a long debate in the French Senate on Tuesday, the Bill for the deviation of the Vigne and the Verneuil for the water supply of Paris was passed.

The late Sir Edward Baines has left to the Yorkshire College at Leeds a number of engravings and portraits, and to the School of Art in connection with the Leeds Mechanics' Institute a number of works of art including "The Italian Market-place," by Peter van Bredael; two views of Rome; the "Garden Temple," by Frederick Moucheron, and "Iphigenia," by Houbraken; engravings of works by Leonardo da Vinci, Raphael, Correggio, Guido, Paul Potter, Landseer, Holman Hunt, &c.; and portraits of Lord Brougham, the Earl of Carlisle, and Sir H. Havelock.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Dundee Institute of Architecture and Art.—The annual meeting of this institute was held on Thursday, the 26th ult. The report congratulated the members on continued prosperity, and stated that the roll for this year contains the names of seven honorary members, 49 members, and 152 associates—a net increase of three—while the balance in hand, after meeting all outlays, is £60 5s., against £49 1s. 9½d. last year. The interest in the excursions continued undiminished, and the lectures had been more numerously attended than on previous sessions, a livelier interest being taken in the discussions.

Excursion to Yorkshire Dales and Abbeys.—The North Staffordshire Naturalists' Field Club and Archæological Society have this year made Ben Rhydding Hydropathic, Ilkley, the head-quarters of their long summer outing. Bolton Abbey, the Strid, and Barden Tower were visited on Thursday in last week, under the leadership of Mr. T. S. Wilkins. On Friday the Clapham and Ingleton district, including the Caves, was explored; and on Saturday a visit took place to Malham Cove and Gordale Scar. Sunday was devoted to Ilkley and the neighbourhood of Ben Rhydding; and on Monday, after visiting Fountains and Kirkstall Abbeys, with Ripon Cathedral, the party returned home.



The new tower and spire of St. Mary's parish church, Stoke Newington, were dedicated on Saturday afternoon by the Bishop of London.

Memorial stones were laid last week at Carperby, near Aysgarth, of a new Wesleyan chapel. It will be Gothic in style, built of pitch-faced ashlar, with freestone dressings, and the internal woodwork is of pitch-pine. Mr. T. F. King, of Edgeley, is the architect, and the contractors are Messrs. Dougill, of Aysgarth, and Mr. Coates, of Merrick.

DESIGNS FOR THE SHEFFIELD MUNICIPAL BUILDINGS.—CONTEMPORARY BRITISH ARCHITECTS.—THE GRISSELL MEDAL DESIGN FOR A TIMBER SPIRE.—RESIDENCE AT SUTTON COLDFIELD.—DESIGN FOR A CHASED DRINKING-POT.

Our Illustrations.

SHEFFIELD MUNICIPAL BUILDINGS: THE FINAL COMPETITION DESIGNS.

LAST week we gave illustrations of the chosen design by Mr. Mountford; to-day we illustrate two of the other five. Mr. F. H. Tulloch, in his report to the Council, which we quote in brief, says:—"The principal entrance in the centre facing Pinstone-street leads to a spacious entrance-hall, from which is approached the main corridors and the grand staircase. The council-chamber is placed on the principal floor in the centre of the site, and is quite isolated from all noise arising in the surrounding streets. It is approached by the grand staircase, and also by the north corridor; it has a commodious anteroom, and the cloak-rooms are conveniently adjacent thereto. A gallery for the public is approached by a staircase leading from Surrey-street. The reporters have space allotted them on the floor of the council-chamber. A small retiring-room for the use of the mayor is provided. The reception-rooms are placed facing Pinstone street, and being of large dimensions, entailing a corresponding magnitude in height, give an opportunity of dealing in a broad manner with the architecture of the main façade. These rooms are approached by the grand staircase. The cloakrooms are placed in a mezzanine floor, and are conveniently arranged for the accommodation of guests before entering the reception rooms. A serving-room is provided at the north end of dining-hall, which is in direct communication with the kitchens, &c., on the second floor. One large committee-room and two sub-committee rooms are facing Surrey-street, and the remaining two large committee rooms and sub-committee room are placed facing Cheney-row, all on the first floor. The whole of the reception-rooms, the mayor's parlour, council-chamber, grand staircase, and committee rooms, with the exception of those facing Cheney-row, can be cut off from the departmental offices by screen doors across the corridors. The town clerk's offices are planned to occupy the end block facing Norfolk-street and a small portion of Cheney-row on the first floor. The borough surveyor's offices are placed to the left of the principal entrance facing Pinstone-street and part of Surrey-street, on the ground floor. The borough accountant's offices are planned to occupy the building in the centre of the site on the ground floor and basement. The offices of the health department occupy the rooms on the right of the principal entrance facing Pinstone-street. The sewerage and rivers offices are placed to occupy the Norfolk-street front on the second floor. The weights and measures offices are placed in the basement. The offices of the waterworks department occupy the whole of the block facing Norfolk-street, and a portion of the Surrey-street and Cheney-row fronts on the ground floor. There is provided an isolated block of buildings, with sufficient lavatory and w.c. accommodation for the use of the several departments on each floor. The rooms for caretaker's residence are placed on the second floor, facing the Surrey-street side. The kitchens, &c., are placed in close proximity to the dining-hall on the second floor. having a waiters' staircase from scullery to serving-room and a double service lift. The public lavatories are so planned as to be quite separate from one another. There is provision made in the boiler-room in basement for Lancashire steam boilers, and laid on from the same a steam main traversing the course of the general corridor. This main carries branch pipes to the positions occupied by coils on the various floors overhead, with vertical services having connections on each floor with "radiators." In the council chamber, reception rooms, and the grand staircase, it is proposed to have steam-heating battery chambers under the floor. The removal of the vitiated air from the various rooms would be effected by means of extraction ducts carried up in the walls, and provided in each room with a self-acting valve to prevent back draught. It is proposed to construct the whole of the front elevation and the return elevations of the main building would be faced with stone from the Warwick Quarries, Huddersfield, or from the Bolton Wood Quarries, near Bradford. The large courtyard would be faced with pressed facing bricks, the smaller courtyards or areas would be faced with white glazed bricks. The roofs would be constructed of wood and iron and covered with Westmoreland green slates. The floors of the reception rooms, committee rooms, and council chamber would have solid hard wood parquetry laid on concrete with proper bed; the corridors generally would be paved with marble and other mosaics. The grand staircase should be ornamented generally with marble linings, balusters, rails, &c. The joiners' work generally would be of wainscot, the principal rooms having panelled dadoes, &c., as shown on sections. Estimate:—

Main building amounts to 2,054,153c.ft. at 8½d. per foot	£70,612 0 0
Tower amounts to 44,904c.ft. at 1s. per foot.	2,244 0 0
Foundation below 262·0 level in Norfolk-st.	5,000 0 0
	77,856 0 0

Mr. Henry T. Hare, in describing his design, says in his report: "Although the disposition of the various apartments is similar to that shown in the sketch plans, considerable alteration in detail has been made, partly necessitated by the supplementary instructions, and partly the result of further consideration. All the suggestions made in the final instructions have been carried out." The walls are proposed to be built of brick, faced with Huddersfield stone; the floors and roofs to be constructed on Lindsay's system, with trussed steel joists and pumice concrete, the roofs being covered externally with green Westmoreland slates. The council chamber walls to be panelled in dark oak to a height of 12ft. from the floor, and above faced with Ancaster stone; all fittings in dark oak; floor to be in parquetry. The entrance hall and staircase are intended to have the walls faced with Ancaster stone, polished Hopton Wood, with marbles in dadoes and panels; marble and Hopton Wood stone would also be used in the staircase for balustrades, &c.; floor to be in marble mosaic; ceilings in enriched plaster. The report enters at considerable length into a proper system of warming and ventilation to be employed, and also an adequate scheme of drainage and sanitary accommodation. Cost:—

Cubic contents—	
2,012,000c.ft. at 8½d.	£71,250
Foundations	5,000
Upper part of tower—	
60,000c.ft. at 1s. 3d.	3,700
	£79,950

The illustrations of designs in this competition will be continued next week.

CONTEMPORARY BRITISH ARCHITECTS.

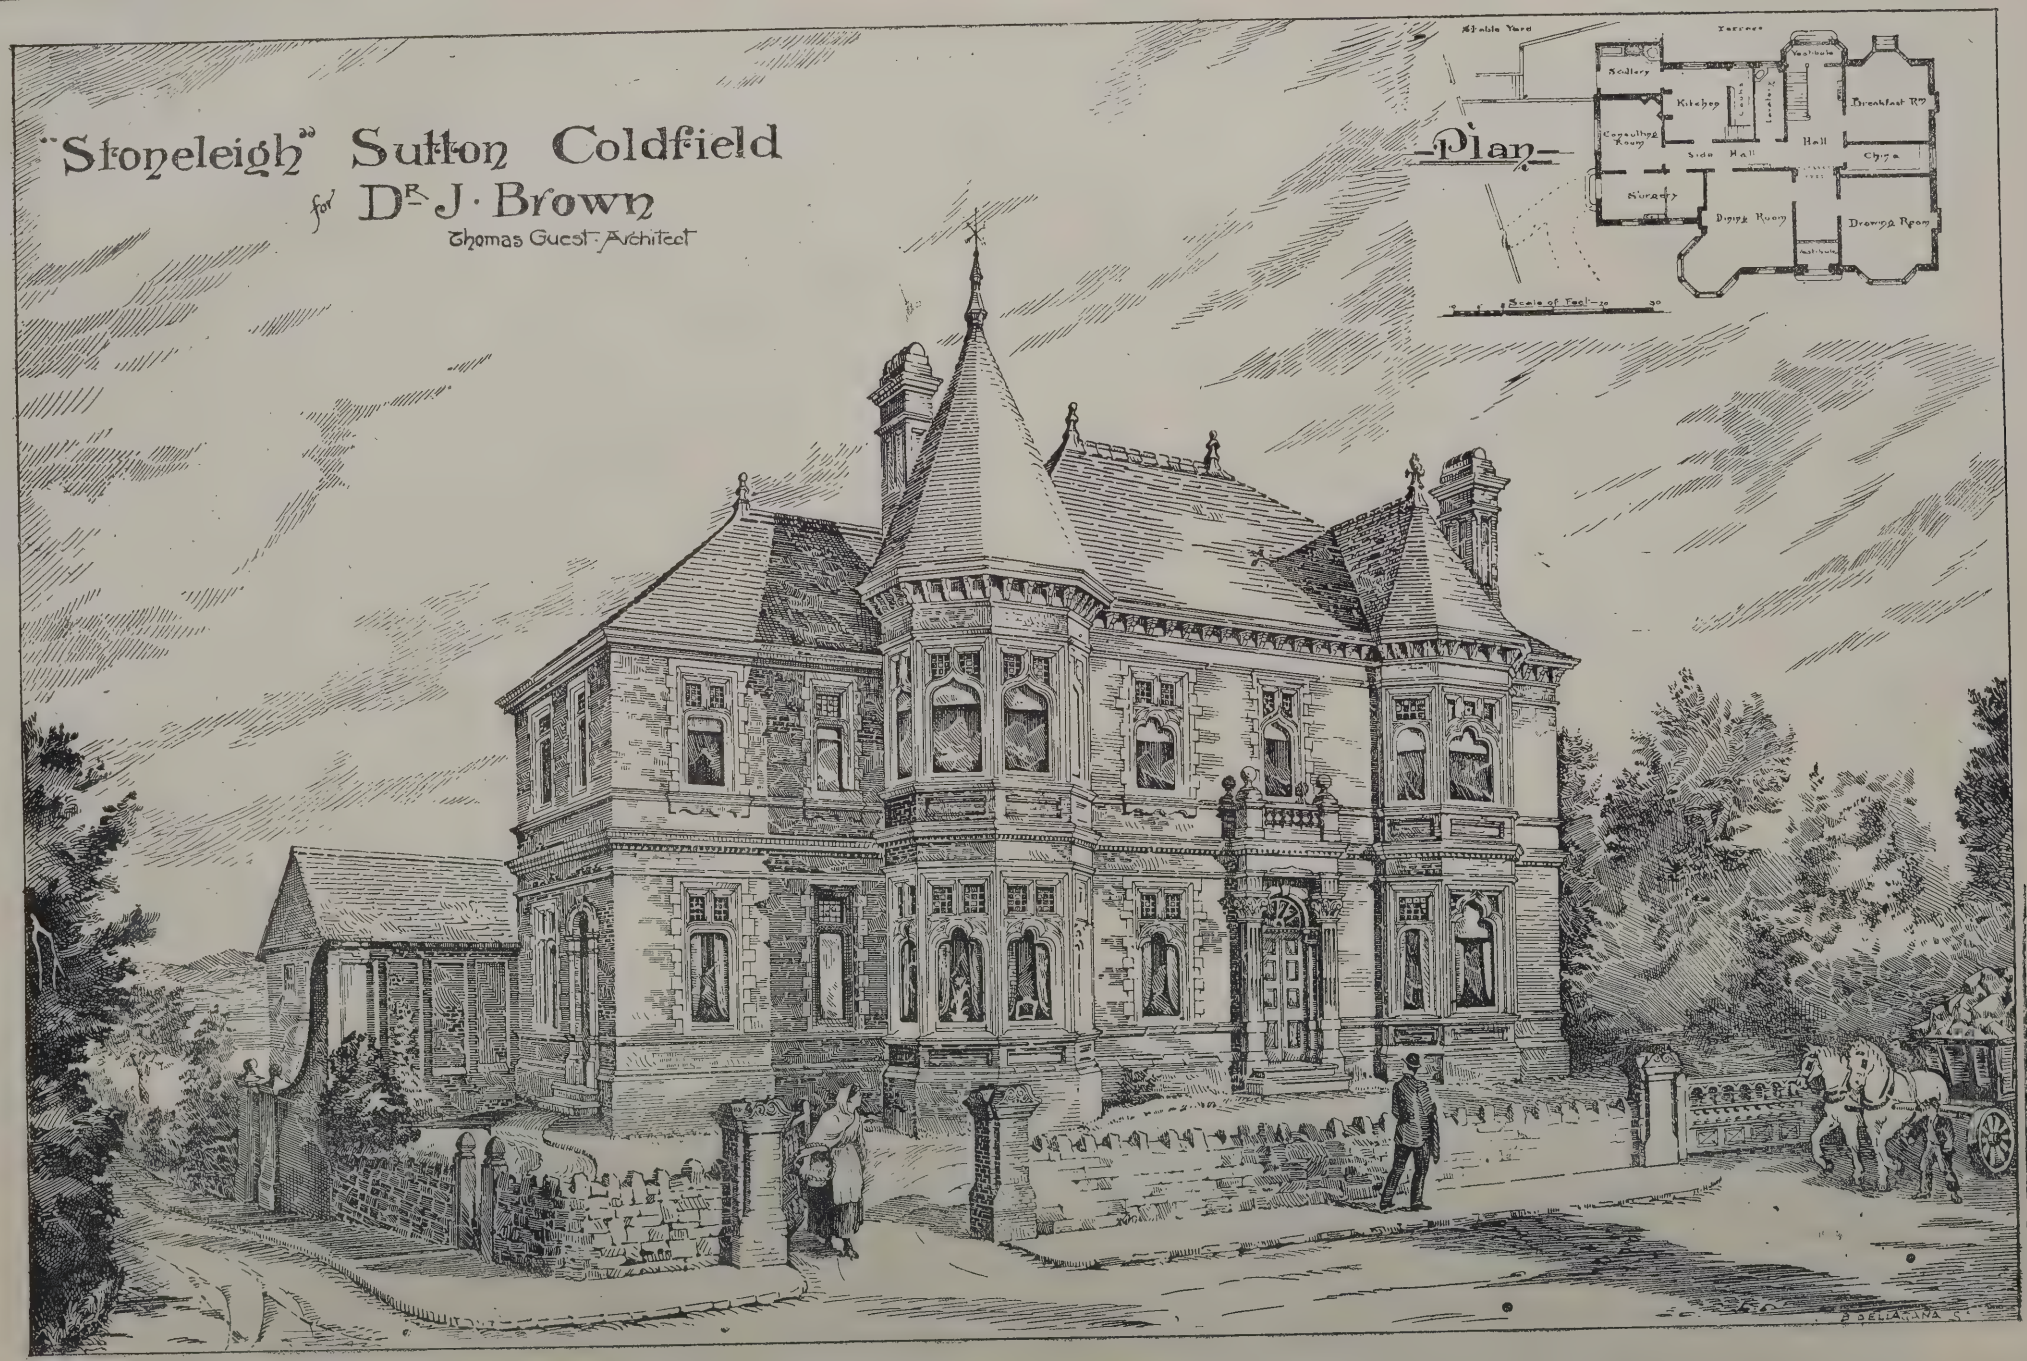
(SEE description on p. 29.)

THE GRISSELL MEDAL DESIGN FOR A TIMBER SPIRE.

THE accompanying illustration represents the Prize design for a timber spire, prepared in accordance with the conditions issued by the R.I.B.A. Council last year, by Mr. Walter Percival, of Longton, Staffs, who forwards us this description from a fully-detailed report which was sent with reference to the drawings:—The wind pressure, taken at 56lb. per square foot of perpendicular surface, on being resolved to the different exposed surfaces of spire, we have 437½sq.ft. at 54½lb., 315sq.ft. at 27¼lb., 109ft. 4in. at 36·160lb., 136sq.ft. at 18·080lb., 435sq.ft. at 56lb., 609sq.ft. at 28lb., 170sq.ft. at 1½lb., giving a total pressure of 89,191¼lb. acting in a horizontal direction, and tending to slide spire on its bearings. The materials intended to be used are Riga fir for interior work; dark oak of English growth for the exterior woodwork, finished in clear oil; panelling to be in Portland cement, with foliated work finished alto-relievo, and set natural colour, with a tinted background; 26oz. copper covering. The vertical load on each hip is something like 9,400lb., including a vertical pressure caused by wind, which at 56lb. to a perpendicular surface gives ·958lb. per foot as the vertical component in this instance. The total weight of spire is deduced from the following:—

Woodwork ...	304,624·620lb.
Ironwork	3,037·580
Cement	15,916·500
Lead	1,527·500
Copper	1,454·000
Total in lbs.	326,560·200

By the parallelogram of forces it will be found that the resultant force of the whole of spire falls at about the point of maximum deviation, this tending to show that only in furious gales and other spasmodic applications of Nature's forces have we anything like a great tensile stress on the windward side of spire, which has been amply provided for. Entasis has not been considered, for the following reasons. Whenever it is adopted, it is principally for compliance with certain optical delusions. Truthfully, I acknowledge, and agree with several writers, that when an arris is diminishing from the base upwards, it ought never to be a perfectly straight line, but should always have a slight outward curvature, so as to prevent any appearance of hollowness in outline. But since entasis may be worked by several methods, it is an almost impossible thing to get that grace of contour or that subtle grace of line and curve which so often holds in suspense the æsthetical admirer, without first considering the situation and height of the spire above ground, the appearance of having bulged by too great curvature being often brought into painful obtrusiveness when seen in perspective. Secondly, several writers have argued that the condition of the spire is greatly improved by the outline producing a form of equal strength in all its parts; but by simple rules the theoretical principle of entasis in construction is comparatively of little importance, and merely to give justice to the remainder, it would be absurd to introduce unnecessary difficulties in the practical or actual construction of the work.—W. P.

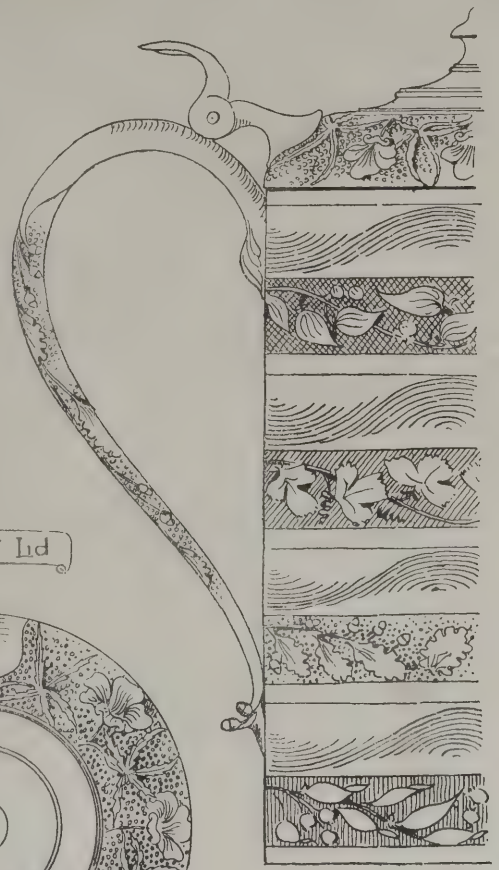


[We illustrated the extra medal design from the same competition by Mr. Pennington in the BUILDING NEWS for April 11th, 1890.]

"STONELEIGH," SUTTON COLDFIELD.

THIS residence, recently completed, situated in one of the most picturesque spots in the Midlands, is constructed of red brick with Bath-stone dressings. The roofs are covered with Handsworth Wood red pressed tiles, and the walls built hollow. The whole of the joiners' work is executed in best selected pitch-pine. The site, which falls with rather a sharp gradient from the main road, is taken advantage of at the back, and a charming terrace provided, from which the lawn is reached by a flight of stone steps. Mr. Thomas Guest, Cobden Buildings, Corporation-street, Birmingham, is the architect, and Mr. J. Simons, also of Birmingham, the builder.

CHASED DRINKING-POT.



IN the design for the above, which we illustrate herewith, there are two points to which we would call attention. The first is the excellence of the design, and the second is the youthfulness of the designer. With regard to the first, we cannot but commend the variety and elegance of the ornamentation, which is rich without being overdone, and we are, moreover, struck with, what seems to us, its originality and freedom from modern bias. With regard to the second point, we would say that if Walter Taylor is alone answerable for the design, then he reflects great credit on The Guild and School of Handicraft, of which institution he is a pupil; and we shall be surprised if we do not hear more of him. The original drawing was shown at the recent exhibition of the Armourers and Braziers' Company at their hall in Coleman-street.

WAYSIDE NOTES.

SIR ARTHUR BLOMFIELD has given some assurance that the restoration works to be carried out at the old church at Burnham Thorpe will not be of a kind likely to interfere with parts and features of the fabric that existed in the time when Nelson sojourned at the rectory. In the words the architect has penned to reassure parties who feared that the building would be dealt with in such a manner as to obliterate features hallowed by associations with the great commander, we find ample reason to believe that the restoration will be conducted in a most conservative spirit:—"It is not proposed to alter a single feature which exists, as he (Nelson) must have seen it, nor will anything be removed that can in any way be associated with his memory. The top of the tower and the south aisle will be rebuilt. All arches will be opened out, the modern deal pews and roofs will give place to oak of a suitable character, and the only old roof remaining—viz., that over the south aisle, will be carefully preserved and repaired." This restoration, it will be seen, is conceived in a proper spirit. Nelson's father, in 1793, completed various crude alterations to the building, pulling down the south aisle and rebuilding the upper story of the tower, besides blocking up the arch into the tower, and erecting a gallery over. It seems plain, then, that no one of an architectural turn of mind will object to the proposed restoration, although, as it is difficult to please everybody, there may be some worthy individuals who, on the wolf-and-lamb principle, will urge that, though these alterations were effected subsequent to the date when Nelson left the town for good, they were carried out by his father, and that work associated with Nelson *père* has interest second only to that associated with the son.

I have not done a vast deal in the patent way, but really think I shall go in largely for it at once, and get provisional protection for all sorts of arrangements for cathedrals and churches, town halls, free libraries, public and private houses, &c., so that whenever it happens that a competitor has been successful with a plan after any of my ideas, I may be in a position to demand a royalty or enforce an alteration in the plan. I only hope that I am not destroying the golden future I see before me by thus letting the profession into the secret, though I quite think there may be a rush for the Patent Office and a scramble for the stamping-room if it comes to pass that an architect is able to patent an arrangement of rooms, &c., so as to prevent its adoption for the town hall of a large civic corporation. I foresee the rush: Chancery-lane will be impassable for days, and the official quarters in Southampton Buildings will be besieged by a mass of struggling architects anxious to effect preliminary steps for obtaining letters patent for whole folios of plans. So, perhaps on second thoughts, I won't do any patenting myself; but just stick to good old types of plan that can't be patented on account of long prior use, and will manage with six-roomed cottages with back additions, and ten-roomed houses with the old original fore-and-aft staircase; and when that long-expected cathedral job comes along I will content myself with the plan and arrangement of St. Paul's on the one hand, or Salisbury on the other. I shall be able to jog along in this way.

Seriously, I should like to see Messrs. Flockton and Gibbs try their case *in re* the accepted plan for the Sheffield Municipal buildings. It would be an event of more than passing interest in an intolerably dull architectural world. A successful issue would be very doubtful. If the patentees' claim is valid, no one would desire to see justice miscarry, although at the present time all architects pooh-pooh the claim, and very naturally. It is, however, just possible that the nature and extent of the claim may not be understood by the profession generally, and it may be that the claim for infringement only covers some small portion of the plan that Mr. Mountford could easily modify. In this event, no one benefits by the patent, which would only act on the dog-in-the-manger principle. Anyhow, this is a very interesting point to the profession, and if proceedings are taken in the matter, they will be assiduously followed by every architect. Messrs. Flockton and Gibbs would be doing us all a good turn in trying their case, as it might for all time show the futility of preventing the adoption of certain plans by an architect in his everyday practice. If such proved the result, however, the claimants know what they would have to pay, and, knowing this, they will perhaps wisely hesitate to try and enforce their claim.

I have thought a good deal about the recent deputations to the Institute Council, and not to much moment; for it would appear to me that the primary cause of the evils complained of by the spokesman of the deputations are referable not so much to the sub letting system, but rather to the tendencies of the present time towards cheapening cost of production and cutting down profits to a minimum. None the less are they to be fought against and overcome where possible. If the Institute can do anything to lessen the "sweating" that takes place in the building trades, as well as in other industries, as humbly implored by the operatives who recently waited upon the members of its council, it will be doing good work indeed. How it is to be done is not at once apparent. The "Heads of Conditions" sanctioned by the Institute contain the clause against the sub-letting of contracts, and beyond recommending its insertion into agreements between builder and client, it cannot do much to prevent the sub-letting that in spite of all is the universal practice among a class of contractors. And, as a matter of fact, the subletting clause, though everywhere adopted by architects, is more honoured in the breach than in the observance. It is mechanically inserted, and as mechanically ignored by the contractor—ignored, that is to say, in the spirit, though observed in the word. To prevent every kind of sub-letting on the part of the contractor would require an architect with supernatural perception. It is, indeed, much to be feared that, under the contract system, a certain amount of sub-contracting must take place, though, at the same time, vigilance and firmness on the part of the architect may do much to prevent it.

The burden of the tale of the operatives that waited upon the Institute is no new thing. It has been written upon and spoken upon for years. The only difference is that when architects deal with the question it is as touching the outlook and prospects of English architecture, whereas when the craftsman takes up the cry it is very naturally only with reference to his own position and advancement. To us the meretricious worker is objectionable from an architectural point of view; being but human, we are prone to think first of our own interests, and so when he himself regards the way that things are tending it is with reference to his interests as a worker and wage-earner. The so-called "first law of nature" comes into play in both cases. The artisan, however, has more claim to consideration from an impartial onlooker, for in his case it is a matter almost of life and death—at any rate, it is the difference between struggling and living comfortably. And as we have ever striven to assist the building operative, believing that his interest and that of the architect are identical, we should now gladly do all in our power to aid him in his endeavours to mitigate the evils of "sweating." My own power for good, unfortunately, is little more than any other architect. I can only draw general attention to the effort made on the part of the craftsman, and point out that what he desires for his own benefit is equally for that of the architect, and hope that those who in the past have written and lectured on the relative positions of architect, builder, and operative, will not miss the present opportunity for making further suggestions.

We have all often expressed disgust at a system of building that creates one big financier who arranges with various other parties for the execution of certain portions of a contract, and we have longed for the day when the good old master-builder shall again appear upon the scene. Now this would be as bright a day for every craftsman, artisan, and operative connected with the building trade as for ourselves, and the evils that induce us to wish for the change are precisely such as led the little band of operatives to seek a hearing of the Council of the Royal Institute of British Architects. Knowing this, perhaps the architectural profession may take a lively interest in an event that seems in danger of being completely passed over.

The Architectural Association may some day congratulate itself that it was prevented from deciding in a premature way on the merits of the proposed reorganisation. It will, at any rate, have the satisfaction of knowing that it did not commit a blunder through ill-haste. I have no wish to say that the reforms, urged in the report so conscientiously prepared by the Education Committee, would, if carried out, have constituted a blunder; but there is always ample room for regret in actions done in haste, and, I might almost say, *in a panic*, for one speaker at the last meeting of the Association actually expressed a fear that the delaying of the consideration of the reforms until next session would *afford an opportunity for other bodies to step in and do the work!* If considerations of this sort were to weigh in our every action in daily life, we should rapidly get to a state of feeblemindedness that would land us, ultimately, in a madhouse. Such haste for such reasons is unbecoming and undignified; and I maintain that, except in any cases where some degrees of self-interest may be apparent, one and all will be glad when next session comes round that they have had a few quiet months to reflect upon the proposed radical alterations in the constitution of the Association. Enough has been said and written to turn the thoughts of members into such channels as may be natural to them, and when the subject is again brought forward they will be in a position to judge the merits of any schemes that may be matured for their consideration. For my own part suffice it to say that, I think well of the idea to improve the Association, and I think well of the endeavours of the Education Committee; but it has become evident to me that, despite the assertions to the contrary, there is nothing like unanimity among the members, and that a hasty decision on so vital a point as the total reorganisation of the educating machinery might easily form the begining of the end with regard to the popularity of the Architectural Association. GOTH.

CHIPS.

Camden Place and Park, Chislehurst, the late residence of the Empress Eugénie, has been purchased by Mr. W. Willett, the well-known builder, of London and Brighton, who proposes to develop it as a building estate.

The London County Council has bowed to the inevitable, and has abandoned the clumsily drafted Strand Improvement Bill, in consequence of the committee of the House of Commons having rejected the "betterment" clause.

The death is announced, at the age of 70 years, of Antoine de Solomé, the crayonist. Born at Munich, he spent the greater part of his life in England, and executed in this country over two thousand portraits.

The Amendment Bill to the Metropolis Management Amendment Act has this week safely passed through all stages in the House of Commons.

The memorial clock subscribed for by the inhabitants of Oswestry in memory of the late Mr. Askew Roberts, the well-known Welsh antiquarian and author of "The Gossiping Guide to Wales," was handed over to the Mayor of Oswestry, in trust for the burgesses, on Tuesday. The clock is a treble-dial one, supplied by Messrs. Joyce, of Whitchurch.

Dulwich Park has been opened to the public by the Earl of Rosebery. The land on which the park has been formed, extending to 72 acres, was presented to the late Metropolitan Board of Works by the Governors of Dulwich College, on condition that the Board would lay it out as a park for the use of the public. This arrangement was confirmed by Parliament, and the park has been laid out in accordance with designs by Mr. J. J. Sexby, at a cost of about £33,000. In addition to the usual paths it contains a lake, carriage road, a horse ride, and two lodges.

In the omnibus Bill of the Metropolitan Railway Company, which has just passed through both Houses, the Company are empowered to construct subways at King's Cross and Euston, and also a railway over six miles in length from the Aylesbury and Buckingham Railway to Quainton.

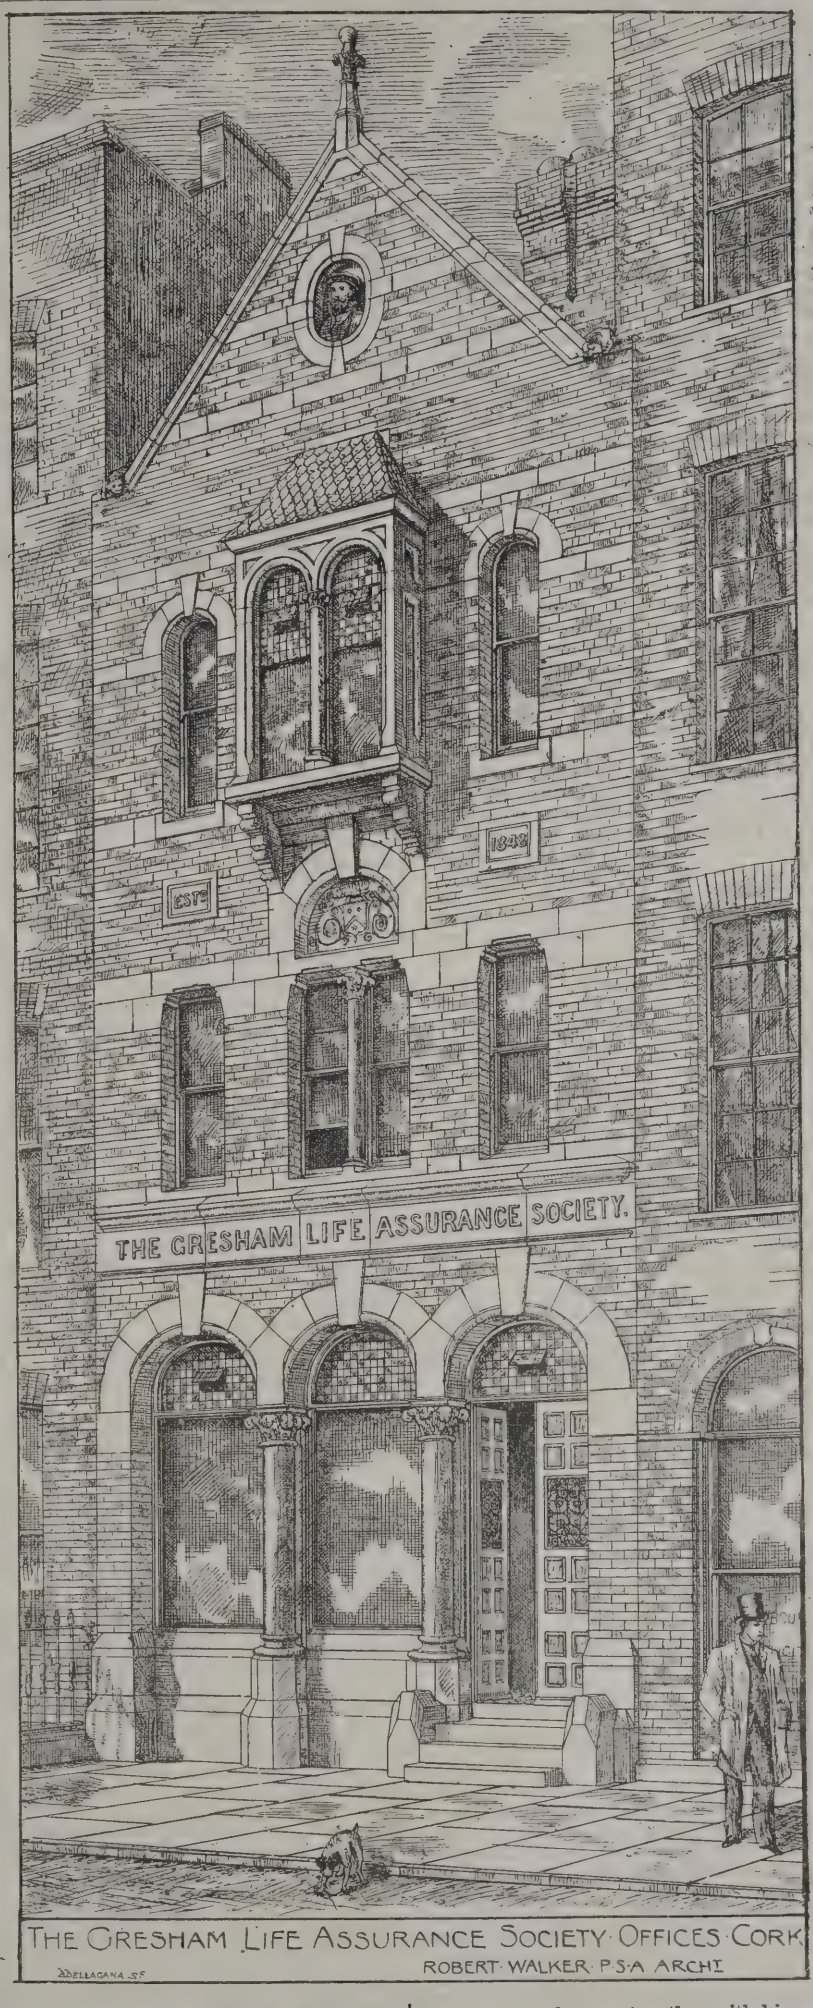
A special meeting of the Taunton town council was held on Monday, when it was decided to ask the Local Government Board to sanction a loan of £9,500 for the purpose of the waterworks, instead of £9,000, as previously applied for. Mr. F. N. Taylor was appointed engineer to carry out the extension of the works.

Thomas Harding, a builder, of Kentish Town, who shot and killed Florence Verney in the Victory public-house on May 21, will be executed on Tuesday next. He is thirty years of age.

GRESHAM LIFE ASSURANCE SOCIETY: NEW BRANCH OFFICE, CORK.

THIS office has just been finished; it occupies one of the best sites in the city. It is built with Youghal bricks, with facings of red bricks; cornices, barge, and dressings of local limestone, which is a charming colour, pale blue-grey, almost white; red Aberdeen granite columns; oak parquet floors laid by Turpin and Co., Queen's-road, Bayswater. The building has been erected by Mr. S. Hill, contractor, from the design and under the superintendence of Mr. Robert Walker, P.S.A., architect, of 17, South Mall, Cork.

CONTEMPORARY BRITISH ARCHITECTS.



[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

WE have now given fourteen sheets in this series, and the plate to-day is our fifteenth double-page group of living British architects. As this is the first number of our new half-yearly volume, we give below* a reference to the dates on which these former sheets of architects' portraits were published.

First on our accompanying plate is the photograph of Mr. Arthur Edmund Street, M.A., who was born in 1855, and was educated at Eton and Magdalen College, Oxford. He was a pupil to his father, the late G. E. Street, R.A., and has been in practice since the death of the latter in 1881. He has completed from his father's designs, or on his own account, a large amount of work in churches, schools, parsonage houses, &c., the most important work, perhaps, being the Church for the Americans in Paris, the designs for which the late Mr. Street had prepared in small-scale drawings. The building of the cathedral church, Halifax, Nova Scotia, is in Mr. Street's hands. He finished the Law Courts in conjunction with Sir Arthur Blomfield, A.R.A., and he published the life of his father a few years ago. Mr. Street frequently exhibits at the Royal Academy, and this year has two frames of his drawings at Burlington House. We published one in our pages for June 13th last, giving views of new schools, St. James's-the-Less, Westminster; the Guest House, East Grinstead, and the Thring Memorial Chapel, Uppingham. The other gives an interior of Halifax Cathedral before mentioned.

Professor Gerald Baldwin Brown, M.A., Oxon, was born on Oct. 31, 1849. He is the only son of the late Rev. J. Baldwin Brown, Independent Minister, of Clayland Chapel, Clapham-road, London, and was educated at Uppingham School under the late Rev. E. Thring. He took an open scholarship at Oriel College, Oxford, in 1869, and followed the regular Oxford course and graduated in 1873, taking a first class in Literæ Humaniories. Professor Brown gained the Chancellor's Prize in that same year for an English essay on "The Short Periods at which Art has remained at its Zenith in the various Countries." He was elected Fellow of Brasenose College, Oxford, in 1873, and resided for three years at Oxford, after which time he studied for the profession of a painter in London and Munich. In 1880 he was appointed to the Watson-Gordon Professorship of Fine Art in the University of Edinburgh, as the first occupant of the chair, which had been founded in honour of Sir John Watson-Gordon, R.A., P.R.S.A., by some members of his family. The work incidental to this appointment involves lectures on all branches of theory and history of architecture and the other arts of form. The lectures do not as yet qualify for graduation; but it is expected that the Royal Commission now sitting on the Scottish Universities will make arrangements by which attendance at the Watson-Gordon classes will count towards a University degree. The number of lectures given in a session varies in different years from 40 to 50 to 100. A large collection of examples is used to illustrate the themes dealt with. In 1886 Professor Baldwin Brown published "From Schola to Cathedral," a study of Early Christian architecture and its relation to the life of the Church (Edinburgh: David Douglas). He is also the author of several papers, &c., in the publications of the R.I.B.A., and elsewhere. He is an Hon. Associate of the R.I.B.A., and is a Fellow of the Scottish Society of Antiquaries, &c. His photograph, now reproduced, is from the studio of Mr. J. Moffat, of Edinburgh.

Mr. J. Tavenor Perry, of the firm of Messrs. Perry and Reed, was, together with his partner, a pupil of Professor T. Hayter Lewis, and on the retirement of the Professor continued to carry on

THE GRESHAM LIFE ASSURANCE SOCIETY OFFICES CORK.
ROBERT WALKER P.S.A. ARCHT.

* Jan. 3rd, 17th, 31st; Feb. 7th, 14th, 28th; March 7th, 21st; April 18th; May 16th, 23rd; June 6th and 20th, 1890.

his practice in the same offices. Among the principal works they have carried out since that period may be mentioned the following:—The scene-painting rooms for the Alhambra, the structural alterations of the dome and entire redecoration of the theatre, and, after its destruction by fire, its rebuilding on novel principles—the first serious attempt ever made to construct a building of this nature wholly of fire-resisting material; the north wing of University College, London, and the chemical laboratories in the rear, in continuation of the works already begun by Professor Lewis; the schools and vestry of the Chapel Royal, Savoy, for her Majesty the Queen; the drapery establishment at Chelsea for Mr. Peter Jones, costing about £70,000; the three blocks of flats in the centre of Kensington Court, for Mr. F. Baynes; the "Clapton Hall," for Mr. John Morley; works in the Chapel of the Augustinians, Bruges, Belgium; the residential flats and offices in the Wilhelmstrasse, Berlin, for the Union Assurance Society; the school-house, &c., for the headmaster of the Cathedral Grammar School, erected at the cost of the Dean and Chapter of Rochester. The Dean and Chapter of Worcester also employed them to report on the Refectory; in consequence of which, the firm prepared a scheme for certain restorations and additions thereto for the school. As surveyors to the Union Assurance Office they have frequently to superintend extensive reinstatements in London and the provinces. They are now engaged in rebuilding the Salisbury Estate, Strand, with a hotel and annexes, at a total estimated cost of £400,000. Mr. Tavenor Perry was the first appointed "Pugin Student," and afterwards published an account of his work in Durham; and was an Institute Silver Medallist and a "Sir Francis Scott" prizeman. Jointly with Mr. E. J. Tarver he originated, and for the first few years edited, the "Architectural Association Sketch Book." He also published the history of the two priories of St. Martin, Dover, he having been engaged on the restoration of the refectory of St. Martin. Mr. Perry's portrait was specially taken for our series by Messrs. Elliott and Fry.

Messrs. H. and D. Barclay are architects in practice in Glasgow. The senior partner, Hugh Barclay, entered the profession 45 years ago; his brother, David Barclay, entered with him as apprentice in 1861, and along with whom at the same time as a pupil was the late Mr. James Sellars, of Exhibition fame. Ten years later David became a partner of the firm, and they have been engaged largely in general business and in churches and schools. The Glasgow Academy, built twelve years ago, besides being of note architecturally, was regarded as a successful engineering feat in having been built on a new principle, the foundation being upon an embankment 30ft. in depth of forced earth alongside the river Kelvin. In 1879 they were successful in the competition for the Greenock Municipal Buildings, among 85 competitors, Mr. Chas. Barry being the adjudicator; the work has been completed at a cost of £120,000, and is considered in the architectural profession a great success. Mr. David Barclay has had the honour of being elected on two occasions to be honorary president of the Glasgow Architectural Association. He has been a member of the Glasgow Institute of Architects since its foundation, and was a member of Council for a number of years, and is a past vice-president of that body. He was offered the position of president, but declined the honour, contenting himself with the fact being recorded on the minutes. Mr. Hugh Barclay's portrait is by Mr. W. H. Gilchrist, Glasgow; and Mr. David Barclay's photograph was taken by Messrs. Brinkley and Stevenson, of the same city.

Mr. James Fowler, F.R.I.B.A., J.P., of Louth, was formerly diocesan surveyor for Lincolnshire. He was elected a Fellow of the R.I.B.A. in 1855, and has been four years on the Council. He has erected and restored many churches and parsonages in Lincolnshire, Notts, Yorkshire, Suffolk, &c.; his principal domestic works have been the restoration or almost rebuilding of Browne's Hospital, Stamford; the restoration and enlargement of Dingley Hall, Northants, for Mr. H. H. Hungerford; Morton Hall, Notts, for Mr. George W. Mason; Langton Hall, Lincolnshire, for Mr. B. R. Langton; Dalby Hall, Lincolnshire, for Colonel Preston, &c.; and amongst his more important churches we note St. Mary's, Newington; the Holy Trinity, Wanstead (see BUILDING NEWS for illustrations of this church, May 23, 1890); the Lonsdale Memorial Church (St. Mary's), Lichfield; the churches of St. Swithin and St. Andrew, in the City of Lincoln—the former has a fine spire; the restoration in part of the old palace at Lincoln for Bishop Wordsworth; the restoration of Heckington and Bolingbroke churches, recently illustrated in our pages; the restoration, &c., of St. James's Church, Louth; with the erection of the new church of St. Michael, in the same town; the Grammar School, Savings Bank, and other private works; the De Arton School, at Market Rasen, &c. Mr. Fowler has been previously three times Mayor of Louth, and at the present time is Warden of that borough, the office being equivalent to that of mayor, or head of the town. From the time of Edward VI. until the passing of the Reform Act, when a mayor and corporation was adopted, the term "warden" was used. The warden and assistants are the governors of the Grammar School and manage all its affairs. Mr. Fowler has taken an active interest in the annual excursions of the Architectural Association, and on several occasions has conducted the party over some of the more important buildings. The portrait given was taken for this collection a short time since by Mr. Thomas Fall, of Baker-street, W.

CHIPS.

A memorial tablet, bearing a medallion portrait of the late Right Hon. W. B. Dalley, has been executed by Sir Edgar Boehm, and will be unveiled in the crypt of St. Paul's Cathedral by the Earl of Rosebery on Thursday week, the 17th instant, at eleven o'clock. Mr. Dalley was Chief Secretary in the New South Wales Ministry at the time of the Soudan War.

The schools attached to Wycliffe Chapel, Totterdown, Bristol, are about to be rebuilt from plans by Messrs. Foster and La Trobe, of that city, at a cost of about £2,000. The new building will be erected in the rear of the present chapel. It will be Gothic in style, in harmony with the chapel, and will be constructed of red bricks, with stone facings. Accommodation will be provided for 800 children.

A new church, which has cost £4,000, and is the gift of Sir Pryce Pryce-Jones, the Conservative candidate for Montgomery Boroughs, in honour of his Jubilee knighthood, has been opened by the Bishop of St. Asaph, at Newtown. Mr. Aston Webb was the architect.

The Court of Common Council has abolished the office of keeper of the Monument, and has authorised the City Lands Committee to make arrrangements for the efficient control and management of the structure. It will be a surprise to many citizens to read that the average annual number of visitors to the Monument is 45,730, and the fees received amount to no less than £570.

On Tuesday last the Princess Louise opened a large new institute erected in the Buckingham Palace-road, S.W., from the designs of Mr. E. F. C. Clarke, of Victoria-street, at a cost of £13,000 to £14,000, for the lads and workpeople in the parish of St. Peter's, Eaton-square, Belgravia. The façade, situated next St. George's Baths, is executed in red brick, and is designed in a Renaissance style, simply treated, with entrances on either side, and a gable marking the centre of the elevation, which is enriched with pilasters, boldly dividing the arrangement of the fenestration. The Duke of Westminster granted the site at a nominal rent, but the requirements of the Grosvenor Estate restricted the treatment of the design materially. The accommodation includes a concert hall, a gymnasium, coffee and reading rooms, as well as a library, game rooms, and committee rooms.

A memorial tablet of alabaster, 9ft. in length by 4ft. in height, has been placed in Eignbrook Congregational Chapel, Hereford, in memory of the late Rev. J. Ormerod Hill, for 27 years pastor. It was designed by Messrs. Nicholson and Son, and executed by Mr. T. A. King, all of that city.

The Southampton Harbour Board decided last week to proceed with the extension of the quay, as authorised by the Acts of 1882 and 1887, at an estimated cost of £20,000. The work of preparing the plans was intrusted to Mr. James Lemon, J.P., C.E., with whom will be associated Mr. E. C. Poole, son of the surveyor to the harbour board.

Mr. T. H. Harrison, on behalf of the Local Government Board, conducted an inquiry, at the Public Offices, Wednesbury, on Friday, with reference to an application on the part of the town council for sanction to borrow £1,500 for works of paving, and £1,750 for the extension of the public offices. Mr. E. M. Scott, borough surveyor, and Mr. Kendrick, of the firm of Messrs. Wood and Kendrick, West Bromwich, architects of the Art Gallery buildings, gave evidence.

COMPETITIONS.

BATTERSEA.—For the Polytechnic Institution to be held in Battersea Park Road, the following architects have been invited to compete:—Mr. J. Belcher, F.R.I.B.A., Mr. C. A. De Boinville, Mr. H. C. Boyes, F.R.I.B.A., Mr. H. H. Bridgman, F.R.I.B.A., Mr. T. Chatfeild Clarke, F.R.I.B.A., Messrs. Henman and Harrison, A.R.I B.A., Mr. George Hubbard, Mr. J. M. MacLaren, Mr. E. W. Mountford, A.R.I.B.A., Mr. W. H. Seth-Smith, Mr. T. Osborne Smith, A.R I.B.A., Messrs. Roger Smith, Son, and Gale, Mr. Sidney R. Smith, A.R.I.B.A., Mr. E. G. Tarver, F.R.I.B.A., Mr. James Weir, F.R.I.B.A. Mr. Rowland Plumbe, F.R.I.B.A., of Fitzroy-square, the assessor, has prepared a detailed code of instructions. From the sets of designs submitted in this preliminary competition, six will be selected, the authors of which will take part in a final competition. Each of the half-dozen entering for the final competition will receive £50, and the architect placed first will be paid a premium of £400, including the sum just mentioned, which will, however, merge in his commission of £5 per cent. in the event of his being employed to carry out the building. The total cost of the building is not to exceed £40,000, and any design adjudged likely to exceed this one will be set aside.

HARROGATE. — A special meeting of the Harrogate Town Council was held on Thursday in last week, for the purpose of receiving the report of the assessor, Mr. George Corson, of Leeds, on the final Montpellier Baths plans competition. In the preliminary competition, twenty-six designs were submitted, and in the final four were selected to compete, a like number of premiums being offered. Mr. Corson presented his report, and recommended that the set of plans No. 13 be awarded the first prize, set No. 12 second, set No. 26 third, and set No. 17 fourth. In No. 13, the general arrangement was exceedingly simple and clear. The gentlemen's baths were placed in the west, and the ladies' baths on the east of the central hall, and were reached by wide, straight corridors, running east and west, with cross corridors running north and south. These open courts were introduced between the blocks to give light and ventilation. The w.c.'s in all cases abutted on external walls, and were lighted by windows in those walls, and the baths were similarly planned and lighted. The dressing rooms were lighted by windows above the level of the corridor roofs, and the various classes of baths in both departments were well distinguished and kept separate by their respective corridors. The Turkish baths were also kept separate in the south-east angle, and were entered through a vestibule in the central hall. The retiring rooms and sanitary accommodation for both sexes were very conveniently placed. The report having been unanimously adopted, the sealed envelopes were opened. The Mayor announced that the winners of the first prize, £150, were Messrs. Frank T. Baggallay and F. E. Bristowe, of Heddon-street, Regent-street, London; the second, £100, Messrs. W. Thomson and Frank T. Verity, of 11, Jermyn-street, London, and Mr. W. Phipson, engineer, of 14, St. John-street, Adelphi, London; the third, £75, Messrs. C. O. Ellison and Son, of 62, Dale-street, Liverpool; the fourth, £50, Messrs. Morley and Woodhouse, 269, Swan-arcade, Bradford. A committee of ten members was appointed to confer with Messrs. Baggallay and Bristowe, with power to call in Mr. Corson as professional adviser. The plans have been on view all this week from noon to 6 p.m., the exhibition closing to-morrow (Saturday).

The Dundee Town Council have formally acknowledged the receipt of a deed of gift of a public park to the inhabitants from Messrs. Cox Brothers, manufacturers, Lochee. The park is 25 acres in extent, and is in the Lochee district of the city. It is to be used solely for recreation purposes by the inhabitants of Dundee and Lochee in all time coming. The park cost £10,000, and the Messrs. Cox will, at an expense of £3,500, build a retaining wall and keeper's house, and give £2,500 as an endowment for the upkeep of the park.

An inquest was held on Monday at Manchester on the body of Michael Robinson, architect and surveyor, of Hollinwood House, Fallowfield, near Manchester, aged 71 years, who shot himself in his bedroon at his son's house on Friday evening. A verdict of "Suicide while insane" was returned by the jury.

Building Intelligence.

Beelsby.—The church of St. Andrew, at Beelsby, on the North Wolds of Lincolnshire, was reopened, after practically having been rebuilt, on Tuesday, the 1st inst. The work now done forms a nave, chancel, south chancel or vestry, and south porch. The aisle arcades of three arches are rebuilt in the walls, ready for use if required. The old chapel arch remains, and the west arch has been rebuilt, with a three-light window over it. The roofs are open-timbered, and unstained; the seats are varnished; the west gable is surmounted by a handsome bell gable, with spire terminal. The east window is of flowing Decorated work, and has been filled with stained glass as a memorial to a late resident. The building has been carried out by Mr. C. Baines, of Newark, and Mr. J. West, of Beelsby, under the direction of Mr. James Fowler, of Louth, architect.

Cardiff.—The Royal Hotel in St. Mary-street is about to be enlarged by the addition of a loftier block at the corner of St. Mary-street, Wood-street and Westgate-street. Mr. T. P. Jones, of Cardiff, is the architect, and the new block will be similar in style to the present one—viz., Renaissance, but will be carried out in Bath stone instead of plaster, the ground-floor frontage being of Portland stone with Aberdeen granite columns. The new block will be six stories in height, exclusive of a lofty mansard roof, containing offices, and will rise to 110ft. above the pavement level. The chief apartments on the first floor are the banqueting hall, 66ft. by 36ft. and 17ft. in height, two rooms *en suite*, each 18ft. by 30ft., a central hall 20ft. square. The builder's contract has been let to Messrs. E. Sheppard and Son, of Cardiff, for £25,000; Mr. Archibald D. Dawnay, of London-bridge House, has the contract for ironwork; and the carving is to be executed by Mr. Wormleighton, of Oxford.

Edinburgh.—A step towards the further completion of St. Mary's Cathedral, according to the designs of the late Sir Gilbert Scott, was taken on Friday, when the Edinburgh Dean of Guild Court approved of plans for the erection of a chapter-house at the north-east corner of the main building. The house will in size be about 36ft. square, and in style like the cathedral itself, Early Pointed. Light will be admitted by four windows on each of the three sides exposed. On the floor level the house will be square, but at the cornice level octagonal, while the roof, following the same form, will, at a height of over 70ft., narrow to a point, which will be surmounted by a cross. As to the interior, the roof will be elaborately groined—the moulded and carved ribs springing off decorated shafts, and having a central column of polished granite. Money for the erection of the house was left by the late Mr. Hugh J. Rollo, W.S., and the cost of the work will be about £5,000. It is expected that it will be completed in the early part of next year. The plans were prepared by Mr. John Oldrid Scott, F.S.A., son of the late Sir Gilbert Scott, and they are being carried into effect by Messrs. Morgan and Sons, contractors, Glasgow.

Fitzhugh, Southampton.—A new church, to be dedicated to St. Mark, is being built in the district of Fitzhugh, near Shirley. The contract has been placed with Messrs. Joseph Bull, Sons, and Co. (Limited) for the first section of the work at £4,921, the second section, for the fittings, being for £876. The church is to be built from designs by Messrs. J. E. K. and J. P. Cutts, of Southampton-street, Strand, W.C., and operations have been commenced by the builders during the past fortnight. To be built in the Decorated style, the church will consist of nave, with lean-to aisles, chancel, chancel aisle on the south side, narthex, with organ chamber on the north side of the chancel, and a vestry on the south. Accommodation will be provided for 696 people, distributed thus: nave, 424; aisles, 198; chancel aisle, 36; choir, 38. The extreme exterior length of the church will be 138ft., and breadth from wall to wall 63ft. 4in.; the interior measurement of the nave 80ft., and of the chancel 35ft. In width the nave is to be 31ft. 8in., and the aisles 10ft. 9in. From floor to roof-plate the height of the nave will be 35ft., and from ground to ridge 52ft. The aisles from floor to roof-plate will be 16ft. in height, and the chancel ridge is to be 2ft. lower than that of the nave. The church will be built of brick, with Doulting stone for dressings. The columns of the nave are to be of Portland stone. The flooring will be of wood blocks and laid on concrete. The roof will be tiled, and the line of the chancel arch will be surmounted by a flèche 20ft. in height. One special feature of the church is the narthex at the west end, approached on the north and south by porches and lobbies, the baptistery being placed in the centre, at the extreme west. The north-west porch will ultimately give place to a lofty tower and spire.

South Shields.—The Marine Parks, which were formally opened on Wednesday week, cover over thirty acres, and have been converted from waste sandhills and ballast heaps into picturesque pleasure-grounds, under the direction, and from the designs, of Mr. Matthew Hall, C.E., the borough surveyor, at a cost of £22,000, including the erection of a park restaurant and the formation of a road along the eastern boundary of the south park. The north park has been planted by Mr. J. Barns, the head gardener, and the south park by Mr. J. Peebles. In the open space between the parks is the memorial to William Wouldhave, the inventor of the lifeboat, which was first designed and built at South Shields in 1790. Its first stage is utilised as a fountain, with a basin surrounding it 22ft. in diameter, the water supply being on the north and south sides from large shells placed in semi-circular recesses. The water flows into bowls and overflows into the large basin. On the side towards the sea are placed two granite drinking fountains, with the entrance to the interior of the erection between them. The second stage contains on the west front a large medallion of Wouldhave, with the borough arms beneath, and on the east front a medallion of Greathead. A tablet on the north side has sculptured upon it the representation of the launching of the lifeboat to save the crew of a ship in distress in the distance, and on the south side is a representation of the shipwrecked and the return of the lifeboat containing the saved crew. The third stage contains a clock with four dials, by Messrs. T. Potts and Sons, of Leeds. The memorial is 10ft. square at the base, and 45ft. high. Its construction has been carried out by Mr. J. B. Farbridge, monumental mason, of South Shields, from the drawings, and under the superintendence, of Mr. J. H. Morton, F.R.I.B.A., of the same town.

Selby Abbey.—Within the past week two discoveries have been made in connection with the restoration of the south wall of the Abbey Church of Selby, now in progress under the direction of Mr. J. Oldrid Scott, F.S.A. The first was the discovery of a part of an old gravestone bearing the date of 1716. This clearly shows that part of the church which was destroyed by the fall of the tower in 1690 was rebuilt towards the end of the last century, and not in 1702, as was generally supposed. The tombstone bears the name "Merebeck." The latter discovery is more interesting. Certain foundations have been found, indicating the existence on the east side of the south transept of a Norman apsidal chapel extending eastward from the old Norman south transept. The work on this part of the restoration has been suspended for a few days, until Mr. Scott is able to inspect the foundations. There are indications of the Norman, the Decorated, the Perpendicular, and modern work in the foundations of the south wall, the present restoration being evidently the fifth that has taken place in that particular portion of the church.

Whitby.—A number of memorial stones were laid on Friday in connection with the new Brunswick Wesleyan Chapel. The old chapel, which was opened in 1814, is now being demolished, being no longer suitable, and the new one will be built on the site, on the transeptal plan, shallow galleries being provided on three sides. The seats will be arranged to accommodate about 900 worshippers, over 500 being on the ground floor. The orchestra will occupy a position to the rear of the building. In addition there are to be three vestries and a ladies' parlour and band-room. There are also to be a school, designed to accommodate 450 scholars, five class-rooms, and a room for 90 infants. The style of the building is the Romanesque of Southern France. The architects are Messrs. W. Waddington and Son, of Manchester and Burnley. The estimated outlay, including entire cost of building, draining, fencing, lighting, and warming, is about £6,000. The contractor for the work is Mr. John White, of Whitby.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLVI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Roof Principal.—To "X. Y. Z." (The roof, a sketch of which you send, will answer the purpose; the upright struts should be trussed if there are no cross walls to rest them on at intervals. You do not give length of roof or the distance of principals apart. Roof Boarding.—(The diagonal mode of laying boards gives greater strength and is more durable than the horizontal mode.)—T. H. M.—Levelling Instrument. (The small level shown in our article (p. 378, 1889) was made to order from an architect's design, but is not sold. Any skilful instrument maker could supply a similar instrument. The level could be made for about 30s.)

Received.—G. W. Co.—W. O. and Son.—C. S. and P.—G. B.—H. T. and Co.—C. of S. on S.—W. Bros.—H. A. and Son.—J. T.—M. and Co.

Correspondence.

ARCHITECTS' PROPERTY IN PLANS.

To the Editor of the Building News.

Sir,—In your last week's Building News you say, "Houses of Parliament plans" and the case, "Ebdy *v.* McGowan," "represent the legal mind on this question, and have indeed made it illegal for an architect to refuse to give up the plans that he has made and been paid for" (?)

In the case of the "Houses of Parliament" plans, the understanding arrived at "by private arrangement" (if I am correctly informed) was that 1st, Plans of unexecuted work remain the perty of the architect" (?)

2nd. Plans of work executed belong to the proprietor.

In the case "Ebdy *v.* McGowan" the account had three clauses:—

1st. Charge for plans, details, spec., &c., for a church not built, but estimated for.

2nd. Charge for plans and services for No. 2 church as erected.

3rd. Charge for plans, details, spec., &c., for a vicarage house, stabling, &c., tendered for, but not built.

The rock upon which the plaintiff and defendant split was the ownership of plans "before the work was executed." The first trial was decided in favour of the "architect's account in full." A rule *nisi* was granted McGowan for a new trial to decide the question of "ownership in plans."

The solicitors on either side (without consent)—the defendant (Ebdy) not being present or consulted by telegram—made a compromise by keeping all plans and allowing commission for vicarage to be deducted from the account, but not commission for No. 1 church, not executed. "Result: drawn battle"—"case not decided by law" (?).

McGowan paid all his law costs and hotel expenses out of the church building fund, and had a balance left.

The Northern Institute of Architects started a subscription list to pay the defendant's (Ebdy) "out-of-pocket costs" (?). Perhaps the hon. sec., Mr. Thos. Oliver (Newcastle-on-Tyne) will be able to give some information how the Profession responded to the printed circular?

The case as settled stands thus:—

Plans for executed work not asked for (!). Church No. 2.

Plans of unexecuted work retained. Church No. 1.

Plans of vicarage retained (unexecuted), and commission struck out of account (by solicitors, without architect's authority). Result: no legal decision.—I am, &c.,

June 30. EBDY.

PROFESSIONAL HUMBUGS AND COMPULSORY EXAMINATION.

SIR,—It is often remarked that the architectural and kindred professions are overcrowded. It is no doubt quite true that the supply, even of highly qualified men, exceeds the demand for their services; but the state of affairs is made very much worse by the very large number of humbugs who suddenly take it into their heads to style themselves architects, surveyors, or sanitary engineers. When joiners, bricklayers, and plasterers style themselves architects and surveyors, and commercial travellers lay aside their samples and assume the title of sanitary engineer, it is high time something was done to put a stop to such a mischievous practice. By all means, I say, let us have an examination or

SOMETHING EQUIVALENT.

CHIPS.

On Sunday special services were held by the Welsh Baptists of Ynysybwl upon the occasion of opening their new edifice, which has been erected at a cost of £1,200. It is capable of seating 700 people, and is built by Messrs. Charles Jenkins and Sons, Porth, under the supervision of the architect, the Rev. Dr. Roberts, Pontypridd.

Alterations have been made to the West End Hospital, Marylebone-lane, embracing the ventilation, which is now carried out on the Boyle system.

Mr. J. Williams Dunford, M.S.A., has resigned his position as official architect to the Salvation Army. He has carried out over £80,000 worth of work for that organisation during the last two years. On leaving, he was presented by his staff, numbering twenty-nine, with an illuminated address and other interesting souvenirs. His new offices are at 100c, Queen Victoria-street, E.C., where he commences private practice.

The Prince of Wales will lay the memorial stone of the new nave of the Church of St. Saviour's, Southwark, which is about to be rebuilt from Sir Arthur Blomfield's designs, on the 24th inst.

Mr. R. H. Wood, of Rugby, having given a building to the town for an institute and museum, a public meeting was held on Monday night, and the Free Libraries Act was unanimously adopted.

The "Descent of the Holy Ghost" has been selected as the subject of the east window which is to be placed in the parish church of Wednesbury, in memory of the late Mrs. Richards, who left £1,000 towards the restoration expenses. Mr. Basil Champneys, B.A., is engaged in the preparation of designs for a reredos of Derbyshire marble, which is to be placed in the church at the cost of an anonymous donor.

The Tottenham and Forest Gate Junction Railway Bill was passed on Monday by a Committee of the House of Lords, and ordered to be reported for third reading, with some amendments.

During the half of the present year which closed on Saturday, there have been approved of by the Improvement Committee, Belfast, plans for 1,936 new edifices, a larger number than was ever passed during the whole of any previous year in the history of the city. Among them were plans for several churches and a number of large warehouses, but the great majority were artisans' dwellings.

Vauxhall Park, South Lambeth-road, will be opened by the Prince of Wales on Monday next.

Intercommunication.

QUESTIONS.

[10307.]—**Colouring Cement.**—Can anyone give particulars of a process for colouring cement grass-green permanently by means of a pigment mixed with it?—W. BEESTON.

[10308.]—**Architect's Responsibility.**—Will some reader kindly say if an architect can be held responsible for defects to a building which has been completed more than five years, and for which no previous claim has been made, and, if so, has he a counter-claim against the builder, who, in the matters complained of, did not carry out the work properly or in accordance with the specification? Reply will much oblige—AN OLD SUBSCRIBER.

[10309.]—**Devonshire Churches.**—Would some of your readers kindly advise me as to churches of the Gothic style, &c., in Devonshire which are worth studying and taking measured drawings.—C. H. S.

[10310.]—**Quantity Surveying.**—Can any of your readers kindly inform me as to how the following items are usually measured by modern London quantity surveyors? Deduction of stone sills and strings from brickwork. Banister Fletcher, in his work on Quantities, page 14, states that "No deduction is made for window-sills or strings *under* 6in. in height." Whereas "Leaning," in his work, page 30, states that "Stonework is not deducted unless *over* 6in. in height." So that, according to Fletcher, a 6in. sill would be deducted, but, according to Leaning, not. Also in the measurement of fir in floors and roofs, Fletcher states, on page 51, "Where timbers are framed—that is, mortised and tenoned—they must be kept separate from the works that are only fixed. . . . . In quantities all works are understood to be fixed, unless stated to the contrary, and would include the nailing, lops, dovetails, &c." Whereas Leaning, on page 57, states, "All floors are taken as framed except ground-floors, and fir framed in roofs as purlins, ridges, valleys, hips, dragon pieces, rafters." Which of the above rules is generally followed in London? As a matter of fact, in all single-joist floors the only parts mortised and tenoned are the timbers trimmed to fireplaces, &c., and the same applies to roof timbers (excepting the tenons, of course). In addition to paying for tenons as "fir framed and fixed in tenons," should they be paid for also by number for hoisting? The authorities appear to differ on that point.—PROVINCIAL.

[10311.]—**Civil Engineers' Fees.**—What would be a fair price to pay an engineer for constructing a road through a wood? Road would be three-quarters of a mile long, 20ft. wide, and varying in depths from 1 to 5ft. I want him to prepare all necessary plans, quantities, estimate, and contracts, and to visit the works every fortnight. Is there a fixed scale?—TO DO AS I WOULD BE DONE BY.

[10312.]—**Gothic Vaulting in Plaster.**—Would one or other of your readers oblige with particulars how best to carry out Gothic vaulting in plaster secured to woodwork?—what description of plaster or cement, what method of suspending the same from couples, say 12ft. apart, and crossing a 30ft. span?—SUBSCRIBER.

REPLIES.

[10303.]—**Area of Segment of Circle.**—In answer to Arthur Shaw, the simplest method is:—Take two-thirds of the chord, then add the square of the versed sine divided by twice the chord, then multiply their sum by the versed sine = area.—H. RAVEN.

[10306.]—**Tall Chimney.**—Your correspondent will find in constructing caps for tall chimneys the plainer and simpler the better, for at such a height as 180ft., which "J. T." gives, you could not see the detail. If your correspondent procured "Bancroft's Tall Chimney Construction," which is advertised in the BUILDING NEWS, he will see a litho. plate giving a variety of caps. He will also read, in chapter under head "Caps," that much expense is often incurred by having too elaborate a finish to the top of a tall shaft.—J. JACKSON.

The restoration of Dunblane Cathedral, once the scene of the labours of the saintly Scottish Archbishop Dr. Leighton, makes satisfactory progress under the direction of Dr. Rowand Anderson, of Edinburgh. Particular attention is being paid to the lower parts of the western gable, with the great west window, surmounted by the bay-leaf window, made famous to this generation by Mr. Ruskin's description and praise. The cathedral has been illustrated in the BUILDING NEWS for May 20 and Oct. 14, 1870; Dec. 14, 1878; and July 23, 1885.

It is proposed to form a "Methodist Settlement" in Bermondsey, at an outlay of about £8,000 for buildings. In the plans, which have been prepared by Mr. Elijah Hoole, accommodation is provided for a warden and twenty residents. The building will contain a lecture hall, library, class-rooms, a large gymnasium, a workshop, a chemical laboratory, a tennis ground, a swimming bath, and provision for Evangelistic services.

The foundation stones of a new Wesleyan chapel and school were laid in Pallance-road, Northwood, Isle of Wight, on Wednesday week. The chapel will be Gothic in style, and will be seated for 100 worshippers. The schoolroom will accommodate 70 children. Mr. S. E. Tompkins, of Sandown, is the architect, and Messrs. Ball and Son, of West Cowes, are the builders.

Viscount Portman has presented the collection of fossils at Hestercombe, his place in Somersetshire, which contains 20,000 specimens, to the Somerset Archæological Society, and it will be placed in the Taunton Museum.

LEGAL INTELLIGENCE.

SAUNDERS AND COLLARD V. THE BROADSTAIRS LOCAL BOARD.—The proceedings in connection with this action came to a termination before the Official Referee on Friday last, when the decision was in favour of the Local Board for £4,579, as damages for defective work in connection with the drainage of the town, excessive charges, and false measurements. The decision involves Messrs. Saunders and Collard in the payment of the costs of action, and the Official Referee refused to stay execution.

DAMAGES FOR NEGLIGENCE AGAINST ARCHITECT AND CONTRACTOR.—WAIN V. OLDREY AND CO. AND MILLER.—(Queen's Bench Division, July 2.—Before Mr. Justice Mathew and a Special Jury.)—In this case Mrs. Eliza Wain, a widow, sued under Lord Campbell's Act for compensation for the loss of her husband, Alexander Wain, a bricklayer, who sustained fatal injuries on November 9, 1888, from the fall of a house in the course of construction at the corner of Titchfield-street and Ridinghouse-street, Oxford-street, which, as recorded in our columns at the time, caused serious hurt to fifteen persons and the death of five, including the plaintiff's husband, and which the plaintiff alleged was due to negligence on the part of both the defendants—Messrs. Oldrey and Co., the builders, and Mr. Miller, the architect, who was also clerk of the works. The defendants denied negligence and liability.—Mr. Willis, Q.C., and Mr. W. Graham were counsel for the plaintiff; Mr. Muir Mackenzie and Mr. Scarlett being for the defendants. The alleged negligence had reference to the construction of the building and to the fact of some 30,000 bricks having been stored on the ground floor. The jury considered both defendants responsible, and returned a verdict for the plaintiff for £250. Mr. Justice Mathew gave judgment accordingly, with costs.

PARLIAMENTARY NOTES.

THE TATE COLLECTION.—Dr. Farquharson asked the Chancellor of the Exchequer, on Tuesday, whether the Trustees of the National Gallery accepted Mr. Tate's generous offer subject to the condition that the Government should provide sufficient space to accommodate the pictures, and whether the Trustees had repeatedly pressed on the Government the desirability of enlarging the existing building? The Chancellor of the Exchequer said it was true that the Trustees of the National Gallery had repeatedly urged on the Government the desirability of enlarging the existing building, and arrangements had been made for providing additional accommodation with a view to a permanent gallery for British art.

STATUES, MEMORIALS, &c.

NORTH BERWICK.—There has been erected at North Berwick a granite cross, commemorative of the brave act by which Miss Catherine Watson, of Glasgow, sacrificed her life last summer in rescuing a boy from drowning. The place selected for the erection of the cross is close to the shore, and between the East and West Bays. The cross is purely Celtic in style. It has been wrought out of a single block of red granite, and measures 14ft. long and 39in. wide at the arms. The front is carved with ornament of a strictly Celtic type, while the back and edges are wrought out harmoniously with the front. In a panel formed at the foot of the cross is an inscription carved in raised letters. With a view to giving elevation, and forming a base for the cross, it has been placed upon a large boulder which was brought up from the beach. Upon the front of the boulder is to be placed a medallion of Miss Watson. It is being executed in bronze, and is the gift of her fellow-students in the School of Arts, Glasgow. The whole monument, which has an elevation of about 20ft., has been placed on a mound. It is to be surrounded with a stone cope, surmounted by an iron railing. The design was prepared and the work carried out by Messrs. S. M'Glashen and Son, Canonmills Bridge, Edinburgh.

The new tower at Clifton College, Bristol, which completes the college buildings, has been opened at this year's commemmoration. It contains three spacious rooms, which will serve as the council-room, the sixth-form room, and the natural-history school. The mosaic picture, reproducing Mr. Holman Hunt's painting of "Christ in the Temple," is now placed in the chapel as a reredos in an alabaster frame. Messrs. Dunn and Hansom, of Bristol, are the architects.

The Swansea Steam Joinery Company's Works, Strand, Swansea, were completely destroyed by fire on Monday. The damage is estimated at £4,000.

The alterations and improvements at Barnwell Castle, to the amount of £3,000 have been intrusted to Mr. George Henson, of Wellingborough, the contractor for the Nene Bridge.

Our Office Table.

YESTERDAY the popular and hard-working past-president of the Architectural Association, Mr. Herbert D. Appleton, F.R.I.B.A., changed his name, and married Miss Searleswood, whose patronymic he has adopted. We gave Mr. H. D. Searleswood's portrait with biographical notice in our issue of March 21st last. We assure him of our congratulations.

IN Sir James Gowans, who died on Wednesday week at the age of sixty-nine, the City of Edinburgh has had an almost ideal Lord Dean of Guild. His early training in an architect's office, his long and successful career as a builder and railway contractor, and his services from 1868 to 1880 as chairman of the Public Health Committee of the Edinburgh Town Council eminently qualified him for the Guildry chair of that city, which he has occupied for the past five years. His large practical experience of all kinds of building operations enabled him to detect at once imperfect and objectionable points in the plans for new buildings and alterations submitted to the court, and his mingled firmness and vigour and power to grapple with details were brought to bear on everything which came before him. "Light and Air" was his favourite text, and he insisted on ample ventilation and lighting, refusing to pass plans which did not comply with his views. Among his works as a railway contractor may be mentioned the sections of the Highland system between Dunkeld and Ballinluig and Dalwhinnie and Boat-o'-Garten; the Edinburgh and Bathgate line, that to North Berwick, the Dundee and Newtyle line, and the Crieff branch of the Caledonian system. He essayed to solve the problem of how to house the working classes comfortably at a remunerative rate, and designed and built many dwellings in Edinburgh. The building now known as the Synod Hall was erected as a West-end theatre, and proved an unfortunate speculation for him and for many others. As contractor to the Edinburgh Street Tramways Company he constructed all the lines originally laid by them. He was knighted four years ago, on the occasion of the Queen's visit to the Edinburgh Exhibition, and in the disposal of the surplus of that undertaking the committee acknowledged his energetic efforts to insure its success by presenting him with £2,000, an act which was much criticised at the time.

THE annual meeting of the British School of Archæology at Athens, was held at Burlington House on Wednesday, under the presidency of Mr. F. C. Penrose, F.S.A. Mr. G. A. Macmillan, the hon. secretary, read the report. The session now ended had been the most successful the school had yet held. Twelve new students had been admitted, and important excavations had been begun upon the site of Salamis, and valuable contributions to our knowledge of ancient art and ancient life might be expected. The school had also undertaken excavations on the site of Megalopolis. Mr. R. W. Schultz and Mr. Barnsley had continued during the past session their previous labours on Byzantine architecture. As to the financial condition of the school, if its present income of £440 were absolutely assured, it might at least hold its own, though under ordinary circumstances that sum would do hardly more than provide the salary of a competent director. If only by endowment or by annual subscriptions a permanent income of £600 or £700 a year could be assured, no one need doubt that the British School at Athens would amply justify its foundation. He moved the adoption of the report, which was seconded by the Bishop of Southwell. Sir C. T. Newton moved and Sir George Bowen seconded the appointment of officers of the society. The Director (Mr. E. A. Gardner) read his annual report, in which he said that the British School was twice as numerously attended as any of the foreign schools at Athens. Mr. Tubbs read his account of the work of the Cyprus Exploration Fund during the past year, and Mr. Loring read his report of the labours undertaken at Megalopolis.

ACCORDING to a correspondent of the *Standard*, researches as to the advantages of whitewashing the walls of rooms inhabited by persons suffering from contagious maladies, have lately been conducted by Dr. Giaxa at the Hygienic Institute of Pisa University. It was desired to establish what influence whitewash or limewash might have on the microbes of tuberculosis, typhoid, carbuncle, and other diseases. Portions of walls were smeared with substances adapted to the development of the microbes, were then infected, and afterwards covered with a coat of whitewash. Twenty-four hours afterwards these portions—from which all external agents had been carefully excluded—were examined. It was found that the bacillus of tuberculosis, carbuncle, and some other diseases resisted even renewed applications of whitewash; but that the cholera and typhoid microbes were destroyed by one application.

THE Roman pavement at Woodchester, which is unsurpassed among those yet found for beauty of design and richness of colouring, is about to be uncovered, and will remain so from Tuesday, the 29th inst., till Monday, August 11, inclusive, during which time it will doubtless be visited by numbers who had not the opportunity of seeing it when it was opened for a short time ten years ago, as well as by many who then saw it and will be glad to visit it again. It is within two miles of Stroud, on the Great Western line, and only about ten minutes' walk from Woodchester Station, on the Midland branch line.

SIR WM. FETTES DOUGLAS, the president of the Royal Scottish Academy, has received from Mr. William McEwan, M.P., a donation of £5,000 for the purchase of pictures for the National Gallery at Edinburgh. Mr. McEwan has, the *Scotsman* states, had in view the purchase of some important picture for the National Gallery, and it was his desire, if possible, to get a Rembrandt, of whose works he is an admirer. He has now, however, intrusted the selection of the picture to Sir William Fettes Douglas, and though an effort will be made to secure a Rembrandt, should one turn up at a price within the amount of the donation, should Rembrandt's pictures continue to fetch the fancy prices which have recently been reigning, the money will be applied to the purchase of one or two, or even three, pictures of more moderate cost.

THE annual report of Mr. J. W. Brown, the borough engineer and surveyor of West Hartlepool, states that the past year has been marked with much activity in nearly all the departments of the corporation, and while much has been done, there remain many works to complete, and several schemes of considerable importance are still under the consideration of the council, such as the sea-wall and esplanade, new abattoirs, market improvement, new town-hall, &c. The total length of public highways has been increased from 13⅝ to 14½ miles, while £5,807 has been expended in constructing streets not yet taken over from owners of property. During the twelvemonth 238 certificates for occupation were granted, as compared with 139 in the previous year.

MR. E. H. SHORLAND, of St. Gabriel's Works, Erskine-street, Manchester, has just published a new catalogue of his various patented warming and ventilating appliances. First in the catalogue come the well-known warm-air ventilating "Manchester grates," which are shown in a variety of designs, some suitable for schools, hospitals, and other public institutions, and others for private houses, these grates being made in almost any design from the plainest to the most ornamental and costly. After the Manchester grates come the inlet and exhaust roof ventilators, and we notice several new designs amongst them. These ventilators are made in galvanised rolled steel, iron, and zinc, at almost all prices, and are in great demand. After the ventilators come the "Manchester stoves," which are so largely used in hospitals and other public buildings. They are shown with tiled sides, in various designs, and with either ascending or descending smoke-flues. They are also made "double-fronted"—*i.e.*, with a fire at each end. The long list of places where Mr. Shorland has recently supplied his patent Manchester grates and stoves fully proves their popularity.

Mr. Samuel Harris has presented a new church, called the Church of the Martyrs, to Leicester. It is situated on the west side of the river, and was planned by Mr. Christian. There will be accommodation for 700 persons. The cost is over £10,000.

The Duke of Clarence opened at Scarborough, on Friday, the new marine drive and promenade, which have been completed at a cost of £42,000.

Trade News.

WAGES MOVEMENTS.

NORTH SHIELDS.—The operative stonemasons at North Shields have come out on strike for an advance of wages, demanding 8½d. per hour instead of 8d., which has hitherto been paid. The masters are generally opposed to any concession.

EDINBURGH AND LEITH.—A meeting of the Edinburgh and Leith joiners was held in the Trades Hall on Friday night to receive the report of the committee appointed some time ago to draw up rules for the formation of a Board of Conciliation. The rules having been submitted, they were at considerable length discussed, and after slight amendment the secretary was instructed to forward them to the Employers' Association for their consideration.

CHIPS.

Mr. John Page, chief engineer of the Dominion Canals and the projector and constructor of the enlarged St. Lawrence Canal system, died at Philadelphia on Wednesday in this week.

At a meeting of the South Wales University College at Cardiff on Wednesday, Mr. Archibald C. Elliott was elected to the Engineering Professorship just founded at Cardiff. He will enter on his duties in October.

A new mortuary is being built for Liverpool at the south end of the Prince's Dock. It is of red brick, in four separate compartments, and is modelled on the plans of the Morgue at Paris. Mr. J. A. Berrington, A.R.I.B.A., is the architect.

A set of new mosaics were unveiled at the church of the Holy Name, Oxford-road, Manchester. The mosaics, which are placed in the panels of the new pulpit, represent the English martyrs (Blessed Thomas More, Blessed Edmund Campion, S.J., and Blessed Cardinal Fisher).

The foundation stone of a new church for Westcombe Park was laid on Saturday. The building will, when completed, have sitting accommodation for 800 persons, and the total cost, including nave, chancel, and boundary walls, will be £8,000. The interior will be of red brick, relieved with stone dressings, and a tower 150ft. in height is included in the plans.

A portrait of Mr. Cadge, surgeon, of Norwich, painted by Professor Herkomer, R.A., was presented to the Norfolk and Norwich Hospital on Saturday.

The Oxford congress of the British Archæological Association will be opened on Monday next by an address by the Earl of Winchilsea and Nottingham, past president.

A new church, dedicated to St. Peter, was opened at Ely on Monday by the Bishop of the Diocese. The building has been erected by Mrs. Sparke, in memory of her husband, the late Rev. Edward Bowyer Sparke, Canon of Ely, at a cost of £4,000, and provides accommodation for 250 persons. The architects are Messrs. J. P. St. Aubyn and Wadling, of the Middle Temple.

The Mayor of Maidenhead has presented his estate known as Kidwells Park to the borough for a recreation and pleasure ground. The park is 12 acres in extent, is situated in the heart of the town, and is estimated to be worth £12,000.

A new organ, which has been erected at the Horkinstone Baptist chapel, Oxenhope, by Messrs. Driver and Haigh, of Bradford, was opened on Saturday. The organ, which has 21 speaking stops and nearly 1,200 pipes, has cost about £270, and the organ chamber £70.

The Royal Infirmary at Liverpool, now in course of erection from designs by Mr. Alfred Waterhouse, R.A., will be opened by the Duke of Clarence and Avondale in October next.

It is proposed to unveil the effigy of the late Archdeacon Iles placed in Lichfield Cathedral on Thursday, the 17th inst.

The sale of the "Farnley Turners" has illustrated afresh the value of high-class works of art as an investment. The Rhine sketches fetched £5,434 on Friday; the original purchaser gave Turner £500 for them.

New public baths for Gorton, built at a cost of £4,500, were opened on Saturday. Mr. T. H. Maybury, of Booth-street, Manchester, was the architect.

Holloway's Ointment and Pills exercise priceless power over Lumbago, all pains of the muscles, nerves, and joints, and quickly reduce all swellings caused by accidental injuries, weakness, or hereditary taints. The intelligible instructions enveloping Holloway's medicine give full counsel for using it most advantageously for regaining health, strength, and mobility.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

ELECTRIC LIGHTING.

COMPLETE INSTALLATIONS OR WIRING ONLY { ESTIMATES GIVEN.

STRODE & CO. 48, Osnaburgh-st., N.W., and 67, St. Paul's Churchyard, E.C. LONDON.
New Branch Showrooms:—188, PICCADILLY, W.
Telephone No. 3958.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY.

SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W.

WM. OLIVER & SONS,

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BANGOR.—For the erection of a pavilion for the National Eisteddfod of Wales, to be held in Bangor city in September next. Mr. W. Lloyd-Jones, architect:—
Williams, E. (accepted)

BASFORD.—For proposed additions to Basford brassworks for Messrs S. Smith and Son. Mr. A. H. Goodall, Nottingham, architect:—

Hutchinson, J.	£545 0 0
Slight, G. S.	542 5 0
Pinket, W.	530 0 0
Wheatley and Maule	525 0 0

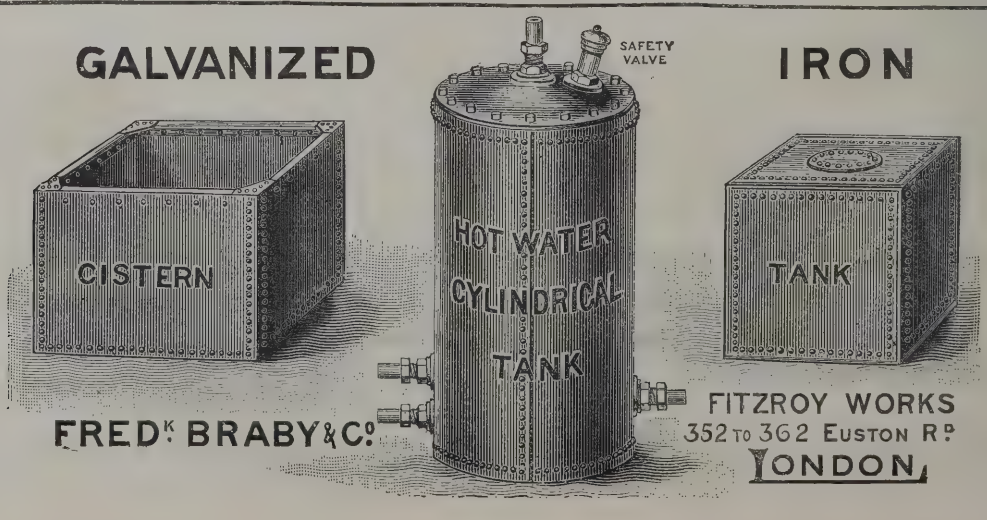
JENNINGS' PATENT BALL TRAPS

For Lavatory, Bath, and Overflow Wastes.

THESE TRAPS (which consist of Indiarubber Balls fitting on seatings of the same material) possess **important advantages** over the ordinary kind; they constitute a **perfect seal** against back pressure; are **not** affected by absorption, evaporation, or siphonage, and are efficient under all conditions. They are made of various sizes, from 1in. to 2½in., and can be seen at the Works, where they may be subjected to experiments to test their efficiency.



Prices and particulars on application to

GEORGE JENNINGS, Sanitary Engineer, Stangate, S.E.

Patentee and Manufacturer of Improved Tip-up Lavatories, Baths, Water-closets, Sinks, Urinals, Pumps, Hydrants, Sluice Valves, and Water Fittings of every description.

AWARDED THE GOLD MEDAL, PARIS EXPOSITION, 1889.

GALVANIZED IRON

FRED^K BRABY & C^O.
FITZROY WORKS
352 TO 362 EUSTON R^D

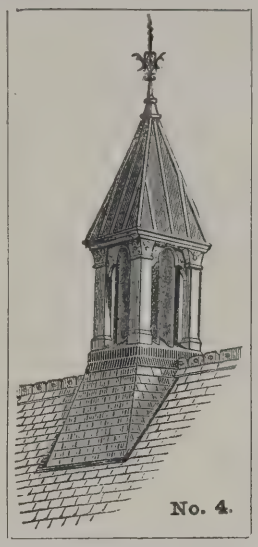
ROBERT BOYLE & SON'S

Latest Improved Patent (1882)

SELF-ACTING AIR-PUMP VENTILATOR.

(PERFECTED OCTOBER, 1887.)

50 PER CENT. REDUCTION IN PRICE.



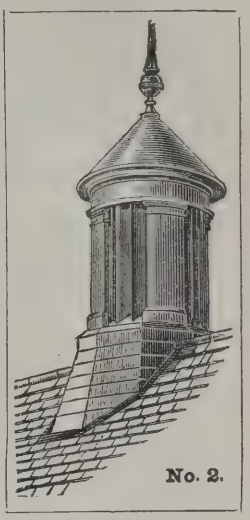
No. 1.
Registered Design.

The most Powerful Exhaust and

CHEAPEST VENTILATOR IN THE MARKET.

IMPERVIOUS TO WET AND DOWN-DRAUGHT.

Strongly made of the Best Steel, Galvanised, and Finest Workmanship.



No. 4.

CAUTION TO ARCHITECTS.

FRAUDULENT SUBSTITUTION.

Having received complaints alleging the failure in certain cases of the Air-Pump Ventilator, upon examination being made it was found in every instance that the contractor had substituted (to secure a greater profit to himself) a cheap and inferior Ventilator resembling, in outward appearance, the Air-Pump Ventilator which had been specified to be used.

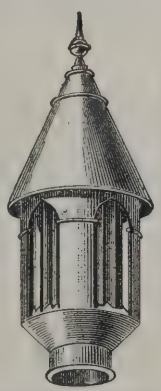
It is respectfully requested that, in specifying the Ventilator, the words "ROBERT BOYLE & SON'S LATEST IMPROVED PATENT SELF-ACTING AIR-PUMP VENTILATOR" be used.

No. 2.

ROBERT BOYLE & SON'S

Latest Improved Patent (1882)

SOIL PIPE, DRAIN, & SEWER VENTILATORS.

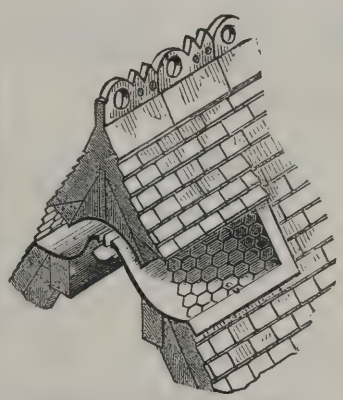


The Cheapest and most efficient in the Market.

FROM **12s.** EACH.

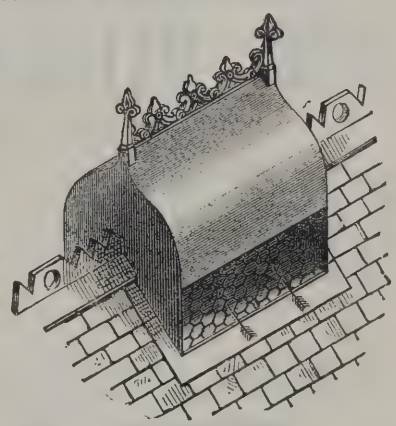
Approved of and used by Baldwin Latham, C.E., Bailey-Denton, C.E., W. Eassie, C.E., and by all the leading Architects, Sanitary Engineers, Builders, and Plumbers in the United Kingdom.

SOIL PIPE VENTILATOR.



DRAIN OR SEWER VENTILATOR.

ROBERT BOYLE & SON'S

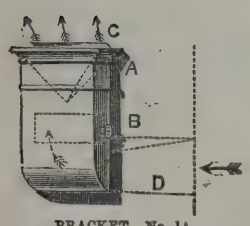


Latest Improved Patent (1882)

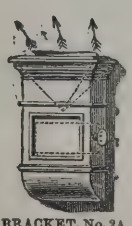
CONCEALED ROOF AND RIDGE VENTILATORS.

The most reliable and powerful Ventilators of their class in existence.

CONCEALED ROOF VENTILATOR.



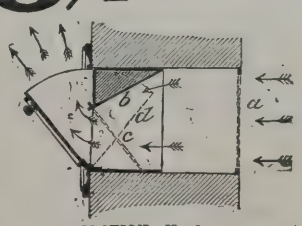
RIDGE VENTILATOR.



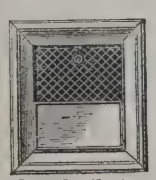
ROBERT BOYLE & SON'S

LATEST IMPROVED AIR INLET BRACKETS AND WALL PANELS,

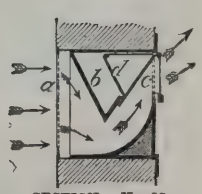
FROM **10/-** EACH.



BRACKET. No. 1A.



BRACKET. No. 2A.



PANEL. No. 2B.

SECTION. No. 2B.

PANEL. No. 3C.

SECTION. No. 3C.

N.B.—All the above Appliances are Manufactured solely by us, and none are genuine unless they bear our Registered Title and Trade Mark, any Infringement of which involves a penalty of Two Years' Imprisonment.

Registered Title SELF-ACTING AIR-PUMP VENTILATOR and Trade Mark.

Robert Boyle & Son, Ltd., 64, Holborn Viaduct, London; and 110, Bothwell St., Glasgow.

CATALOGUES, PRICE LISTS, &c., SENT POST FREE ON APPLICATION.

EAST GRINSTEAD.—For alterations and additions to Mr. C. M. Wilson's drapery business. Mr. Sidney A. Ell. A.R.I.B.A., East Grinstead, architect:—

Morris, J.	£2,397 0 0
Rice, C	1,769 17 0
Chitty, J.	1,569 0 0
Stevens, F.	1,239 0 0
Pledge, W.	1,157 0 0

GATESHEAD-ON-TYNE.—For the erection of schools at Whitehall, for the Gateshead School Board:—

Reed, N. and R.	£6,770 0 0
Lowrie, J. and W.	6,660 0 0
Ross, J.	6,485 0 0
Lamb, T. R.	6,398 0 0
Elliott, J.	6,250 0 0
Atkinson, H.	6,073 0 0
Harrison and Lowes,	6,063 0 0
Pringle, A.	5,832 0 0
Middlemiss Bros.	5,788 0 0
Haswell and Waugh	5,761 0 0
Hutchinson, T. H. (accepted)	5,693 0 0

ILMINSTER.—For the erection of house and offices and other buildings at Lambrook. Mr. G. B. Jewell, M.S.A., Yeovil, architect:—

Clatworthy and Shire (accepted).

KENNINGTON.—For rebuilding 46, Kennington-road. Messrs. Hudson and Booth, 17, Godliman-street, E.C., architects. Quantities by Mr. H. Lovegrove, 26, Budge-row, E.C.:—

Larter, W., and Son	£2,275 0 0
Greenwood, J.	2,183 0 0
Mortar, J.	2,115 0 0
Hall, Beddall, and Co.	2,100 0 0
Higgs, F. and H. F.	2,084 0 0
Spencer and Co.	2,080 0 0
Jerrard, S. J.	1,987 0 0

LEICESTER.—For St. Leonard's Vicarage, Leicester. Mr. J. C. Traylen, diocesan surveyor, Stamford, architect:—

	House.	Fencing.
Roberts Bros., Stamford	£1,198 0 0	£120 0 0
Halliday, S. F., Stamford	1,197 5 0	83 0 0
Bentley, S. and E.	1,158 0 0	73 0 0
Herbert, T. and H.	1,134 0 0	103 10 0
Jewsbury, J. O.	1,110 0 0	80 0 0
Clarke and Garrett	1,100 0 0	95 0 0
Bland, T., and Son	1,075 0 0	97 10 0
Elliott, N.	1,072 5 0	93 10 0
Hutchinson, T.	1,054 10 0	90 16 0
Bland, H.	1,040 0 0	85 0 0
Duxbury, G.*	990 0 0	79 0 0

Rest of Leicester.
* Accepted.

LONDON, E.C.—For the construction of the superstructure of the new fruit and vegetable market, and for alterations in the basement of the Central General Market, for the City Corporation. Mr. A. Peebles, architect:—

Rudd and Sons, Grantham (accepted) £41,973

LONDON.—For decorations, &c., at 14, Trebovir-road, Earl's-court, for the National Freehold Land Society:—

Cordell	£334 12 0
Bane Bros.	258 0 0
Young and Lonsdale, Herne Hill	237 0 0
Hamilton	235 16 6
Wyatt (accepted)	178 0 0

LONDON.—For alterations and additions to the Spanish Patriots Tavern, White Conduit-street, Islington, for Messrs F. J. Newport and Co. Mr. F. G. Grierson, 9, Old Jewry Chambers, E.C., architect:—

Hollingsworth, H. H.	£294 0 0
Goodall, S.	285 0 0
Courtney and Fairbairn	258 0 0
Olver and Richardson	253 0 0
Vollar, F., Wood Green	251 0 0

Pewterer's work:—
Davis and Son, Old Kent-road.
Gasfitter's work:—
Ungar and Co.

MORTLAKE, SURREY.—For the erection of a Conservative club, for the Mortlake Conservative Club Co., Ltd. Mr. T. Potter, Sevenoaks, architect:—

	A.	B.	Time.
Hill, J., Barnes—	£3,768 18 0	£195 10 0	6 Months.
Charteris, D., London—	2,937 0 0	160 0 0	7 ,,
Killby and Gayford, Finsbury—	2,867 0 0	157 0 0	5 ,,
Goddard and Sons, Farnham—	2,845 0 0	162 0 0	9 ,,
Hensler, G. W., Richmond—	2,835 0 0	179 0 0	—
Hughes, R. G., Mortlake—	2,822 0 0	175 0 0	—
Lansdown, Richmond—	2,820 0 0	169 0 0	—
Wallis and Sons, Maidstone—	2,794 0 0	148 0 0	6 ,,
Hunt, A., Barnes—	2,719 0 0	146 0 0	6 ,,
Toms, G., Camden Town*	2,719 0 0	128 0 0	4 ,,
Egan and Co., Mortlake—	2,705 0 0	130 0 0	6 ,,

* Accepted subject to deductions.
A.—Estimate for club and hall. B.—For gallery

LEOMINSTER.—For the restoration of the tower of the priory church. Mr. F. R. Kempson, of Hereford, architect:—

Millward, Leominster	£2,208 0 0
Edwards, Leominster*	1,470 0 0
Jones and Son, Sedgeley	1,400 0 0
Collins, T., Tewkesbury	1,368 0 0

* Accepted as reduced to £1,345 6s. 2d.

MARYLEBONE.—For the erection of new gateways, &c., at their dispensary, East-street, Marylebone, W., for the guardians of the poor of the Parish of St. Marylebone. Mr. H. S. Snell, F.R.I.B.A., London, architect:—

Wall Bros., Kentish Town	£429 0 0
Bamford, W., Pentonville	410 0 0
Lovden, W. H., and Son, Upper Tooting	379 0 0
Nye, T., Ealing	339 0 0
Godson, G., and Sons, Kilburn	313 0 0

NOTTINGHAM.—For proposed alterations and additions to Alfreton-road Board Schools, Nottingham, for the Nottingham School Board. Mr. A. H. Goodall, Nottingham, architect. Quantities by the architect:—

Wheatley and Maule	£625 0 0
Shaw, J.	593 0 0
Hutchinson, J.	590 0 0
Attenborrow, J.	589 0 0
Clarke, A. B.	580 0 0
Adams, J. J.	578 0 0
Emerson and Franks	570 15 0
Barlow and Whittaker	570 0 0
Hind, E.	564 0 0
Cuthbert, T.	560 0 0
Cooper, J.	551 10 0
Oscroft, J.	549 0 0
Evans, J.	546 0 0
Wartnaby, F. (accepted)	539 0 0

All of Nottingham.

PLYMPTON.—For residence at Plympton, near Plymouth, for Mr. T. Martin. Messrs. J. W. Rowell and Son, Newton Abbott, architects. Quantities supplied by the architects:—

May, T.	£4,777 0 0
Rundle Bros., Kingsbridge	4,689 0 0
Lapthorne and Goad	4,655 0 0
Pethick Bros.	4,644 0 0
Lethbridge, A. R., and Son	4,615 0 0
Pitwood and Hellings, Plympton	4,226 0 0
Blowey, P.	4,175 0 0
Trevena, W.	4,159 0 0
Kennedy, T.	4,094 5 6

Rest of Plymouth.

[As the amount of the lowest tender is in excess of the sum proposed to be expended, the architects will probably reduce the size of the house.]

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIX.—No. 1853.
FRIDAY, JULY 11, 1890.

THE DETERIORATION OF BUILDINGS.

ALL our great buildings in London, whatever their architectural merits or pretensions, have to pay the penalty of climatic conditions. Beautiful, bright, and attractive they may be for the first year or two after erection, then their features one by one disappear, the whole building becomes wrapped in a veil of gloomy greyness, till the architectural design is wholly lost to sight. The pall of soot and smoke obscures them so thoroughly that people pass by buildings of quite recent erection as if they were in their senility. Thousands of persons pass the Strand daily who look upon the Law Courts as an old begrimed building. Its outline and detail, which once attracted the eye by their piquancy, have become lost in that yearly thickening coat of carbon which covers the edifice. All the beauty of detail it once possessed has become invisible. Next to it the newly-erected bank, an ornamental addition to the architecture of Fleet-street, is also losing its pristine brightness and sharpness. In the City and Strand the same grimy veil has obliterated the design of many recent buildings which when newly built were pleasant to look at amidst the sombre surroundings. Even on the Embankment the same neutralising dulness has spread over the palatial edifices of stone and brick.

Anything which can be devised by skill to avert this doom of our architecture, anything which the chemist can do, or the manufacturer of new material supply, will, we are certain, be hailed with satisfaction by the public at large and the profession. In an architectural aspect it is a national calamity that our great public buildings should be so quickly destroyed by the very means we take to heat them. The foreigner who has visited Paris, or any of the great Continental capitals, is apt to form a very disparaging idea of our architecture, and to draw comparisons that are peculiarly "odious." Apart, however, from the opinions of foreigners on our architectural ability, the accidental circumstance of the gradual disfigurement of our edifices is very discouraging. We are tempted to extol architecture as one of the Fine Arts, which produces a permanent influence and power over the mind, and in this respect is entitled to rank before music, or even painting and sculpture. It is supposed to produce a lasting pleasure in the human mind; a noble or beautiful edifice is a durable form of expression likened by the poet to a "petrified religion" or to "frozen music." But how can these ideals be realised when our climate and smoke play such havoc with the most costly of our buildings, that in less than half a dozen years after erection they are almost lost to recognition and their finer features quite obliterated? We can imagine an architect whose taste and artistic creed waver, or are inclined to change, not very desirous for the permanence of his designs; and there are many architects who would gladly hide from public view, as well as their own, some of their earlier efforts which appear in their own eyes *passé*, if not atrocious. We believe the late Sir G. Gilbert Scott felt dissatisfied with many of his earlier churches. There are, indeed, very few of our eminent architects who could look complacently on what they had done twenty years ago. In this sense, therefore, the obliterating finger of time is welcome. But the public taste, which less slowly improves, can see beauties in buildings of any age, and amongst architects the qualities of buildings, other than their own work, do not deteriorate with time. All architects, whatever their inclinations, can fully appreciate the beauties of great Classical edifices like St. Paul's, the Bank of England, Somerset House; the Houses of Parliament, though erected early during the Gothic Revival, can be justly admired, so that the diffidence of some architects, their want of confidence in their earlier performances, is a mere personal attitude of modest men, and does not in the least diminish the absolute merit of great works.

The deteriorating agencies that destroy our architecture are chiefly those of the weather, especially moisture and rain, and that due to smoke. We can combat the former only by employing resisting materials, those of a non-porous quality, but the deteriorating agency of smoke appears to defy the resources of scientific methods. The "grits," the most durable of the sandstones as containing nearly all silica with only a very small quantity of carbonate of lime, are excellent stones to resist a smoke-laden atmosphere or the action of weak acids, but they are still liable to be discoloured and seriously affected. The less durable stones we can protect by various processes, or coat them with a thin film of silicate; but this protection, useful for a time to preserve the stone from disintegration, does not preserve the natural colour. The film of sooty particles still adheres and gets thicker till every delicate carving or chiselling is choked up or rendered quite invisible. Driving rain and persistent moisture charged with acids at length assert their influence over the coat of soot, which falls off in flakes, leaving exposed to fresh attacks of soot and moisture a rough surface of white stone. We see the effect of this in the mottled appearance of our great edifices in the City, St. Paul's Cathedral, the Bank, Mansion House, Royal Exchange, and all of Wren's City churches, built for the most part of Portland stone. Close observation of the blackened sides of these buildings reveals fur-like coatings peeling off in places, leaving white and exposed stone surfaces. A kind of thickening of this soot film takes place, choking up the carved ornament. One thing we observe in nearly all these buildings is the unequal distribution of the discolouration or blackening. Some portions appear quite clean and white, though streaked with soot; other portions entirely blackened, as if in deep shadow. We have noticed these effects in the exterior of St. Paul's, where the parapets and upper portions look blanched white, and the entablatures and faces below the sunken parts are quite black. Other examples of this partial discoloration may be found in most of the buildings of stone in the Strand, the river front of Somerset House, and Greenwich Hospital. The cause of this patchy and streaky appearance is due to the effect of wind, rain, and sun. The wind drives the dust and particles of soot against the building, and wherever there is a sheltered place, as under cornices, entablatures, pediments, capitals, and columns, where the sun has no direct influence, the black adheres, the mouldings and carvings are quickly filled up with the particles. When rain accompanies the wind the effect is still more apparent—the south and west sides are more exposed to these agencies. On the other hand, wherever the stone is exposed to the sun and wind there we find a blanched and clean appearance as in the parapets, and columns, dentils, and other prominent surfaces which catch the rays of the sun. On the opposite sides there is a black shadow of dirt. It is impossible to devise means to prevent this effect; the only preventing means is to purify the atmosphere, to reduce our coal fires, and to consume our smoke—unattainable objects under our present system. Wherever wind and rain and sunlight co-exist with a smoke-laden atmosphere, there we shall find this great source of disfigurement. The blackening to which we now refer is not only destructive to the stone, but from an architectural point of view deteriorative in another way. All relief, light and shade, projection and recess, become completely lost to sight. We no longer perceive the design, which appears obliterated or completely dulled; all shadow and lines of relief are lost, and the whole façade appears a darkened blank. Year by year we watch this painful disappearance of the features and details of our new stone buildings. One by one they seem to sink into a deepened shadow from which they never emerge; their bright lines, the carving of capital and frieze and panel sink into a dull black, the windows and columns and pilasters at last disappear from view, or assume one plane of dull flatness. Who, for example, can fail to observe the gradual losing of the points and features of interest in the Law Courts, the architectural detail of which is disappearing in the general blackness? Sir Arthur Blomfield's new Bank adjoining has put on a half-brown, smoky look, its features and bold towers sinking into obscurity. Col. Edis's offices on the opposite side of Fleet-street, and Mr. Gibson's bank—one of terracotta and the other of stone ashlar—have both lost their features, and will soon be reduced to a dead level of blackness. This neutralising effect of smoke is at work everywhere: the buildings on the Embankment, the City of London Schools, the block of buildings in the Temple Gardens, Sion College, and St. Stephen's Clubhouse, at the western end, are mere shadows of what they once were.

The effects of smoke on other materials than stone, brick, and terracotta are almost as discouraging, though perhaps in less marked a degree. The ordinary painted stucco front, perhaps, wears as well as any material; it gets a dirty and drabby colour if not repainted every three or four years, but the black does not cling to it with such tenacity. The rough stucco, rough-cast, especially in fronts in which this material has been scratched or decorated by patterns, as in a front in Fleet-street near Ludgate-circus, assumes a very dirty and anything but pleasing colour, the porous or rough surface of the material imbibing and retaining the smoky particles. Glazed stoneware has had its advocates; but we even find this very washable material becoming dimmed by the film of dust and soot, and scarcely regaining its freshness after a heavy rainfall. Certainly, however, the glazed and semi-glazed materials, and the smooth and vitrified skin of terracotta, as we see it used in the Albert Hall, the Constitutional Club, and the Natural History Museum, appear to retain for a lengthened time their freshness and colour, and acid fumes do not affect them. The general conclusion to be formed from the facts as presented is that a flat treatment of surface, without sinkings or depth of relief is less liable to deterioration. But the architect will be unwilling to forego his lights and shadows and ornamental features, and his alternative is to adopt a use of materials that can withstand the smoke for all prominent and decorative portions of buildings. How to do this is a problem that awaits solution.

COMPETITION DESIGNS FOR THE ENLARGEMENT OF KENSINGTON INFIRMARY.

SEVEN sets of designs for the enlargement of the infirmary of St. Mary Abbott's Workhouse, Kensington, are on view at the above union. We have space only here to describe the two principal designs in their general arrangements. Mr. T. W. Aldwinckle, F.R.I.B.A., has prepared a well-studied set of plans for the proposed additions, and we hear that the guardians, with the

assistance of the assessor, Mr. Thomas Worthington, F.R.I.B.A., of Manchester, have awarded the first premium to that gentleman's design marked A, and the second premium to that sent in by Mr. Delissa Joseph, of Basinghall-street. Mr. Aldwinckle's plans show a practical knowledge of the requirements of workhouse infirmaries. The administrative block is placed in the centre of site, well separated from the patients' department. The old block N is moved, as suggested by the committee, for this purpose. On the south side are three pavilions of sick-wards, these being situated with their axes at right angles to the south boundary, or in the direction of north and south, thus giving a free air space round each pavilion. The author rightly says to place them parallel to the south boundary would be to injuriously overshadow the new pavilions by the backs of houses of Lexham-gardens. The three pavilions give a total accommodation of 312; two of them may be erected without disturbing the existing iron building. The plans show each pavilion 72ft. apart, and containing a ground floor and three floors over. Each ward is 72ft. by 24ft., and contains 24 beds. There is also an isolation ward for four beds. Between the latter and the ward proper are a ward-scullery with windows overlooking both rooms, and a staircase with central lift for patients. At the sides of ward project a bath-room, lavatory, and three w.c.'s, a slop sink, and one w.c. for each isolation ward. These conveniences have intercepting lobbies. Each patient has 864c.ft. provided, or 72ft. super. of floor area and 6ft. of wall space. The isolation wards have 1,000c.ft. per bed, and the wards are 12ft. in height. The walls are specified to be finished in cement, with rounded corners. A polished pitch pine floor is provided for each ward. The wards will be lighted by Wenham or Meteor pendent gas-lamps, warmed by stoves and radiators, and have fresh-air inlets in connection with brick flues 14in. square on each side external wall, there being grated openings at ceiling level which will lead to a shaft with a Boyle's air-pump ventilator on the roof. The administration block is planned on the principle of a central zone. On the east side is the kitchen and offices; on the west side the general stores, to which access is obtained from main entrance—a desirable arrangement. The kitchen has a central open roof and skylight, and is opposite to, or on the same axis as, the general store. The residences of doctor and steward form the north and south sides of the block in front, with matron's and nurses' rooms arranged at the sides with bay windows. The lunatics will be provided for on the ground floor of the first pavilion, facing Marloes-road, the ward to contain 12 beds, a day-room, padded room, attendants' room, &c., are shown in connection. The escape bridges between the lavatories of the pavilions are useful adjuncts in case of fire.

Design B shows the wards planned to run east and west, parallel to the boundary—a less satisfactory arrangement. The elevations sent in are designed to harmonise with the existing brick buildings in a kind of Elizabethan style. The cost of the buildings (coloured red), including lighting and drainage for administrative block and 112 beds, is estimated at £16,750; the cost for the same and 312 beds is £30,450.

Mr. Delissa Joseph's design, awarded second premium, shows an ingenious arrangement of blocks. The pavilions are arranged at right angles to south boundary, and the administrative block is situated parallel to Marloes-road, on the west side of site, the steward's and medical officer's residences being at each end, but isolated from the official departments. The pavilions of wards are well separated, and are connected by corridors, with the required adjuncts. They are well placed for sunlight, and surrounded by sufficient air space. The details appear to be carefully studied, though the want of parallelism in the blocks may be objected to on architectural grounds.

Messrs. Pennington and Bridgen, Adelphi, show a fairly good plan. The administrative block, with kitchen and stores, are placed in the centre separated from ward blocks; on the north side is a pavilion running east and west, having on the ground floor a ward for 12 lunatics, 37 by 24, stores at each end, and nurses', bath, and padded rooms at the west end of block. This pavilion is connected by a corridor 10ft. wide with the administrative block. The patients' entrance is at west end of pavilion. On the south side of administration department is a long pavilion divided into three wards, one for 30 beds (90 by 24) at east end, a centre ward for 24 beds (74 by 24), and at west end a ward for 16 beds; with nurse, bath-room, and stairs between each. On the first floor, the lunatic pavilion has a ward for 28 beds, and a day-room at west end for four beds. A concrete flat over corridor connects it with the administrative block, where matron's and nurses' bedrooms, and operation-room are located. The south pavilion has wards for 30, 28, and 16 beds respectively. The third and fourth floors are similarly arranged. The elevations are proposed to be of brick, carrying out the style of the old buildings. The estimated cost is £15,500. Mr. Francis J. Smith, of Winchester House, Old Broad-street, shows two pavilions at right angles to south boundary, each for 24 beds, joined by a range of buildings parallel thereto; the isolation wards are between the pavilions. The plans are drawn to a small scale. Mr. William Bradford has a design having three pavilions running east and west, connected at the west end by a long block of administrative offices towards Marloes-road; a long corridor in the rear of block gives access to each pavilion. Mr. Henry W. Hunt has a plan showing a large administrative block connected by corridor to a long pavilion running east and west. Wards for 36 beds are provided at the east end, and wards for 26 beds at the west end, with isolation wards, &c., between. Messrs. Newman and Newman have a similar distribution or plan; the lunatic pavilion being a short block on the north side of the administrative block. Connecting corridors join the pavilions and official department.

NOTES ON BUILDING PRICES.—III.

By JOHN LEANING.

LABOUR.

ONE of the factors in the calculation of values is the cost of labour, of which, in its various phases, only long experience can judge wisely; but even the inexperienced may be certain that sanguine expectation of the result of a day's work will always be disappointed. It is generally admitted that men do much less work per day than they did thirty years ago, when their wages were much lower. Although the trades-unions may be congratulated upon much of their past work, which has notably improved the condition of the workman, their maxim "A fair day's work for a fair day's wage," like Talleyrand's "Point du zèle, monsieur," is, in the opinion of all but mechanics, a grave mistake. By it the capable and energetic workmen is reduced to the level of the comparatively lazy; but, nevertheless, the testimony from all good judges to the capability of the British workman is no mean tribute to his powers. The lowest rate of wages is that in the schedules of the Government departments, and as these are tendered upon at a discount of 10 per cent. and upwards, it may be inferred that the labour supplied at such prices cannot be of the highest quality, and when it is remembered that these rates cover establishment charges for which these schedules do not provide by any special clause, the uninitiated are lost in admiration of the ingenuity of the builder, who makes a profit under such inclement conditions. The truth is, however, that there are a number of men content to work at low wages (many of them worth no more) in consideration of the comparative permanence of the employment, and when the periodical contract for a district changes hands, they follow it to the new contractor. As a general rule, the building operative works 52½ hours in summer, and 47 in winter. In London wages are as follows:—

	Per hour.	Rate Commonly Allowed.
Excavator	0s. 6¼d.	0s. 7½d.
Labourer	0 5¾	0 7
Scaffolder	0 6¼	0 7½
Bricklayer	0 9	0 10½
(Do. when on gauged work 10d., difference seldom claimed or allowed in building accounts.)		
Mason	0 9	0 10½

Horse, cart, and man per day	9 0	9 0	8 0
Two horses, cart, and man do.	14 0	13 0	12 0

There are many men who work at lower rates than the foregoing; but this is a matter with which the surveyor cannot deal: he must adopt the current rates—the consideration is not important, for wages below the market rates always involve poor services. Employers pay workmen's fares when the work is four miles from the shop, or pay for lodgings. Workmen sent from London to the country at the request of employers receive London rates, with an additional allowance for lodgings; the railway fare is paid from London to the works, and, if the workman is discharged by the employer, back to London. Very good workmen are, in addition to the foregoing, paid 1s. per day "country allowance" as it is called. Engineers, like Maudslays, pay 2s. per day. In London overtime is paid for as follows:—For the first hour after usual time, 1d. extra; from the end of the first extra hour to 8 p.m. at the rate of 2d. extra per hour; after these hours, at the rate of time and a half. The extra time on Saturdays at the rate of time and a quarter up to five o'clock; and after that time at the rate of time and a half. In "tide work" six hours is usually paid for as nine hours, and if more than six hours is available in a similar proportion; the overtime rate applies to this time also. Working in water is paid at the rate of one-third more than ordinary pay, and the contractor finds water-boots. The War Office schedules provide as follows:—Whenever it may be necessary to employ workmen by the day between the hours of 6 p.m. and 12 p.m., or on Sundays between 6 a.m. and 6 p.m., one-half the contract rates per day will be allowed in addition for such work, and when employed between the hours of 12 p.m. and 6 a.m., or on Sundays between 6 p.m. and 6 a.m., double the contract rates per day will be allowed for such work. In like manner, whenever workmen are ordered to be employed on measured work at tide work, or during those hours of the night before specified or on Sundays, the extra rates for the labour only will be allowed in addition, provided in each case the contractor's claim is supported by a written order signed by the superintending officer, and the work is not specifically provided for in the schedule. In dealing with labour, whether in estimating or adjustment of accounts, the question arises as to the proportion of labourer's time to be allowed to each mechanic. Day accounts almost invariably demand the same

amount of time on a particular item of work for labourer and mechanic, and it requires much judgment and experience of working processes to deal justly with such claims. Observation of the progress of an average building will show a varying proportion at its successive stages; taking an average for the whole period, three labourers to five mechanics is a reasonably close approximation to the truth. The necessities of attendance are various; for works in which there is lifting and supporting, the labourer's constant presence is necessary. In others the labourer takes to the place sufficient material for the piece of work, and goes to it no more, except to remove the unused material. In building brickwork, when the scaffold can be supplied from the ground, one labourer can supply two bricklayers. As the height increases more labourers will be required; but one labourer can generally supply one bricklayer—the exceptions are rare. When men are doing gauged work, the progress is slow, and requires very little attendance. A mason fixing stonework will generally require a labourer in constant attendance, and when the stones are heavy two. The mason working at a banker only requires labourers' attendance for bringing the stone before working, and removing it afterwards. A slater generally requires constant attendance of a labourer, but often contents himself with a boy. The carpenter's work—roofs, floors, partitions, &c.—generally requires one labourer to three carpenters, and if the timbers are heavy, one labourer to two carpenters. One labourer will attend to two joiners as a rule; one labourer will serve two plasterers; one labourer will serve two plumbers, often a boy will do it. When considering charges for time in a day account, or in calculating prospective expenditure of time, observe that a workman often has to be specially brought from the contractor's yard to do a certain work, and that the time for his journey should, in justice, be allowed. Capable labourers are often set to pull down brickwork for an alteration by the bricklayer, and bricklayer's time charged for it. Labourers often limewhite and paint, and so save the time of more expensive men. Doubts are not seldom entertained by surveyors and others on charges for time, and their conclusions that it is overcharged are frequently correct; but mere moral certainty is not legal proof—it can only be a matter of opinion, and the *opinions* of experts have not such weight as might be desired. On any disputed point dependent upon opinion, evidence of equal force and diametrically opposed may be obtained if only trouble enough be taken to procure it. Contentions as to time are usually met by the builder's production of his books, of which the day accounts are or should be exact copies. The only test of a day account is comparison with the result of a measurement and valuation at current rates; but this is often fallacious. Many surveyors refuse altogether to criticise time charged in day accounts. They maintain that if absolute accuracy and proof is required, the work must be carefully observed by a clerk of works, or by the architect himself. The latter is, in most cases, impossible.

CONSTANTS OF LABOUR.

Constants are the most convenient form for the preservation and application of observation of the results of labour. When their importance is fully recognised we may hope to see an extended and complete series which will to a great extent supersede the current price-books. In the words of Gwilt, it is manifest that if the average time of executing each species of work were known, no difficulty could exist in fixing uniform rates of charge for it. In Gauthey's "Traité de la Construction des Ponts," 1809, there are constants in all trades. Rankine gives some of these in his manual of civil engineering, and Cresy in his "Encyclopædia of Engineering" translates them complete. They appear, so far as they go, to have been very carefully considered, but the changed circumstances of the artificers' work, the lapse of time, difference of nationality, and the inferior quality of the French workman (forcibly illustrated by Thomas Brassey's experience during his construction of French railways) detract considerably from their value, and they are, consequently, hardly worth the trouble of translation. Other French engineers, Geniey, Claudel, and others have pursued the study later, but only to a limited extent. Peter Nicholson, in his "Dictionary of Architecture," gives a series for the trades of carpenter and joiner, characterised by the care which most of his work evinces. Gwilt, in his "Encyclopædia of Architecture" repeats them, and adds a few in the Masons trade. Dobson, in his "Guide to Measuring and Valuing Artificers' Work," gives constants in all trades. Rankine gives a few in his "Useful Rules and Tables for Engineers." For Mr. Hurst, in his "Architectural Surveyors' Hand-Book," has been reserved the distinction of presenting a series in all trades, which are admitted (by everyone qualified to judge) to be by far the most valuable contribution of recent years to the literature of estimating. The careful thought and long experience which they embody will be apparent to all who may have occasion to use them. Dobson's constants are described as including profit, and he does not say what the rate of profit is—a return to the worst characteristic of the price-books, and an apparent failure to grasp their essential idea, the recording of cost. The mode of application of constants is so well known that a few words will be sufficient. A constant represents in days and decimal parts of a day, the time which a certain unit of work, as a yard, a foot, a rod, will require for its performance; the amount of the workman's wages for ten hours being multiplied by such constant, the result will be the cost of the unit as a yard, foot, or rod. An example of this is as follows:—

The wages for 10 hours' work being 6s. 8d. = ...	·333 of £
Constant for 1½ four-panel square door, including hanging	·077 of a day.
Decimal of £1.....	·025641 = 6d. per ft.

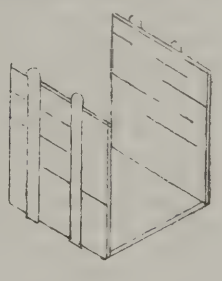
If it should be necessary to analyse a constant to discover quantity of work per day of ten hours, to which it is equivalent, the division of one day by the constant will produce that result. The following is an instance:—

	Days of a Navvy.
Excavating vegetable soil per cubic yard..	·045

·045)1·00(22 yards
90
100
90
10

The student of prices will find it instructive to collect all the constants of labour he can find, arranging them in a book in parallel columns, for comparison, thus:—

Excavate vegetable soil per cubic yard..	Rankine	Hurst	Dobson
	·05	·045	·088



It is also good practice to put any acquired information into constant form. Thus, three men excavate 45 cubic yards of clay of a certain character in ten hours:—

	Yds.	Day.	Constant.
45yds ÷ 3 men = 15yds per man	15)1·00	(·066	
	90		
	100		
	90		
	10		

The observation of one man's work is of little use in an inquiry of this kind. The industry and capability of men varies so much that constants must be based upon the average results of the labour of a number of men. The value of the older existing constants like Nicholson's, which are repeated in Gwilt's "Encyclopædia," are affected by the smaller quantity of work done in an hour by a man now than at the time they were produced.

ECONOMY OF LABOUR.

In a large work various labour-saving expedients may be adopted, which, in a smaller one, would be unreasonable. In such as these the advantages of competition lie with those contractors who are constantly engaged upon great works, with the requisite plant for the purpose. The use of overhead travellers, steam-engines, and cranes long enough to lift material from the cart or waggon and deliver it directly on the part of building where it is required, are obvious advantages. In London large cranes are now sometimes worked by hydraulic machinery connected with the main of the Hydraulic Power Company. In providing for these, it will be necessary to design the staging and its supports, charging it and the crane as use and waste. The hydraulic machinery may be hired from the Hydraulic Machinery Company, as in the next case of requiring use of crane, the site may not be near the line of hydraulic main, and may have to be worked by a steam-engine. A derrick crane, with 45ft. jib to lift 3 tons, with steam engine and boiler, weighs about 9 tons, and costs about £250. The fuel required, when in constant work, would be about 10 sacks of coke in 12 hours. A hand derrick crane of 20ft. radius and a jib 25ft. in length, to lift a ton, costs about £35; such as these are frequently used for suspending large stones in process of setting. As the staging for these is often fixed at a considerable height above the ground, timbers for the purpose of sufficient length in one piece are not obtainable; 9in. by 3in. deals; 11in. by 3in., or 11in. by 4in. planks, or flitches of timber bolted together and breaking joint are used instead. Outlay on basketing and wheeling of earth is saved by the use of iron buckets holding half-a-yard or a yard of earth, which can be hooked on to the crane raised and lowered into the cart in the street. Whether the bucket shall be tipped into the cart or carried to its destination for convenience of using a crane there, will depend upon circumstances, but generally the cart can be *tipped* at the end of its journey. Bricks also raised in a similar manner (by cranes) from the hold of a barge in wooden frames (as sketch) to fit a cart or van, each frame holding

about 280 bricks, may be carried three at a time by a two-horse van. They can then, without disturbance on their arrival, be hooked on to another crane and deposited close to the bricklayers. Bricks, when already deposited on the site, are rarely carried up ladders by labourers, some form of builder's hoist being generally adopted for all works, except the smallest; a block and fall or a rubbish-wheel and fall is often used for raising material. Worked stone is often packed in a flat, wooden tray at the builder's yard, laid on a truck which can be hooked on to the crane at the building and raised to its position. For the raising and conveyance of large stones from one part of a building to another overhead travellers can generally be economically used. In all these cases the fewer times the material is handled the greater the saving. But although the saving of labour in such cases is great, it is not so much as might be supposed, the expense of engines and cranes and their depreciation, and the conveyance to and from the building, erection and removal of machinery, staging, &c., is a considerable drawback. Moreover, the supports of travellers, gantries, &c., interfere with the straightforward progress of walls to an extent which architects will not always tolerate. For the comparison of machinery with manual labour see sections Mason and Carpenter. The exact apportionment of the cost of the work of steam-engines and machines to the particular items of work they contribute to produce, and so to find their share in prime cost is impossible; but a useful approximation may be arrived at. Probably the best way is to add a uniform percentage upon the remainder of the cost of every article on which machinery has been used, made up as follows:—

Per cent. per annum on the cost of engines and machines for interest on outlay	£	s.	d.
Do., for depreciation.....			
Total annual cost of fuel			
Total annual cost of water			
Total annual cost of engineer (for driving and repairs)			
Estimated annual rental of engine and boiler houses, and other buildings necessitated by machinery.....			

The comparison of an amount thus arrived at with a separate account of cost otherwise incurred upon all work for which machinery has been used, will show a proportion which may be

adopted for the calculation of a percentage to be added to every item according to its value. The calculation will be still more useful if a separate account be kept for each trade in which machinery is used. Machinery may be adapted by a skilful machinist to the production of a very astonishing variety of work, but cases have been known of enthusiastic manipulators who have spent so much time upon such modifications that in the end the work has cost more than twice as much as it would have done by common methods.

(To be continued.)

CONTEMPORARY BRITISH ARCHITECTS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

CONTINUING our gallery of portraits of practising British architects, we print to-day the sixteenth sheet. Mr. T. S. Robertson, of Dundee, is the President of the Institute of Architectural Science and Art in that town. He has been in practice for thirty years, and has carried out many works. We may enumerate among the more recent of his buildings St. Margaret's Church, Arbroath; St. Stephen's and Beach Churches, Broughty Ferry. Mr. Robertson was among the first to use malleable iron beams for commercial buildings in Dundee, and he has organised the annual exhibition of paintings there as joint Convener of the Hanging Committee. Other buildings of his which occur to be mentioned are:—Auchmithie parish church, the restoration of the 15th-century church of Foulis Easter, schools and hall at Morpeth, and Queen's Jubilee Memorial Arch at the Public Park at Broughty Ferry. Mr. Robertson's portrait is from the studio of Messrs. James Valentine and Sons, Dundee.

Mr. Henry Perkin, the President of the Leeds and Yorkshire Architectural Society for 1889-90, is the son of the late William Perkin, F.R.I.B.A., of Leeds, who had a large and varied practice in the county of York for upwards of 40 years, and with whom the subject of this notice was in partnership. Since 1877 Mr. George Bertram Bulmer has been the co adjutor of Henry Perkin, and they now practise under the name of Perkin and Bulmer. Amongst the works executed are the following:—The churches of Aldbrough, Hull; Allerton, Bywater; Barton-le-street, Hunslet Moor, Leeds; Woodlesford, and St. Cuthbert's, Leeds; the Mission Church at Whitwood Mere; a mission room, St. Mark's, Leeds, and another like work at Kirkstall. They restored Pool Church; the enlargement of St. Barnabas Church, Leeds, they did, and Clokaenog, North Wales. Among their school buildings are those at Altofts, Barlby, Arthington, Kippax, Bowers Row, Swilleigh; with more at Allerton, Pickhil, Thirsk; Tarwell, Peterborough; St. Cuthbert's Parochial Buildings, Leeds, were built from this firm's designs, and they enlarged St. Barnabas schools, besides building schools at Westerdale, Yorks; Sheriff Hutton, the Primrose Hill Board School, Leeds, those at Gledhow, Leeds, and Huggate Schools, also the schools at St. Simon's, Leeds. They designed vicarages for St. Peter's, Hunslet Moor, Leeds; Allerton, Bywater; Alltofts, Normanton, and Whitwood Mere. Their chief public buildings are the new Police Courts at South Shields, Pontefract Town Hall, Victoria Hall, Burley-in-Wharfedale, Leeds and County Bank, Pontefract; National Provincial Bank of England, Whitby; Yorkshire Penny Bank, Halifax; Penny Bank and Albany Hotel, Sheffield; the Constitutional Club, Burley-in-Wharfedale; among their residences are Colne Hall, Lancashire; Thornhurst, Headingley; Residence, Whitby; Hawkhills, Gledhow; Villas, Headingley and Garforth. Mr. Perkin is surveyor to two building societies. His portrait is by Mr. T. B. Nettleton, of Leeds.

Mr. E. W. Mountford, F.R.I.B.A., the architect for the New Sheffield Municipal Buildings, has, amongst other works, built a lecture hall and class-rooms at Wandsworth; Church of St. Paul and vicarage, Forest-hill; chapels and schools, Elm-road, Beckenham; Northcote-road, Battersea; and at Barnes; a mission hall and class-rooms at Earlsfield; St. Andrew's Church in the same place; a lecture hall and class-rooms at Cambridge; a hospital at Stratford-on-Avon, another at Whitchurch, Salop; at Stonelands, Sussex, he erected a house, entrance lodge, stables, and farm buildings; enlarged "Earlsfield," Wandsworth; and built houses at Shipston-on-Stour, Buxton; Earlsfield; others at Wandsworth, Guildford, East Plumstead, &c. His public library at Battersea was won in competition, and he has put up warehouses, &c., at Bow. He was first in a competition for a church at Woking, second for a hospital at Burnley, second for the Chelsea Library, and among the first six competitors for the Lincoln School of Art; Training College at Norwich, Cottage Hospital at Newbury, &c. Mr. Mountford was born in September, 1855, articled to Messrs. Habershon and Pite, of Bloomsbury-square, September, 1871; and then became clerk of works at St. Stephen's, Hounslow. He subsequently worked in the offices of Messrs. George Elkington and Son and Messrs. Giles and Gough. He commenced private practice October, 1880, was librarian at the A.A. 1887-8-9, elected A.R.I.B.A. in 1881, and F.R.I.B.A. in 1890. His portrait was done by Mr. J. A. Draycott, of Birmingham.

Mr. S. Flint Clarkson, F.R.I.B.A., was for four years (1872 to 1876) honorary secretary of the Architectural Association, was vice-president in 1876-77, and president during the session of 1879-80. He was brought up in the school of Sir Charles Barry, having been for a number of years with Mr. John Gibson, the architect of the National Provincial Bank of England, who received the Royal Gold Medal this year. Since 1867 he has carried on architectural practice from London in conjunction with his partner, Mr. John Clarkson, having also offices at Poplar and St. Alban's. Mr. Flint Clarkson is district surveyor under the Metropolitan Building Act for North Chelsea. He is a member of the Board of Examiners in Architecture. His portrait was taken for our series by Mr. J. Barnard, of St. Alban's.

Mr. Edward John Tarver, F.S.A., F.R.I.B.A., was educated at Eton College and Bruce Castle. He was articled to the late Mr. Benjamin Ferrey, F.S.A., March, 1858, took students' prizes at R.I.B.A. and A.A., 1861-2, was editor of the A.A. Sketch-Book at its starting in 1867, and President of the Architectural Association in 1874. He was the first paid lecturer at the A.A. on the "History of Architecture" for six years from 1881; he was one of the six selected architects out of forty-three candidates for the post of superintending architect to the Metropolitan Board of Work in 1887; he is certified competent to act as district surveyor, and has acted as an extra examiner at the R.I.B.A. associates' examination. He delineated Sandringham Church by command of H.R.H. the Crown Princess (the Empress Frederick) for reproduction at Potsdam in 1865; amongst buildings of various kinds, including churches, town and country mansions and other houses, schools, &c., he has carried out the following:—Church of All Souls', Harlesden (illustrated "B.N."), begun in 1878, completed Feb., 1890; parish church of St. Peter, Tyringham, memorial to the late Mr. W. B. Tyringham; Hooton Chapel, for Sir John Essington, Bart.; Willesden parish church, much enlarged; Mausoleum, Rossmore, for Lady Rossmore; repairs and additions to several old churches, many in Norfolk and Suffolk. The first house built by him, being handed over to him by his master, Mr. Ferrey, was Down Amney Parsonage, for the late Rev. Greville Phillimore, in 1863; Broadstairs Rectory, one of the earliest ventures in the modern style now generally adopted, in 1870; many buildings at Wadhurst Park, the seat of Mr. C. de Murrieta, including the mansion in 1872 (illustrated "B.N."), considerably enlarged in 1881, since which time he has carried out other works on the estate, one recently finished; also additions to, and rebuilding after the fire, No. 11, Kensington Palace Gardens, for Mr. de Murrieta's brother, the Marquis de Santurce; hunting-box at Ardennes, for the Duchess of Ossuna; alterations and additions at Parkfield, Hallow, for Mr. C. W. Lea, 1877 and 1886; additions at Colthurst, for the late Sir John Holker, attorney-general; has also been successful in curing obstinate down-draughts in St. Michael and All Angels' Church, Paddington; and has been employed in cases of party-walls, rights of light and air, &c. The photograph reproduced is by Mr. W. H. D. Pym, of Streatham.

Mr. Walter Green Penty, F.R.I.B.A., the President of the York Architectural Association, has designed and carried out several important buildings in York and neighbourhood. Of public buildings, his principal works are the York Institute of Art, Science, and Literature, the foundation-stone of which was laid by H.R.H. the Prince of Wales when visiting the Royal Agricultural Show at York in 1883, and the York Liberal Club, opened in 1888. He is the architect of several residences, amongst which may be mentioned "Burnholme," near York, and "Brooklands," Selby, Yorks. Several of the new blocks of business premises erected in the city of York during recent years are from his designs, and he has also been the architect of some large warehouses, flour-mills, and other buildings of a constructional character on the banks of the rivers Ouse and Foss; a flour-mill, silo-house, &c., which, when completed, will be probably the most complete in the United Kingdom, is now in progress from his designs. He has also built a number of homesteads in the North and East Ridings of Yorkshire. On the formation of the York Architectural Association in 1882 he was chosen the first president, and was again elected for a second period of two years in 1888. In 1883 he was elected on the City Council, but retired in the following year. He has also held the appointment of surveyor to the York Union Rural Sanitary Authority since 1876. He has taken a great interest in the York Architectural Association, and has also lectured on architectural and artistic subjects before the members of the York Institute of Art, Science, and Literature, and the York Arts Guild. His portrait is by Mr. W. Eskett, of York.

THE LATE SIR EDWIN CHADWICK.

FULL of years and honours, Sir Edwin Chadwick, K.C.B., the father of modern sanitary science, died on Saturday at his residence, Park Cottage, East Sheen, in his 91st year. Educated as a barrister, Edwin Chadwick early devoted himself to the study of the causes of zymotic diseases, and the means by which the losses of health and life resulting therefrom could be diminished. Chadwick then preached to a generation with ears that were deaf and eyes that were blind to the startling facts he brought before them; but though his views on cleanliness were rudely ridiculed, Jeremy Bentham left him a small legacy and part of his library. Earl Grey nominated Chadwick in 1833 as assistant commissioner to inquire into the operation of the Poor Laws of England and Wales, and the outcome of his searching investigations and elaborate report was the passing of the Poor Law Act. Mr. Chadwick was appointed secretary to the Poor Law Board, and during more than twenty years his labours in connection with it and the General Board of Health were untiring. Factory labour, half-time, and instruction occupied some of his attention. In 1338 he obtained a special commission of inquiry into the prevention of disease and the improvement of dwellings in England and Wales, and in 1843 one on interments in towns, which laid the foundation for subsequent legislation. In 1848, Mr. Chadwick was appointed a Commissioner of the General Board of Health, from which he retired nearly six years later on a well-deserved pension of £1,000. His services to the country were only tardily and grudgingly acknowledged. Created a C.B. in 1848, he was only a twelvemonth since advanced to the rank of knight in the same order. His labours have been indefatigable in all matters relating to the health and welfare of the people, and were continued to the last. His volume on "The Health of Nations," of which an abridged edition, revised by Dr. W. B. Richardson, has just been published, is a standard work on the subject of the benefits conferred on the people by attention to hygienic rules. Chadwick was an earnest worker in the Sanitary Institute from its formation, and was half-a-dozen years president of the newly-organised Association of Public Sanitary Inspectors, and his address to that body, read in his absence through enfeebled health, at the Annual Congress at Leamington in October last, was as fresh and vigorous in style as any of his earlier writings. His funeral took place on Wednesday at Mortlake Cemetery, and was largely attended.

A plan, prepared by Messrs. Morris and Hunter, Ayr, for the pedestal of the Ayr Burns statue, has been adopted by the Burns Committee. The pedestal is 12ft. high, and is to be of grey granite, with spaces for four bronze panels. On one side will be carved a thistle, and on the other sides flowers, or other devices, emblematic of England, Ireland, and the colonies.

CONTEMPORARY BRITISH ARCHITECTS.—DESIGNS FOR THE NEW MUNICIPAL BUILDINGS, SHEFFIELD.—TWO CROSIERS DESIGNED BY J. D. SEDDING.—MESSRS. HUDSON BROS.' NEW PREMISES, LUDGATE HILL.—SKETCHES FROM THE TIVOLI.—OLD ARMOUR AND FURNITURE FROM THE CASTLE OF NUREMBERG.

Our Illustrations.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 40.)

NEW MUNICIPAL BUILDINGS, SHEFFIELD.

Following up the views already given in our pages of three of the six final designs, and including the selected one, we print to-day two sheets of geometrical drawings which we select as being among the best in the competition. They represent Mr. F. H. Tulloch's design, already described by us last week. Illustrations of the three remaining designs will follow in due sequence.

TWO CROSIERS.

The episcopal staff of the Diocese of Bath and Wells, and that for the Bishop of Connecticut, are from the designs of Mr. J. D. Sedding. The basis of the crook in each case is of ivory, mounted with silver-gilt enrichments and figures, the ornaments being set in parts with jewels. The drawings given herewith show the arrangements adopted in each case, the illustrations being reproduced from the author's working cartoons.

NEW BUILDINGS, LUDGATE HILL, LONDON.

These buildings have just been erected for Messrs. Hudson Bros., provision merchants, as a central depot. The lower part of the front to Ludgate-hill is of grey and red granite supplied by Messrs. Whitehead and Sons, of Aberdeen, and the portion above the granite is faced with Bracknell red bricks and Mansfield stone dressings. There is a large basement with vault under pavement, the walls of which are lined with white glazed bricks. The first and second floors are to be let as chambers or offices, and the third floor will be occupied by Messrs. Hudson Bros. There will be communication between this floor and the ground floor by means of a private staircase. The building is being carried out by Mr. W. Shepherd, builder, of Bermondsey, from the designs and under the superintendence of Messrs. J. W. and R. F. Beaumont, architects, of 73, Queen Victoria-street, London, and No. 10, St. James's-square, Manchester. Mr. V. Hibbins is acting as clerk of works.

SKETCHES FROM THE "TIVOLI."

The "Tivoli" Theatre and Restaurant, which has just been opened to the public, is erected on the site of the old Tivoli in the Strand, and has cost upwards of £260,000 to build and decorate. The plans were originally made by Mr. W. Emden, and have been carried out by Mr. C. J. Phipps, F.S.A. The grand entrance is Indian, or, more strictly speaking, Moresque in character. The wall decoration consists of a series of arches springing from slender columns, the spaces between being filled with a close Oriental diaper in fibrous plaster. The colouring is three shades of blue, ivory, and gold; the dado is formed of hand-painted tiles, painted in shades of blue to match the general wall decoration. The principal dining-room, the Palm Room, is decorated in ivory and gold. The ceiling is formed of octogan panels, decorated with groups of palm-leaves, forming a pendant in the centre of each panel, from which drops an electric light in muffled glass. The walls were originally intended to have simply palm-leaf panels with silvered glass between, but a series of double-fluted pilasters have been added on each side of the palm panels, and the silvered glass reduced to one-third the intended size; this, of course, gives greater apparent height to the room. The dado is in alabaster and pavonazza marble, and the floor in marble slabs. This room will seat 100 persons. Above this apartment is the Flemish room, with high dado and ceiling of carved oak, the wall space being covered with tapestry panels; an open screen at one end divides the room. The floor is parquet. The staircase is French Renaissance in style, and is coloured in blue-grey and gold. There are also five private dining-rooms, the Louis XV. (the largest), the Pompeian, Japanese, Moorish, and the Masonic Room; these are all small apartments. The Louis XV. is in terracotta, pale grey and gold, with silk panels above the dado, divided by ornamented pilaster panels. The Japanese Room has also silk panels, but in strips of blue and brown, the dado, doors, and all the woodwork being in pitch and yellow pine, with painted subjects; these rooms have no fireplaces, but are heated by coil-cases. All the staircases and floors in the building are either concrete or stone. The builders are Messrs. Kirk and Randall. The decoration has been carried out by Messrs. Heighway and Depree and Messrs. Geo. Jackson and Sons. The whole of the interior decoration was designed by Mons. Chambon, of Brussels, and Mr. H. René Rainger, who personally superintended the work carried out by Messrs. Geo. Jackson and Sons. We published a drawing of the exterior, as also a view of the Palm Room, in the BUILDING NEWS for October 26, 1888; and on November 16, 1888, we illustrated the Flemish Rooms.

OLD ARMOUR AND FURNITURE FROM NUREMBERG CASTLE.

Among our illustrations this week is one of a group of furniture, arms, and armour from the historical collection which once found a home in the Royal Castle of Nuremberg. The piece of furniture seen to the right hand of our plate is an Early Nuremberg Wardrobe made of Hungarian ash and oak. The front is richly carved, and the construction accentuated by the three bold pilasters, the central one dividing the double doors. Shelves are fitted in the interior, and there are two drawers below. This piece is very rare, and stands about 6ft. 8in. high, is 4ft. 6in. wide, and 3ft. 4in. deep. The central cabinet of Nuremberg work is a well-proportioned and interesting piece; it is richly inlaid with marquetry of different woods in floral decoration. It would form a good model for modern cabinet work, for besides being elegant in its proportions and graceful in its outlines, it is thoroughly useful, for it has a goodly number of drawers and plentiful cupboard room, as also a commodious shelf. The other piece of furniture is a curious old Nuremberg Dresser of Hungarian ash, with scroll work of other woods in relief. It contains two doors in the body, with drawers under, and has a receding top ornamented with carved scrolls and fitted with drawers. These, with the two carved Chairs of usual German 16th-century design, are some of the more striking articles of furniture, of which there was not such a large collection as might have been expected. Coming to the arms and armour, which alone numbered some three hundred pieces, we show in our sketch three complete Suits of Armour, the earliest (that to the right) being a 16th-century tournament *cap à pie* suit, the helmet being furnished with visor, and having sharp-pointed top. The Suit to the left of central cabinet is also complete *cap à pie* armour, with goose-breasted cuirass, hinged finger gauntlets and shoulder wings. It comes from Augsburg, and is early 17th century. The figure in the left foreground is clad in 17th-century German cavalier armour. It is a fine suit, consisting of breast-plate, curious collar and shoulder blades, back and front, leg pieces with 16 hingings and winged helmet, the whole being studded with nails; the gauntlets have hinged fingerings. Arranged on the walls, or leaning against them, we have shown typical implements of war—some of them ugly customers indeed. Halberds, spears, javelins, battle-axes, and war-clubs, cross-bows, and swords, both single and double-handed. Amongst the latter is the ferocious Swiss two-handed sword, with curious guard, and whose blade has two double blood canals. This wide-reaching instrument is 6ft. 6in. long.

COMPETITIONS.

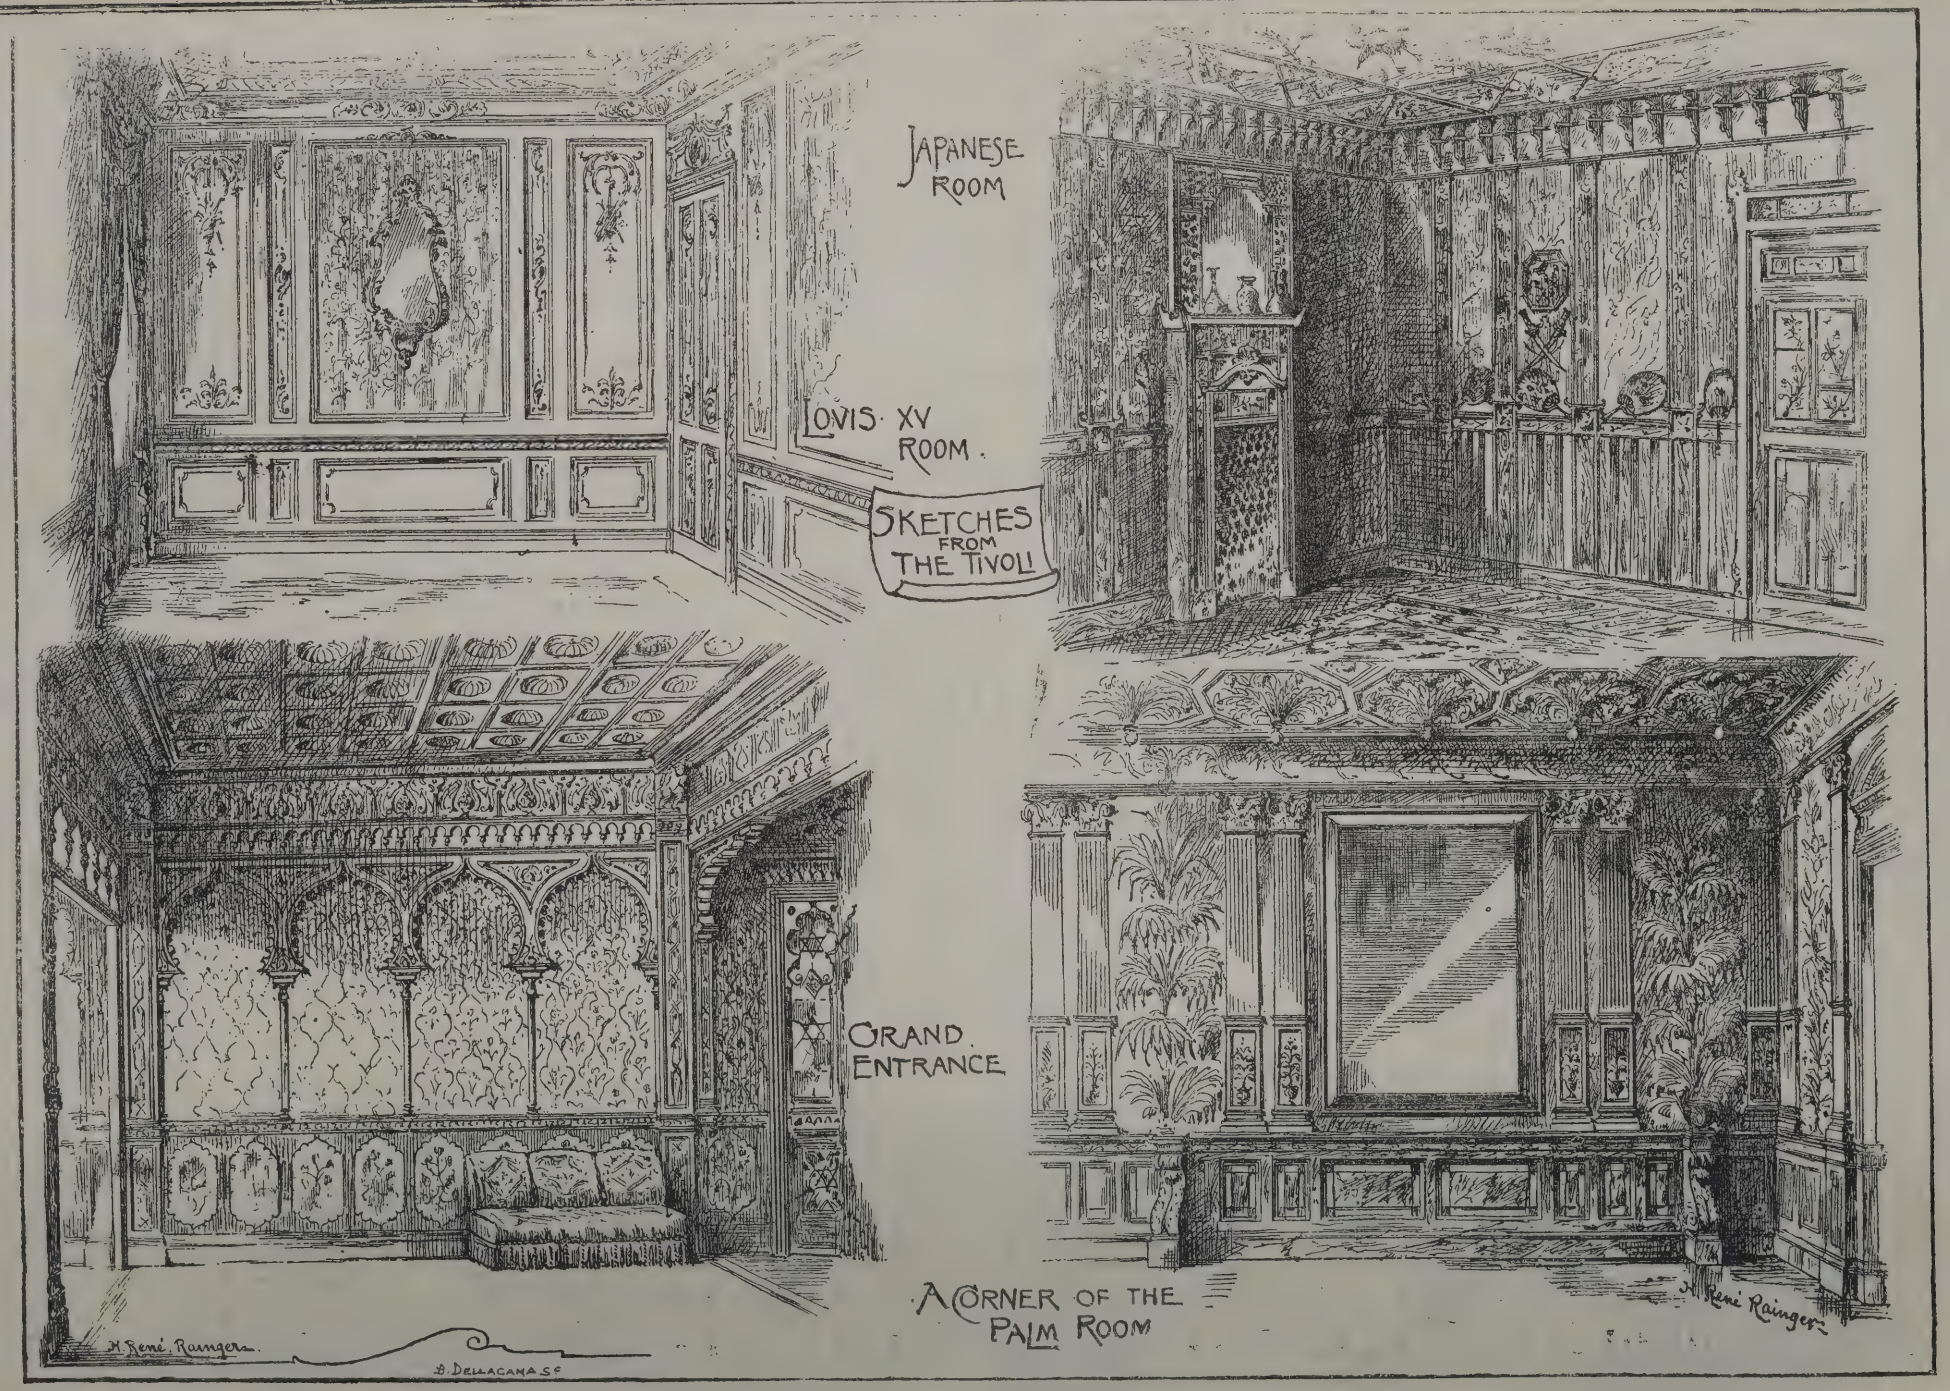
Ross.—In an open competition for the erection of ten almshouses and a common hall to be erected at Ross by Mr. T. Blake, of Ross, the design by Mr. G. H. Godsell, bearing the motto "£1,000," was awarded the first premium. The work will shortly be commenced.

Sheffield Municipal Buildings.—The particulars which we published on June 27 last, concerning Messrs. Flockton and Gibbs' claim, in consequence of the patent taken out by the firm for securing the right of reproducing the scheme of planning adopted in their original design for the Sheffield Municipal Offices, is attracting some attention in the profession. These architects have informed us this week that their patent will be completed in due course, when they will take care to publish the specification, so as to afford the profession and the public every opportunity to raise objections to the same.

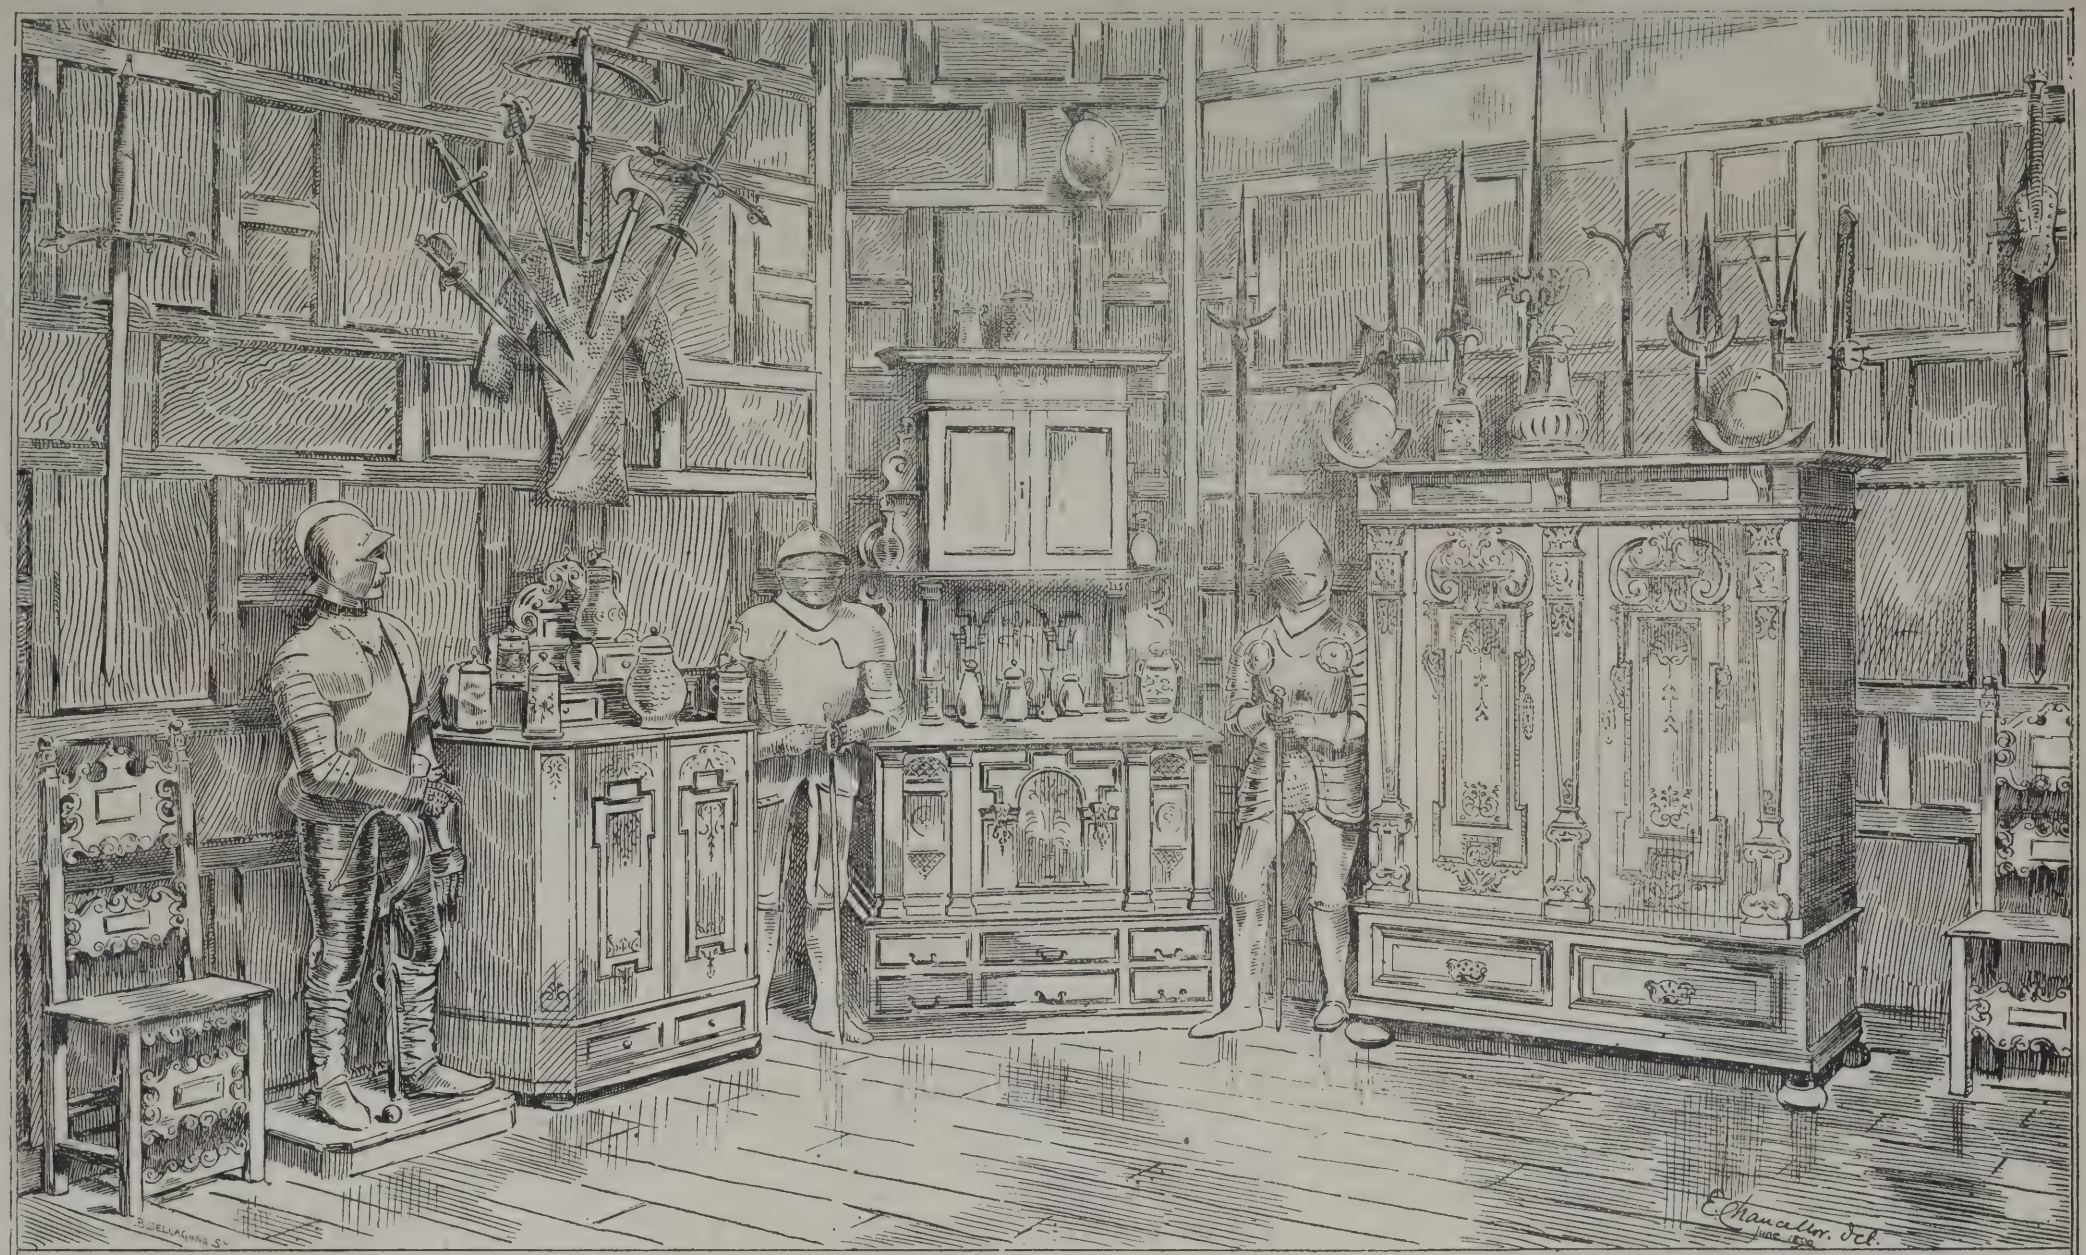
Wood Carving.—The second competition for carving and art woodwork, held by the Worshipful Company of Carpenters in their hall in London-wall, has just taken place, and it is satisfactory to learn that in the number of exhibits—but more particularly in the quality of the work shown—there was a marked improvement on that of last year. Money prizes to the amount of nearly £60 were awarded besides medals, and the company have every reason to hope that with these competitions and the school of wood carving they have established at Chapel-street, Bedford-row, a fresh impetus will be given to the art of wood-carving in this country. The next competition will be held in June, 1891, and the syllabus of same will be ready in the course of this month. The following were the successful exhibitors:—E. H. Atkins, silver medal for a chair; T. Jacob, bronze medal for a table; G. Mason, £3 for truss; A. Hooydonk, £2 for truss, special prize; W. Clayton, £5 for end of church seat; W. Metcalf, £3 for end of church seat; R. A. Brangan, £3 and bronze medal for bracket; Osmond, jun., £1 10s. for bracket; H. Cooper, £1 for bracket; J. A. Vogt, £4 and bronze medal for frieze; A. W. Yeomans, £2 for frieze; W. Clayton, £2 for frieze; J. Wilkie, £2 for back for hall chair; R. S. Barnes, £5 for fruit and flowers; J. Osmond, £3 for panels; J. Journaux, £2 for panels; J. Brudtuer, £2 for panels, special prize; J. Rowell, £1 10s. for panels; Edith M. Holt, £1 for panels; P. H. Peach, 10s.; C. Wilson, 15s. Those under 18 years of age:—H. Grimwood, £2; A. E. Halliday, £1.; C. Nott, 10s.

CHIPS.

A church to seat 250 persons is in course of erection at Beaufort, Mon. Messrs. Halliday and Anderson, of Cardiff and Llandaff, are the architects.



The new hospitals, Rochester, are warmed and ventilated by means of Shorland's patent Manchester stoves with ornamented tiled sides, supplied by Mr. E. H. Shorland, of Manchester.



The new Nunhead and Shortlands Railway has been commenced this week. A quantity of plant, &c., has been deposited on the ground near Nunhead Station in readiness for the works. By this short junction railway the London Chatham and Dover Railway Company will tap an increasing district at present badly served, and will provide an alternative route for main line trains to that through the long Sydenham and Penge tunnel.

Mr. G. F. Watts has just completed a new portrait of Lord Tennyson, uniform in size with the other portraits of eminent men belonging to the "Little Holland House Gallery."

Memorial stones of a Welsh Calvinistic Methodist chapel were laid at Cadoxton, near Barry, on Wednesday week. The chapel is being built from plans by Messrs. Seward and Thomas, of Cardiff, and will cost about £1,000. Mr. Griffith Jones is the contractor.

The Darcy monument in the Church of St. Botolph, Aldgate, has just been restored and set up afresh at the cost of the descendants of Lord Darcy. Messrs. Daymond, of Vauxhall Bridge-road, carried out the work.

OLD ARMOUR AND FURNITURE RECENTLY SOLD FROM THE CASTLE OF NUREMBERG

WAYSIDE NOTES.

SANITARY engineers and surveyors have to thank the late Sir Edwin Chadwick for their means of livelihood. In the days when the world was compassed about with much filth, when middens and open sewers festered in town and country, when the water supplies contained both victuals and drink, a "sanitary engineer" would have starved. At the present time there are a very large number of men who have grown fat—in a metaphorical sense, at least—on "sanitary work." Engineers proper do not find a chance for railway-constructing, canal-digging, or bridge-building to be a common occurrence in their lives at the far end of the nineteenth century, and architects proper (or improper?) have found the crumbs that fall from Mr. Buggins's table insufficient for their daily sustenance; but in the rummaging-about in dark basements for recalcitrant drain-pipes, the insertion of newly-invented siphons, traps, gullies, &c., the annihilation of the old race of pan-closets, and in the general remodelling of drainage arrangements, scope for ingenuity and means of employment have been found. This for the last-named individuals. The engineers have scored more heavily, and are, if anything, more deeply indebted to Sir Edwin Chadwick. They have found bolder work in the redraining of whole towns, and in the remodelling of city sewers. Young architects who never would have got hold of the right end of a practice by means of an ordinary architectural job have gained a measure of independence by virtue of the proficiency they have displayed in "sanitating" a house or two; and young engineers who, while evidently embryo Brunels and Stephensons, would never have risen above a resident engineership, have won some degree of renown by successfully competing for the sewering of Slowtown-in-the-Mud. It may be thought that I lack seriousness in these assertions; but I can say with the Apostle, that I speak of that which I know, and testify to the things I have seen.

Great, indeed, has been the advance in matters hygienic since the "Father of Sanitary Science" began to work and write. Nevertheless, the present condition of things is open to vast improvement. There are doubtless many ideas of Sir Edwin Chadwick that have never been worked out and practically applied. I cannot but think, for example, that it must have been offensive to the aged sanitator to see, and what is worse, to detect the presence of, by the nasal organ, the myriad of sewer ventilators—such common objects of the London streets. To a man always labouring on some scheme for benefiting the health of the community in general—and often of London in particular—it must frequently have become evident that something was wrong with a system that proved such a general nuisance in the heat of summer. The shortcomings of our London sewerage arrangements may escape the attention of eminent persons engaged in their amplification, and may not be observed by those who devote their time to sewage disposal; but they are evident enough at all times to those ordinary individuals who think at all of the health of London, and in hot weather they are made apparent to the most easy-going citizen. This defect or misapplication of ventilators to London sewers may have escaped the attention of the *father*, not only of sanitary science, but of professors of sanitation, and, if so, I can only hope that some day one of the numerous *sons* will take up the matter and induce authorities to look about for some method of reform. To so deal with the air of the sewers that it may not be discharged under our noses, and in its crude state, cannot be such a very difficult task for engineers in 1890. It would, indeed, appear to be one of those things that are neglected because they are so simple.

As for the manufacturers of sanitary wares, they have had a rare benefit out of the reforms of the last few years. Fortunes must have been made in drain-pipes alone. We can get no better idea of the development of sanitary science than that afforded by a consideration of the extent of the industries engaged in making glazed earthenware goods of one kind and another. They have grown to an enormous size, some of the largest business concerns being those principally engaged in turning the crude clay into the various pipes, &c., required in a complete and efficient drainage system on the most approved modern principles. Should it be proposed, as I doubt not it will be, to raise a monument in memory of Sir Edwin Chadwick, some of the large manufacturers ought to consider it their duty to come forward with liberal subscriptions. Their business has arisen from the rage for sanitation, and not a merely passing rage, but one that has a permanent hold on the world. Long may it so continue to do, and may the improvements effected be but a fragment of the whole benefits to come. And, above all, may the principles of sanitary science become more clear, its applications more simple, and may they be jealously guarded against self-seekers and faddists, who either complicate and involve or add superfluities and over-refine!

I foresee an increase in the smoke nuisance. From a certain date last week, I believe the "reforms" comprised in the abolition of some old dues that afforded a substantial relief to the rates in London, and hurt no one, came into operation. In consequence, I understand, the import of coal into the Metropolis has at once vastly increased. Coal is cheaper, and will be in the future, so far as concerns the London buyer. The result of cheapening any article of commerce is generally *waste*. Waste of coal means so much more smoke—and this is the pleasant reflection before us in view of next winter.

The County Council have shortly to elect a new chairman—for what reason is not very apparent. At the weekly meeting, on Tuesday, Lord Rosebery stated that he proposed to send in his resignation some time this week or next—his resignation will be declared the week after, and at the last meeting before the summer recess the election would take place. I presume Lord Rosebery can stand for re-election; anyhow, the Council will not get a better chairman. I may be wrong; but it seems to me that often the Council would have gone sadly astray but for the staying power and moderation of its chairman. I doubt whether the Council would have acceded to the recommendation of the Improvements Committee that it "be instructed at the next meeting of the Council to bring up details of the schemes for improvement to which we refer"—various improvements proposed by the Committee—unless Lord Rosebery had emphatically given it as his opinion that in the proposed improvement "betterment" did not play either a large or a prominent part. As a consequence, the Council agreed to the recommendation, and we are happily, it is to be hoped, spared an extraordinary and ridiculous performance. This would have consisted in the Council's "blocking" or laying aside every proposed Metropolitan improvement until Parliament have recognised the principle of betterment, and its enforcement in every proposed future improvement! Many will smile at the idea of such a thing; but it does appear from the words in the report of the Improvements Committee that this was nearly coming to pass. A farce it would have been, in every rational person's estimation, and none need be so glad that the recommendation of the Improvements Committee was agreed to as the Councillors themselves. They will be well-advised in letting the betterment business drop for a bit. There has already been sufficient expression of opinion to show that the betterment principle is generally unpopular—at any rate with regard to the Strand Improvements Bill, and to go in the face of this opinion, and the opinion of Parliament, will be a piece of folly which we would not accredit to the Council. The business, I take it, is to improve London for the citizens of London, and not to say, in a high-handed, dictatorial manner, that unless the improvements are carried out on a certain principle they shall not be carried out at all.

In pulling down old parts of London for improvements, either public or private, many poor people are unhoused, and there is considerable anxiety evidenced in Parliament and elsewhere, at different times, that new accommodation should be provided in lieu of the old buildings pulled down. This thoughtfulness for the poor, who cannot help themselves in these matters, is to be commended, for there are cases where disturbances to make room for improvements in crowded sites may cause the greatest trouble. It may be necessary for a labouring man to be up so early in the morning that he must reside as close as possible to his place of business, and there may be other reasons for a man's having to live in a certain place. Apart from these considerations, it is a question whether the principles concerned warrant the replacing of the homes in or near their old positions. It is now possible for a labouring man, in consideration of a quarter of an hour's wage, to go and return daily from the heart of London to "country suburbs," where his family will be brought up healthy and happily, instead of in the misery and squalor of a city slum, and where, when his day's work is done, he will have sources of recreation other than that afforded by the neighbouring public-house. It appears to me that the facilities offered by the nominal fares charged for working-men's tickets into the suburbs are not sufficiently regarded by persons who interest themselves in the matter of new dwellings, and that, in the development of the system of cheap railway travelling, many of the identical difficulties attendant upon city improvements will find an easy and happy solution.

Goth.

NEW HOSPITAL WINGS AT JAMES MURRAY'S ROYAL ASYLUM, PERTH.

WE have received "A Description of the New Hospital Wings" to this asylum, by Dr. A. R. Urquhart and Mr. A. Heiton, F.R.I.B.A. The authors describe the old asylum, opened 62 years ago, and arranged as two parallel blocks connected by a central administrative building. The south block contains six wards, three to each sex, and is of three floors. The lowest of them was used for excited patients; but the day rooms were required for stores, and it was found adapted for sleeping accommodation only. On the principal floor above are the wards for chronic patients, over which are the wards for convalescents. The plan appended shows how these galleries have been altered from the central corridor arrangement. Referring to the north block, the authors point out the additional accommodation made for the sick and infirm patients by the new wings. The number of patients resident in the asylum may be thus increased from 95 to 126, ample space being found for nurses, attendants, stores, &c. As the Classical style of the original plan was found necessary to be adhered to, the arrangement shown in the plan suggested itself, and appears to meet the requirements in a very ingenious manner. The wings extend east and west from the north or main block, thus forming right-angle projections. The intermediate gallery forms a useful separation between the old and new buildings, and is intended for the treatment of acute excited cases. The doors and windows are arranged to minimise noise and disturbance to other patients, and a resisting patient can quickly be restrained by attendants from both sides of the gallery. A bay window which can be curtained off, a fireplace and closet, and an airing terrace on the same level are provided. Another gallery running N. and S. is connected at right angles opening into single rooms. This gallery also has its lavatory, cloak-room, and porch, a bay window and fireplace for infirm patients. The single rooms are arranged so that two communicate, and may be used as two bedrooms, or as parlour and bedroom. The gallery or corridor leads directly to a large day-room and dormitory, forming a return block to each wing, with lavatories in connection. A service-room, with a projecting window overlooking day-room and dormitory, enables the attendants to serve the meals while overlooking the patients in the large rooms. The heating is by steam, delivered from the boilers at a pressure of 20lb., reduced to 5lb. on the square inch. The steam is distributed by 2in. cast-iron pipes behind the skirting of the outer walls, which are easily got at. The ventilation is also said to be satisfactory. Each room and corridor has its independent supply of fresh air and exhaust. A concrete channel is made between two joists for cold air, lined with cement, one end communicating with the open air by a valved grating, and the other end with a grating in the skirting. From the ceiling of each room or corridor a 12in. square zinc pipe is led to the ridge with an exhaust ventilator on the top, and the draught is assisted by the gas-pendant or the hot-water cisterns. Over the door of each room is also a ventilator that can be opened when the outer air is too cold. Dr. Findley's observations on the heating and ventilation of the asylum show that the results of this natural system are satisfactory. Details of the warming and ventilating arrangements are

given. To obtain the full benefit of the sunshine, the windows are made as large as possible, and the proportion of window to wall-space in the principal rooms is 1 to 10. The sashes have a deep bottom rail, and the soffit splayed upwards and inwards, so that a current of air can be admitted at the sash check. In the principal rooms the windows are carried up in pediments to the ceiling level, and this upper light is of small, tinted panes, hung to fall inwards at the bottom to any desirable inclination. As regards fittings and details, the wall-spaces are lined with moulded pitch-pine, 6ft. high; the upper portion of wall in day-rooms is finished in panels, with Keene's cement mouldings, filled in with Japanese leather paper; the ceilings are coved and panelled in ornamental squares. Fireplaces (Barnard, Bishop, and Co.'s) are fitted in the rooms and corridors. The window recesses in the dormitories are filled with low cupboards of mahogany, and surrounded by ferneries and aquaria, and in the day-rooms have cushioned seats.

ARCHITECTS' JOINERY.

WE have received Part II. of Mr. F. A. Fawkes' work on "Architects' Joinery and its Ornament," published by Mr. B. T. Batsford, which is an illustrated price list of various mouldings, plain and enriched ornamental pine chimneypieces and overmantels, and dado panelling. Plate 30 gives a number of full-size sections of plain dado and picture rails of good profile, and photographs of the mouldings, giving an excellent idea of their actual appearance, follow in another plate. Many of them are very effective. Plain skirtings follow, showing examples from 9in. to 14½in. deep, ranging from 32s. to 48s. at per 100ft. run. The enriched mouldings for dado rails show dentil, fluted, Vitruvian scroll, egg-and-tongue and Greek fret, Roman and Italian ornament enrichments. These are also illustrated by photographed examples. The mantelpieces are various, and four plates are devoted to them. The designs include the very plainest description suitable for small sitting-rooms, bedrooms, and those for high-class residences range in price from £2 2s. to £12 10s., including overmantels. Dado panelling is also illustrated, and prices given. Mr. Fawkes' joinery is manufactured at Chelmsford, and we recommend this supplementary and illustrated list to the profession.

UNDERPINNING OPERATIONS IN EUSTON-ROAD.

THE alterations incident to town buildings frequently necessitate underpinning—an operation which requires close personal supervision and much ingenuity. At the corner of King's Cross and Euston-road two old houses are in process of conversion into a new restaurant for Messrs. Reggiori Brothers, the plans for which have been prepared by Mr. Robert Willey, F.R.I.B.A., of Ludgate Chambers, and the work is being carried out by Mr. Howell J. Williams, builder, of St. Andrew's-hill, E.C. On the ground-floor the plans propose a grand saloon, extending from Euston road, 88ft. in depth, to King's Cross theatre, and 16ft. in width to a distance from the footway to the front wall of the old houses. Beyond this the width is increased to the full extent of the two houses, the latter of which abuts on Liverpool-street. In both this street and Euston-road shop-fronts are required. Under the first house it was necessary to remove three of the four walls, the fourth wall being the party-wall dividing No. 3 from the adjoining house on the west side. The upper part of these houses required to be carefully supported by needles and uprights, and in the side abutting on the theatre as well as at the side party-wall, underpinning had to be resorted to so as to make the basement below the saloon 6ft. in height. The walls thus removed are supported beneath the first floor by three wrought-iron girders, two cross girders of 16ft. bearing carrying the front and back walls of No. 3, and a long girder supporting the party-wall on the east side. Thus three of the supporting walls have been removed; short needles were introduced under the chimney jambs of the party-wall and the front and back walls at intervals, supported by dead shores. The walls below have been so successfully removed that not a crack is visible in the old walls and ceilings above. The east party-wall thus underpinned is 18in. thick below and 14in. above the first floor, and the girder carrying it are supported at the ends by cast-iron ribbed stanchions, and by two intermediate iron columns resting on brick piers in cement brought up from the basement. The shorter girders carrying the front and back of the house also rest on similar stanchions built into the walls. The underpinning of the party-wall on the west side, also that of the theatre in the rear, has been undertaken in short lengths, about 3ft. at a time, and the new work rests on a bed of cement concrete 2ft. 9in. in depth. The theatre wall, which is not very sound in the bond, has been underpinned to a depth of 9ft. We congratulate Mr. H. J. Williams, the contractor, on the success attending the operations, which were of an unusually skilful character. The whole of two houses, three stories in height above the first floor, have thus been underpinned on every side, and the old walls below completely removed, their weight being transferred to girders and columns. The work is the more satisfactory from the fact that it has been accomplished without the slightest settlement, and under the vigilance of surveyors acting for the adjoining properties. The work has been carefully superintended by P. Renouf, the foreman, and under the supervision of Mr. W. Chapman, clerk of works, acting for the architect.

CHIPS.

The Marquis of Ripon formally inaugurated on Monday a free public library which has been established at Barnsley through the munificence of Mr. Charles Harvey, of Park House, Ardsley. The circumstances under which the gift has been made are peculiar. In the year 1877 the Public Hall was opened, the erection of the structure having been carried out by the Barnsley Public Hall and Mechanics' Institute Company, Limited. The company was floated with a capital of £16,000, but from the beginning it found itself in difficulties, and the property had to be mortgaged to the extent of £11,000. When it became impossible to pay the 2 per cent. interest, Mr. Harvey, who held the mortgage, offered to give it to the town for a free library, and £600 has been spent, under the direction of Mr. J. H. Taylor, the borough surveyor, in adapting the building to its new purposes.

Mr. A. W. Bean, J.P., died on Tuesday week at Danson Park, Welling, Kent, where he had resided for over a quarter of a century. He was a partner in the firm of Messrs. Jackson and Bean, contractors, a firm formerly well known throughout the country. Mr. Bean was in the 66th year of his age.

The Prince and Princess of Wales opened, on Monday, Vauxhall Park, which has an area of about eight acres, and has cost upwards of £43,000.

The Victoria Hospital at Folkestone was opened by the Duke of Edinburgh on Thursday, the 3rd inst. It has been built at a cost of £7,000 on a site adjoining Radnor Park, and contains 35 beds. Mr. Joseph Gardner, of Folkestone, is the architect.

The town council of Oswestry have appointed Mr. Thomas Lockwood, of Chester, architectural assessor in the forthcoming competition for new municipal buildings, at a fee of £30. The Duke of Norfolk, who owns, among his numerous inferior titles, that of Baron Oswaldestre, has offered a donation of £50 towards the cost of the buildings, with a letter expressing a hope that whatever style is chosen, it will be "a thoroughly English one."

Last week it was stated that the architects for the new tower, Clifton College, were Messrs. Dunn and Hansom. We are requested to state that the architects were Messrs. Hansom and Bond, of Bristol.

New paper-mills have been erected at Wookey, near Wells, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by Messrs. Robert Boyle and Son's latest improved patent self-acting air pump ventilators.

A new post-office was opened at Totnes last week. It is built of brickwork with Bath stone dressings, from plans by Messrs. Heywood and Wooster, of Bath. Messrs. Brock and Ash, of Totnes, were the contractors.

The foundation stone of the new church of St. Jude, at Shieldfield, Newcastle-on-Tyne, was laid on Friday. Mr. A. B. Plummer, of Newcastle, is the architect.

A mission church to accommodate 150 adults has just been opened by the Lord Bishop of Llandaff at Cymmer, Glamorgan. Messrs. Halliday and Anderson, of Cardiff and Llandaff, were the architects.

Building Intelligence.

CARDIFF. — The foundation-stone of the Welsh Church of St. David in Howard Gardens was laid by Lord Tredegar on Wednesday week. The church is Perpendicular in style, and when completed will accommodate 500 worshippers. It will consist of a chancel 38ft. 6in. by 22ft. 3in.; nave, 67ft. by 24ft. 3in.; and north and south aisles 67ft. by 11ft. 6in., divided from the nave by a moulded arcade carried on octagon shafts, with moulded caps and bases. These arches are to be surmounted by a clerestory, pierced with two-light windows with foliated heads, the aisles being lighted with traceried windows of different designs. The roof of the chancel will be barrel-shaped, and boarded underneath the timbers. This roof is to be constructed of unpolished pitch-pine and divided into three bays, with moulded arched ribs, and sub-divided into panels with transverse moulded ribs, a carved patera being placed at each intersection. The roofs over the nave and aisles will be similar, but will be divided into five bays, with hammerbeam principals filled in with tracery. The seating and choir-stalls will be executed in unpolished oak. The passages in the nave and aisles will be paved with encaustic tiles, and the church will be heated with a small-tube high-pressure apparatus. Outside, the walls are to be faced with grey Maesycymmer stone in thin courses, and the dressings of the windows and doors are of Box Ground stone. The roofs are to be covered with green slates. The tower, measuring 13ft. 6in. at the base, and rising with spire to a height of 100ft., will be situated at the north-east angle. The estimated cost of the complete church is £5,500. The first contract is let to Messrs. Shepton and Sons, of Cardiff, for £4,179. Mr. E. M. Bruce-Vaughan, of Cardiff, is the architect.

MIDDLESBRO' SCHOOL BOARD. — On Monday last, the foundation stone of the Grange-road Schools was laid. The buildings, which will cost upwards of £20,000 including the site, stand upon a rectangular plot of ground, having frontages to Albert, Grange, and Dunning roads. Accommodation is provided for 1,228 children. A department for the teaching of cookery is part of the scheme; there is also a caretaker's house. In connection with each department there are covered play-sheds, and private rooms for the teachers. The buildings, which will be fireproof throughout, are of brick with pressed brick facings and red stone dressings from the quarries at Corncockle, in Dumfriesshire. The style adopted is a free treatment of the Renaissance. The ventilation will be by fresh warm-air inlets and exhaust air-pump ventilators. Open fireplaces are provided for auxiliary heating. The grates and mantelpieces are supplied by the Burmantofts Works, Leeds. The architect for the buildings is Mr. J. Mitchell Bottomley, 18, Albert-road, Middlesboro'-on-Tees, whose design was selected in competition under the adjudication of Mr. E. R. Robson, the architect to the Education Department. The clerk of the works is Mr. T. Todd, and the contractor for the whole of the works is Mr. Joseph Lord, of Middlesbro'.

NEWCASTLE-ON-TYNE. — The foundation-stone of St. Augustine's church, Brighton-grove, was laid last week. The church is being built from designs by Messrs. Johnson and Gibson, architects, by Messrs. N. and J. Reed, builders, Corporation-street. The edifice is designed in a simple type of Pointed architecture, and will be constructed entirely of stone. When completed it will consist of a chancel 35ft. by 25ft., with morning chapel on the south side and vestries on the north; a nave 85ft. by 29ft. having north and south aisles of the same length, and each about 12ft. wide. The nave is separated from its aisles by six arches on each side, and there will be a high clerestory of triple lancets, with a similar window at the west end, high up in the gables. The east window is also to be a triplet. There will be a high chancel screen under the arch, and the altar, with its reredos, will stand on a platform elevated by eleven steps above the floor of the nave. The roofs of both nave and chancel will be panelled internally with wood. The nave will be 44ft. high internally, and the chancel 35ft., and the external height of the ridge will average rather more than 60ft. above the ground. Only five bays of the nave are contracted for at present. When finished, the church will hold 900 people.

SOUTH SHIELDS.—The new Post Office at

South Shields was formally opened on Monday. It has been erected on the site of Kepple House, with frontages of 70ft. to Russell-street, and 90ft. to Smithy-street. The style is Queen Anne, executed in terracotta and red brick facings. The terracotta has been supplied by Messrs. J. C. Edwards and Co., of Ruabon, Wales, and the red facing bricks are from Grosmont, near Whitby. The main building has four floors. In the basement there are rooms for letter-carriers, clerks, and linemen. The public office is on the ground floor, with a porch in Russell-street, and is 38ft. by 20ft. On the same floor is the sorting office, 62ft. by 28½ft., and 15ft. in height, with open roof. The instrument room, over the public office, is reached by a stone stairway, and measures 38ft. by 21ft. The building is fire-proof, the floors being carried by strong rolled-iron joisting and cement concrete arching, on which are laid the tile and wood floors. The sorting office floor is of concrete, with pitch-pine block flooring laid on the same. The walls to the basement are built with a cavity, filled with White's hygeian rock, to secure perfect dryness. The contract for the building has been carried out by Mr. Joseph Elliott, of North Shields, from the designs of Mr. Henry Tanner, of her Majesty's Office of Works, London, and under the supervision of Mr. T. Searchfield, of London. The fittings have been supplied by Messrs. R. Goodwin and Son, of South Shields.

WOLSINGHAM.—A new convent and boarding-school, dedicated to St. Anne, was inaugurated on Monday by Pontifical High Mass at the church of St. Thomas of Canterbury, Wolsingham, adjoining the new building. The buildings are erected upon a site of two acres. At either side of the main entrance are large reception and sitting-rooms; there are also day-rooms for boarders and day-scholars, dormitories, chapel, school and class-rooms, lavatories, and baths. The school-room is 48 by 22ft., the class-room 28 by 15ft., the principal dormitory 55 by 30ft., and the Infirmary 20 by 18ft. The building is surrounded by gardens, grounds, tennis-courts. The convent has been planned by the pastor, the Rev. Father Taylor Smith. The contractors for the work were Mr. J. Hopper, Wolsingham, builder; Messrs. Dobinson Brothers, Wolsingham, joiners; whilst Mr. F. Taylor, of Stanhope, and Mr. W. Wray, of Tow Law, executed the painting, plumbing, gasfitting, and glazing; and Mr. R. Collie, Newcastle, the electric bells and speaking tubes. The sanitary arrangements have been constructed under the inspectorship of Mr. W. M. Egglestone, of the Sanitary Authority of Stanhope.

Messrs. A. Lethbridge and Son, of Plymouth, have taken the contract for building, at the Foundry-ope, King-street West, a model lodging house, which Dr. Alfred Hingston is about to erect, at a cost of £2,200. The model lodging-house is intended for the reception of tramps, and will be four stories in height. It is to be built of red brick, with stone and cement dressings; the ground floor will contain a huge kitchen for cooking food for the inmates, and the interior will be fitted up with baths, lavatories, and sleeping accommodation.

The trustees of the Northern Technical and Recreative Institute have completed the purchase of a valuable freehold site of upwards of an acre and a half area, with a frontage of 130ft. to the Holloway-road, whereon to erect the buildings required for the purposes of the institute. The buildings are proposed to include a large central hall, available for lectures, concerts, industrial and art exhibitions, class rooms for various studies, workshops for technical teaching, and a gymnasium.

An extensive fire occurred on the premises of Messrs. Grimwood and Sons, builders and contractors, at Sudbury, Suffolk, on Wednesday week, originating in the engine-house. The flames spread so rapidly that forty workmen had to run for their lives. The premises and workshops were destroyed, the workmen losing their tools, neighbouring cottages were greatly damaged, and families rendered homeless. The damage is estimated at £15,000.

On Thursday the Blyth Dry Dock Company opened their No. 2 graving dock in the Tyne. The new dock is constructed to a temporary length of 285ft., but will be extended to 370ft. at an early date. It is 47ft. wide, with a depth of water on the sill of 18ft. at ordinary spring tides. The work of construction has been carried out by the company's officials, under the superintendence of Mr. J. Watt Sandemann, C.E., of Newcastle.

Mr. W. F. Tollit, of Totnes, has been elected borough surveyor by the corporation of that town, in the place of Mr. S. Cuming, resigned.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION.—The 47th annual congress of this society is being held this week at Oxford. The opening meeting took place on Monday, the Earl of Winchilsea and Nottingham presiding. The mayor offered, in the name of the city and University, a hearty welcome to the members and visitors of the congress. The party, led by Mr. E. G. Bruton, F.S.A., and the hon. local secretary, Mr. H. Hurst, B.A., subsequently proceeded to the examination of the Radcliffe Library, the Bodleian Library, where the librarian received and addressed the visitors, the Divinity School, and the Ashmolean Museum. In the evening a public dinner took place at the Randolph Hotel. The Earl of Winchilsea and Nottingham presided. On Tuesday the members inspected Merton, New, and Christ Church Colleges. In the afternoon the party paid a visit to the new Museum in the Parks, and in the evening papers were read in the new Examination Schools, which have been lent to the members of the congress for that purpose during the week.

EXETER DIOCESAN ARCHITECTURAL SOCIETY.—The annual meeting of the Exeter Diocesan Architectural Society was held in the College Hall on Tuesday, June 24th, the Archdeacon of Exeter taking the chair. The secretary, Rev. J. L. Fulford, read reports—one of the visit of the Society to several North Devon churches, Crediton, Chittlehampton, Atherington, South Molton, West Anstey, describing the improvements that have recently and of late years been made in those churches, the arrangements for the excursion having been made by Rev. E. V. Freeman, also a secretary. A paper was read on "Mediæval Decoration" by Mr. C. J. Tait, architect, well illustrated, describing modes of colouring wall surfaces, examples of stained glass, and glancing at more ancient art visible on the remains of Egyptian and Greek temples. The volume of "Essays," Vol. V. Part 2, new series, containing papers on "Church Plate," &c., was issued.

CHIPS.

Only one out of five candidates for the special higher sanitary science examination of the Surveyors' Institution passed—viz., Mr. P. E. Pilditch, of 17, Parliament-street, S.W.

The new French Hospital in Shaftesbury-avenue, built at a cost of £22,000, was opened on the 3rd inst. by M. Waddington, the French Ambassador, who announced that his Government had appointed Mr. Thomas Verity, the architect of the building, a Knight of the Legion of Honour. The new building contains 60 beds.

Friday was Speech Day at Uppingham School, and a numerous company assembled for the opening, by Lord Norton, of the new school-house and the tercentenary class-rooms, which have been erected from designs by Mr. T. Graham Jackson, M.A.

At the last meeting of the Newark-on-Trent town council, the Castle Gardens Committee reported that the work at the castle for the preservation of the ruin had been begun, and that Mr. Bradshaw had been engaged as foreman at a salary of £2 per week, and that the work would be done under the direction of Mr. Hodgson Fowler, F.S.A.

The Queen has consented to open the large new deep-water dock at Southampton, which is to be named the Empress Dock, in honour of her Majesty. The ceremony will take place on the afternoon of Saturday, the 26th inst.

A fire broke out on Saturday morning in the steam saw-mills of Messrs. Cotton and Smith, between the Kingsland-road and the Hackney-road. Great damage was caused, not only to the main premises, but to a number of adjacent houses and workshops.

New premises are about to be built in Liberton-road, Edinburgh, for the housing of the Industrial Home for Fallen Women. The building will be two stories in height, will accommodate 32 inmates, and will cost about £2,000. The architect is Mr. Robert Wilson, Queen-street, Edinbugh.

King Humbert assisted on Sunday at the inauguration in Rome of the first electric tramway constructed in Italy. It runs from the Porta del Popolo to the Ponte Molle, about a couple of miles outside the gates. The engineers are Messrs. Ritchie and Mandell, and the whole of the machinery has been sent from England.

The foundation-stone of the Mears' Memorial schools attached to the Wesleyan Chapel at Bitterne, near Southampton, took place last week. Mr. Witt, of Bitterne, is the builder.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLVI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—W. McF. and Co.—J. F. and Co.—T. P. L.—W. E. and Co.—T. and Co., Ltd.—H. E. and Co.—W. G. P.—J. W. S. and Co.

W. M. TOLLIT. (There is no doubt that the plans are the property of the client. The matter has never been carried to the highest authority; but so far as it has been carried, the decision has been unfavourable to architects.)

Intercommunication.

QUESTIONS.

[10313]—**Columns.**—Will Mr. G. A. T. Middleton be good enough to explain the meaning of C in his chapter on "Columns and Struts"? Will he work the formula in figures?—BORE.

[10314.]—**Ancient Lights.**—Will some kind reader help me out of a curious difficulty? A. has a window 4ft. wide, 3ft. 9in. high, fixed in the gable end of a house overlooking B.'s land; the sill is 2ft. 6in. off the ground level. How close can B. build up to A.'s window?—J. BROOKE, Crewe.

REPLIES.

[10310.]—**Quantity Surveying.**—London surveyors, as a rule, do not deduct brickwork where against stonework, unless the latter is *more* than 6in. high. The item of "*Fir in ground-floor joists and sleepers*" is taken apart from upper floors, the latter being billed as "*Fir framed in floors.*" Under this rule it will be observed that in the case of a basement having a wood floor and joists, the floor near the ground level becoming an upper floor, is classed with the "Fir framed in floors." Fletcher's table, although rendered in unusual order, confirms this principle. The several parts in ordinary roof work are billed together as "*Fir framed in roofs*," at per foot cube, although some surveyors prefer to super ridges, hips, and valleys, stating thicknesses. Roof trusses necessarily receive special treatment in bill, and in addition an item is usually allowed for hoisting each truss. Generally speaking, even the present London method of dealing with "*Fir framed*" is open to grave objections, particularly when applied to floors.—H. BUSHELL.

At the monthly meeting of the Bolton Town Council on Wednesday the salary of the borough surveyor (Mr. J. H. Brockbank) was raised from £250 to £350 per year.

Under the terms of the Chantrey Bequest, the Royal Academy Council have purchased Mr. George Clausen's "Girl at the Gate," from the current exhibition at the Grosvenor Gallery.

LEGAL INTELLIGENCE.

A BUILDER AND FISHMONGER.—BENNETT v. WHISTOOKE.—At the Wandsworth County Court on Tuesday week, the plaintiff, a plumber, of Streatham, sued the defendant, a fishmonger, of the same place, for £13 13s. 4d., the balance of contract, £23 13s. 4d., for building a stable, &c., at Greyhound-lane, Streatham Common. This case was first heard on April 29th, and was referred to Mr. R. M. Hiscocks, the surveyor, to measure up the works in dispute and report to the Court. The referee now handed in his award, the finding being for £19 18s. 4d. for all works executed. The defendant put in a counter-claim of £2 12s. for goods supplied, also a set-off of £10, cash paid on account, leaving a balance of £7 6s. 4d. due to the plaintiff. His Honour gave judgment for plaintiff for £7 6s. 4d. with costs. The £7 8s. was paid into court by the defendant too late to save costs.

WHAT IS A "STREET?"—THE QUEEN v. THE MAYOR AND CORPORATION OF MIDDLESBROUGH.—(Queen's Bench Division, July 6. Before Lord Coleridge and Mr. Justice Wills.)—This case raised a question under the Act of 1888 to amend section 156 of the Public Health Act, 1875, by substituting for his enactment—"That it shall not be lawful in any urban district, without the written consent of the urban authority, to erect or bring forward any house or building in any street, or any part of such house or building, beyond the front main wall of the house or building on either side thereof in the same street, nor to build any addition to any house or building beyond the front main wall of the house or building on either side of the same." The question had arisen as to the effect of this enactment in cases of new streets only laid out or with a few scattered houses at considerable distances from each other. It had arisen at Middlesbrough, where a new street had been laid out by the corporation on one of the main roads or approaches to the town, and which they were anxious to make as spacious as possible. The old by-laws, before the late Act, required plans of new buildings to be laid before their surveyor, and these required the width of a front street to be 48ft. The new street was called Almerston-street, and it was in line with a road 50 years old—Woodland-road—in which there were one or two houses set back 30ft. A person who proposed to build a house in the new street sent in a plan, which showed that it would be set back 30ft. There was in the new street only one house erected or set back, and that was 800ft. distant, while the one in Woodland-road was above 400ft. off. On reconsideration the builder proposed not so to set back his house, and he sent in another plan showing it not set back, which the corporation would not approve of. The builder applied for a *mandamus* to the corporation to approve the plan. A house in the same road was set back 70ft. Mr. R. S. Wright, for the corporation, sought to show cause against the application for a *mandamus*. Mr. J. Forbes, Q.C., appeared for the builder in support of his application for a *mandamus*, and urged that these were different streets, one being 40 years old and one other only laid out with one or two houses in it, and that in the new street the nearest house set back was 800ft. distant, and the other was set back 70ft. [Mr. Justice Wills: If the corporation are justified in requiring the proposed house to be set back 30ft., they might as well require it to be set back 70ft.] Just so. There is no house at present on "either side" of the site of the proposed house. The Court said the case was clear. The new road was not yet a street, and there were no houses on either side of it," so that the enactment did not apply. They held, therefore, that a *mandamus* must issue—that is, unless the corporation approve the plan in accordance with the opinion of the Court.

ST. ALBAN'S CATHEDRAL.—Mr. G. H. Knight, the registrar of the diocese of St. Alban's, has held a court at the cathedral to receive notice of any opposition to a petition by Mr. Hucks Gibbs for a faculty to complete the high altar screen. Mr. Sharp appeared on behalf of Mr. Gibbs. No one appeared to oppose the petition, and the registrar intimated that the faculty would be granted. Mr. Gibbs asks for a faculty to complete the statues on the screen, also to put a stone cross on the blank space in the centre, and a sculptured group in the panel over the altar, representing the body of our Lord taken down from the cross—this group is proposed to be executed in wood, stone, or terra-cotta, and coloured.

IN RE QUINN.—An adjourned meeting of creditors has been held under the failure of Mr. Thomas Quinn, M.P. for Kilkenny, and described as of the State-office, Popham-street, Islington, builder and contractor. The failure occurred in January last, the liabilities being returned in the statement of affairs at £75,748, of which £11,260 only had been proved, with assets £919. Resolutions were passed accepting a composition of 3s. in the pound, payable in 6d. in cash, and 1s. 6d. in six months.

FREEHOLD PROPERTY AT STRATFORD.—The Inspire (Mr. Henry Currey, F.R.I.B.A., of Norfolk-street, Strand), in the compensation case of Carder and Clarke v. West Ham Corporation, has issued his award for the sum of £15,705. In connexion with the widening of High-street, Stratford, Messrs. Corder and Clarke claimed together compensation to the amount of about £25,000 for the compulsory purchase of their freehold interest in a corner plot of house and shop property, with frontage to High-street and to Chapel-street, comprising a superficial area of 35,623ft. In evidence on behalf of the claimants, Mr. R. Reid valued at a total of £23,725; Mr. A. Garrard, at £22,498; and Mr. W. J. Beadel, M.P., at £21,252. On behalf of the corporation, Mr. W. Eve valued the whole property at a total of £11,857, excluding the usual 10 per cent., but subject to a reduction of £1,000 on account of the property being held in undivided moities. Mr. E. Ryde valued at £10,200 (setting reduction of value on account of divided ownership against forced sale allowance); Mr. T. Chatfeild Clarke valued at a total of £11,934, less £1,000, as above.

RE WILLIAMS, FRY, AND CO.—A meeting for public examination was held before Mr. Registrar Linklater on Tuesday, the bankrupts being described as of New Stone-buildings, Chancery-lane, and of Stone, Greenhithe, cement merchants. The liabilities are £9,347, of which £3,681 are expected to rank, the assets showing an estimated surplus of £423. The bankrupt Fry, examined, stated that he became associated in business with Mr. Williams in March, 1887. They were general traders, and undertook building and engineering contracts. A capital of £3,000 was brought in by Williams in 1888; but prior to that time they had a large amount of liquid assets. He knew when he joined Williams that they could finance to the extent of £2,000 or £3,000. They built a laundry at Ealing at a cost of £5,000 for the Ealing Sanitary Laundry Company. He was honorary secretary and director of the company, Williams being a director, but they resigned their appointments prior to these proceedings. He (Fry) promoted the company, and the preliminary expenses of promotion were paid by the company. In December, 1887, they took land at Stone and ran up a cement manufactory, spending £7,000 or £8,000 thereupon. That business was also turned into a limited company. The proceedings were adjourned in order that the bankrupts might comply with certain requisitions.

CHIPS.

The parish church of Longridge, near Preston, has just been entirely rebuilt, at the cost of £10,000, from the designs of Mr. Ewan Christian. It is Gothic in style, and is seated in oak for 700 worshippers.

The annual meeting of the National Association of Builders and Contractors of Great Britain will be held at Southampton on the 23rd inst. The proceeding will take place at the Hartley Institution, by permission of the Southampton Corporation.

The small building in Aston-lane, Birmingham, which has been used as a place of worship for the Wesleyan body at Perry Barr, is to give way to a new and larger chapel. Recently the trustees adopted the plans of Mr. T. Guest, Corporation-street, Birmingham, for a building in the Early English style, to be erected in front of the present chapel (which will form a school), at a cost of about £1,600. The work was placed in the hands of Mr. J. Simons, of Aston, and a series of memorial stones were laid on Monday. The chapel will have red brick facings and Bath-stone dressings. Accommodation will be provided for 400 persons. Exclusive of the chancel, which will have an octagonal end and traceried windows, the building will measure 54ft. by 37ft.

At a meeting of the committee of management of Nottingham University College, Mr. William Robinson, M.E., Senior Demonstrator in Electrical Engineering and Applied Physics, and chief assistant to the principal of the City and Guilds of London Technical College, Finsbury, was unanimously elected Professor of Engineering.

A new pulpit in carved oak, also sanctuary railing, carved pedestals for statues, and brass altar-lights, &c., have been added to the Roman Catholic Church of St. Joseph, Burwash. This work has been executed by Messrs. Jones and Willis, of London and Birmingham, from designs and drawings of Mr. Bernard Whelan, the architect to the church.

At a second meeting of the Bishop Parry Memorial committee, held on Wednesday at Lambeth Palace, Mr. James Forsyth, sculptor, exhibited a clay model of a recumbent figure, and various plans for a base. Suggestions were made as to slight alterations in the figure and to the subjects to be represented on the base. The latter were all unanimously agreed to. The effigy is to be placed in the nave of Canterbury Cathedral, and to the west of the recumbent figure of Archbishop Sumner. The monument is to cost £1,000.

Our Office Table.

THE new Art Gallery of the City Corporation adjoining the Guildhall is now open free daily from 10 to 6, and contains a remarkable and interesting loan collection. The pre-Raphaelites are well represented—Dante Gabriel Rossetti by the well-known "Sibylla Palmifera" and "The Beloved"; Ford Madox Brown by his realistic "Work" and "Don Juan Discovered by Haidée"; Holman Hunt by "Two Gentlemen of Verona," "The Triumph of the Innocents," and "Isabella and her Basil Pot"; and Burne-Jones by the "Chant d'Amour." Millais only appears as a landscape painter; but one of the two works is "Chill October," the other "The Meeting of the Waters." Sir Frederic Leighton's "Alcestis," G. F. Watts's portraits of William Morris and the Marchioness of Granby, J. F. Lewis's "Lilium Auratum," and Briton Riviere's "Daniel in the Lions' Den" are well worthy of a visit; while among other contemporary painters represented are Vicat Cole, Peter Graham, Hook, Williams, Leader, Goodall, Brett, and Faed. Works by Hogarth, Reynolds, Lawrence, Landseer, David Roberts, Maclise, and Holl are also hung, as well as a few by the Old Masters, including the "Christ at Gethsemane," by Raphael, lent by the Baroness Burdett-Coutts, and examples of the Dutch School from the Northbrook collection. The loan exhibition will be kept together till August 31st.

THE prize list at University College, London, for the classes of architecture, conducted by Professor T. Roger Smith, F.R.I.B.A., is as follows:—In the Fine Art branch the Donaldson Silver Medal is taken by C. C. Brewer, of Finchley, and the second prize by Kotaro Sakurai, who, as his name suggests, is a Japanese student. Alfred Hale, of Birmingham, is placed third, and receives a certificate, having obtained the number of marks qualifying for a prize. The second class is headed by F. K. Kendall, of Blackheath; and the third class by R. M. Whellock, of Nunhead. Kotari Sakurai also carries off the prize for Sketches, and the Donaldson Silver Medal in the branch of Construction. In this branch F. J. Slater, of London, takes the second prize, and T. A. Brooks and E. B. Hoole, both of London, are placed in the second class. The prize in the modern practice branch goes to Louis Jacob, of New Cross; Dendy Watney, of Croydon, who obtained the number of marks qualifying for a prize, receiving a certificate, and H. R. Appelbee and H. Helsdon, both of London, being named in the second class.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—St. Paul's Archæological Society. Visit to Coventry. Train from Euston 9 30 a.m.

TUESDAY.—Royal Society of Antiquaries of Ireland. Meeting at Athlone.

SATURDAY, JULY 19.—Association of Municipal Engineers and Surveyors. Home District Meeting at Croydon. Assemble at public baths in Birchanger-road, near Norwood Junction, 11 a.m.

Glasgow Architectural Association. Visit to Kinning-park R.C. Church, Fairfield offices, and Govan Chapel.

Architectural Association, 9, Conduit-street, W.—The Visit to Holland House will be made on July 26. Names to be sent to Mr. Owen Fleming, with 1s., as announced in *A.A. Notes* for July.

FRED. R. FARROW. } Hon. Secs.
ERNEST S. GALE. }

Sir Benjamin Baker has accepted the post of engineer to the Watkin Tower Company.

On Saturday the foundation stone of St. George's Church, Westcombe Park, was laid. The church, which is situated in the Glenluce-road, is being built from the designs of Messrs. Newman and Newman, of Tooley-street, by Messrs. Balaam Brothers, of the Old Kent-road. The style is Early French, the walls being of red brick with Bath-stone dressings. The cost of the first section, consisting of four bays of the nave, with parish-room beneath, will be £5,100. The total cost of the church when completed with nave and side aisles, tower, and spire, is estimated at £8,500. The portion now being built will seat 600 people.

On Tuesday week the memorial-stones were laid of a new Wesleyan chapel and Sunday-school at Downderry, Liskeard. The erection of the buildings is being carried out by Mr. T. E. Madams, from designs by Mr. H. J. Snell, architect, of Plymouth.

Holloway's Pills.—The Great Need.—The blood is the life, and on its purity depends our health, if not our existence. These Pills thoroughly cleanse this vital fluid from all contaminations, and strengthen and invigorate the whole system, healthily stimulate sluggish organs, and establish order of circulation and secretion throughout every part of the body.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

Brierley, J. W., Ashton-under-Lyne ...	1,143 6 9
Garside, Barnes, & Co., Stalybridge	1,110 18 7
Underwood Bros., Dukinfield ...	1,094 4 1
Worthington and Pownall, Manchester (accepted)...	1,038 16 1

Surveyor's estimate, £1,080 0s. 7d.

AUDENSHAW.—For sewering, paving, flagging, and kerbing Harrop-street. Mr. J. H. Burton, Ashton-under-Lyne, surveyor:—

Hayes, P. D. and S. D., Stockport ..	£185 15 1
Neal, W., Ashton-under-Lyne ...	181 17 0
Stirling and Swann, Manchester ...	178 10 1
Brierley, J W., Ashton-under-Lyne	171 7 4
Garside, Barnes, & Co., Stalybridge	164 19 9
Underwood Bros., Dukinfield ...	164 2 3
Worthington and Pownall, Manchester (accepted) ...	157 19 8

Surveyor's estimate, £162 18s.

AUDENSHAW.—For paving, flagging, and kerbing Nelson-street. Mr. J. H. Burton, Ashton-under-Lyne, surveyor:—

Hayes, P. D. and S. D., Stockport...	£173 14 1
Neal, W., Ashton-under-Lyne ...	165 16 8
Garside, Barnes, & Co., Stalybridge	160 0 2
Brierley, J. W., Ashton-under-Lyne	159 11 3
Stirling and Swann, Manchester ...	154 6 2
Underwood Bros., Dukinfield ...	151 18 6
Worthington and Pownall, Manchester (accepted) ...	143 14 3

Surveyor's estimate, £148 2s. 3d.

BATTERSEA, S.W.—For supplying heating apparatus on the low-pressure hot-water system to a school now in course of erection on the Latchmere site, Battersea Park-road; also for extending the apparatus to the graded school, for the London School Board:—

Phipson, W. W.	£1,150 0 0
Wagstaff, J. G...	961 0 0
Longden and Co.	866 10 0
May, J. and F.	862 0 0
Kinnell, C. J., and Co.	850 0 0
Rosser and Russell	764 10 0
Wontner Smith, Gray, J., and Co....	759 0 0
Purcell and Nobbs (accepted) ...	634 0 0

BIRMINGHAM.—For alterations to premises, Edmund-street, for Messrs. A. Field and Co. Messrs. J. A. Cossins and Peacock, architects. Quantities by Mr. G. Kenwick:—

Smith, J., and Sons (accepted) ...	£553 0 0

BLACKFRIARS.—For recent new stabling and cart shed; also alterations and repairs at The Rotunda, Blackfriars-road, for Messrs. A. Levey and Co., brewers, Dover and London. Messrs. Dunk and Bousfield, 9, Billiter-square, E.C., architects and surveyors:—

Colls and Sons	£1,300 0 0
Rider and Son	1,281 0 0
Stiff, Dover	1,030 0 0
Munday, G., and Sons	936 14 0

COLWYN BAY, NORTH WALES.—For the pulling down, removal, and re-erection—with additions—of gymnasium, greenhouses, &c., Rydal Mount, Colwyn Bay, for Mr. T. G. Osborn, M.A. Mr. T. E. Lidiard-James, Lonsdale Chambers, 27, Chancery-lane, London, architect:—
Foulkes, E., Colwyn Bay (accepted).

COLWYN BAY, NORTH WALES.—For additions to Rydal Mount, for Mr. T. G. Osborn, M.A. Mr. T. E. L. James, Lonsdale Chambers, 27, Chancery-lane, London, architect. Quantities by Messrs. Evans and Deacon, Charing Cross, S.W.

	A.	B.
Shillitoe, J., and Sons, Bury St. Edmund's	£5,875	£200
Herbert, T. and H., Leicester	5,598	225
Gabbutt, E., Liverpool	5,592	234
Foster and Dicksee, Rugby...	5,555	222
Parry, S., Llanrwst	5,498	285
Foulkes, E., Colwyn Bay	5,350	350
Gethin, J., Shrewsbury	4,950	175
Jones, J. B., Llanwrst	4,800	178

A.—Main building. B.—E.C. block.

EALING.—For the enlargement of superintendent's lodge, erection of a cottage and sundry works at Ealing Cemetery, for the Ealing Burial Board. Mr. R. Willey, F.R.I.B.A., 66, Ludgate Hill, E.C., architect and surveyor:—

Nightingale	£1,775 0 0
Jones	1,753 0 0
Knight...	1,700 0 0
Myring	1,640 0 0
Penny and Co.	1,630 0 0
Nye	1,446 0 0
Down	1,428 0 0
Dorey	1,385 0 0

ENFIELD.—For the new church of St. Mark, Bush-hill Park (exclusive of south aisle). Messrs. J. E. K. and J. P. Cutts, 28, Southampton-street, Strand, W.C., architects:—

Patman, L. and W. D., Enfield ...	£3,975 0 0
Fairhead, A., and Son, Enfield ...	3,650 0 0
Bently, J., Waltham Abbey (late)	3,498 0 0
Porter, A., Tottenham	3,487 0 0
Taylor and Son, Holloway ...	3,477 0 0
Tyerman, J., Walworth* (corrected amount)	3,399 0 0

* Accepted with deductions.

EXETER.—For sanitary alterations, &c., at the West of England Eye Infirmary. Mr. C. Cole, Queen-street Chambers, Exeter, architect:—
Plumber's work:—Hubber and Son.
Mason's work:—Scadding and Son.
(No competition.)

EXETER.—For general repairs and alterations at the Queen's Head p.h., for Messrs. Ross and Pidsley. Mr. C. Cole, Queen-street Chambers, Exeter, architect:—
General work:—Ham and Passmore (accepted)
Painter's work:—Down, J.
(Lowest tenders received.)

EXETER.—For sanitary alterations at the Exeter Bank. Mr. C. Cole, Queen-street Chambers, Exeter, architect:—
Tree and Bolley (accepted).

EXETER.—For new stabling, &c., at the Three Tuns p.h., for Messrs. Ross and Pidsley. Mr. C. Cole, Queen-street Chambers, Exeter:—
Heath and Smith (accepted).
(Lowest tenders received.)

EXETER.—For sanitary alterations at St. Leonard's Lawn. Mr. C. Cole, Queen-street Chambers, Exeter, architect:—
Sharland, T. (accepted)
(No competition.)

FORFAR, N.B.—For hydraulic ram and piping for water supply to South Leckaway Farm, for the Earl of Strathmore. Mr. J. A. Ferguson, Glamis, surveyor:—
McBeth and Milne, Forfar (accepted).

GLAMIS, N.B.—For porch and repairs to house at Upper Hayston, for the Earl of Strathmore. Mr. J. A. Ferguson, Glamis, architect:—
(Accepted tenders.)
Mason:—Johnston, J., Glamis.
Joiner:—Johnston, G., Glamis.
Plumber:—Langlands, D., Forfar.
Painter:—Martin, J. D., Kirriemuir.

GUILDFORD.—For the erection of a new golf-house Merrow Downs, Guildford, for the Guildford Golf Club Mr. A. J. Sturges, architect:—

Mitchell Bros., Shalford	£1,896 0 0
Ellis, S.	1,670 0 0
Milton, F., Witley	1,646 0 0
Smith, R.	1,549 0 0
Strudwick, G....	1,539 0 0
Garnett, G.	1,513 0 0
Kingerlee, T. H., Oxford	1,495 0 0
May, P. C.	1,478 0 0
Wood, R.	1,439 0 0
Downes, T. E. (accepted)	1,369 0 0

Rest of Guildford.

HANWELL.—For alterations at the Central London District Schools, Hanwell, for the managers. Messrs. F. Jarvis and Son, architects:—

Brass and Son	£13,550 0 0
Stimpson and Co.	12,940 0 0
Flew and Co.	12,700 0 0
Kirk and Randall	12,650 0 0
Gibson, Southall	12,385 0 0

HEREFORD.—For laying down new system of drainage at the Working Boys' Home, Hereford. Mr. C. H. Goodsell, 20, East-street, Hereford, architect and surveyor:—
Andrews, R. (accepted).

HERTFORD.—For new station hotel, Hertford. Mr. J. Farley, Hertford, architect. Quantities by Mr. T. J. Pietersen, 191, Euston-road, London:—

Harris and Wardrop, London ...	£2,700 0 0
Faulkner, J. W., London	2,095 0 0
Dove, H. M., Watford	2,030 0 0
Hunt, T., Ware	1,990 0 0
Norris, H., Hertford	1,963 0 0
Miskin, C., St. Alban's	1,963 0 0
Hunt, J. A., Hoddesdon	1,950 0 0
Kirk and Randall, Woolwich ...	1,941 0 0
Claridge and Bloxham, Banbury...	1,897 0 0
Wallis, G. E., & Sons, Maidstone	1,888 0 0
Bell, W., & Sons, Saffron Walden	1,867 0 0
Halliday, S. F., Stamford	1,862 0 0
Pattinson, S. and W., London ...	1,850 0 0
Wilmott, J., and Sons, Hitchin ...	1,800 0 0
Dupont, F., Colchester	1,793 0 0
French and Ellwood, Sandy ...	1,746 0 0

HORLEY.—For the erection of six shop-fronts, offices &c., in High-street, Horley, for Mr. W. E. Challis, West street, Horsham, architect:—

Brown, J. (accepted)	£300 10 0

ISLINGTON.—For alterations, fittings, &c., at the Four Islington-green, N. Mr. R. J. Lovell, 46, Queen Victoria street, E.C., architect:—
Ivory (accepted)

KILBURN, N.W.—For providing new boiler for the existing low-pressure steam apparatus at the Netherwood street School, Kilburn, and for extending this apparatus to the enlargement (now in course of erection), for the London School Board:—

Potter, T., and Sons	£861 0 0
Wontner Smith, Gray, J., and Co....	760 0 0
Green and Son, Ltd.	666 0 0
Purcell and Nobbs	664 0 0
Grundy, J.	597 0 0
Rosser and Russell (accepted) ...	575 0 0

LEE, KENT.—For additions to the Hedgley-street Public Schools. Messrs. J. E. K. and J. P. Cutts, 28 Southampton-street, Strand, W.C., architects:—

Turtle and Appleton, Clapham Junction	£1,568 0 0
Nightingale, B. E., Albert Embankment (accepted)	1,508 0 0

LEOMINSTER.—For alterations and additions to Upper Hill School Church, near Leominster, Herefordshire. Mr. C. H. Godsell, 20, East-street, Hereford, architect and surveyor:—

Griffiths, J.	£148 18 0
Fox, J.	110 15 0
Davies, J. J. (accepted)	98 10 0

LONDON.—For erecting St. Matthew's Church-room Warwick-road, Upper Clapton, for the building committee Messrs. Mitchell and Butler, architects:—

	A.	B.
Williams, G. S. S. and Sons	£2,555 0 0	£140 0 0
Scrivener and Co. ...	2,306 0 0	129 0 0
Morter, J.	2,264 0 0	139 0 0
Anley, J.	2,230 0 0	125 0 0
Cox, C.	2,227 0 0	121 0 0
Coldwell and Sons ...	2,216 0 0	124 0 0
Chesham and Sons...	2,2 0 0 0	139 0 0
Roome, E.	2,101 0 0	103 0 0
McCormick & Sons*	2,099 0 0	98 0 0

*Accepted.
A.—Building. B.—Boundary walls, gates, &c.

LONDON.—For new showrooms at Dorset Works, Eas road, City-road, for Messrs. Dottridge Bros. Mr. A. C Collins, 52, Finsbury-pavement, E.C., architect:—

Roome, E. A.	483 0 0
Nixon, T.	445 0 0
Godfrey, J., and Son, Clapton* ...	444 0 0

* Accepted.

LONDON.—For lowering basement floor, new buffet, an lavatories, and various alterations at 122, Newgate-street E.C., for Messrs. Diviani Bros.:—
Williams, H. J., Bermondsey-street £837 10 0
(No competition.)

LONDON.—For sundry alterations and repairs to Nos. and 4, Evelina-road, Peckham, S.E. Mr. F. G. Grierson 9, Old Jewry Chambers, E.C., architect:—
Hollingsworth, H. H., High-street, Peckham.

LONDON.—For the supply of drawing desks of an improved pattern to the schools of the London School Board

	No. 1 size. Each.	No. 2 size. Each.
Hammer, G. M., and Co....	£2 0 0	£2 0 0

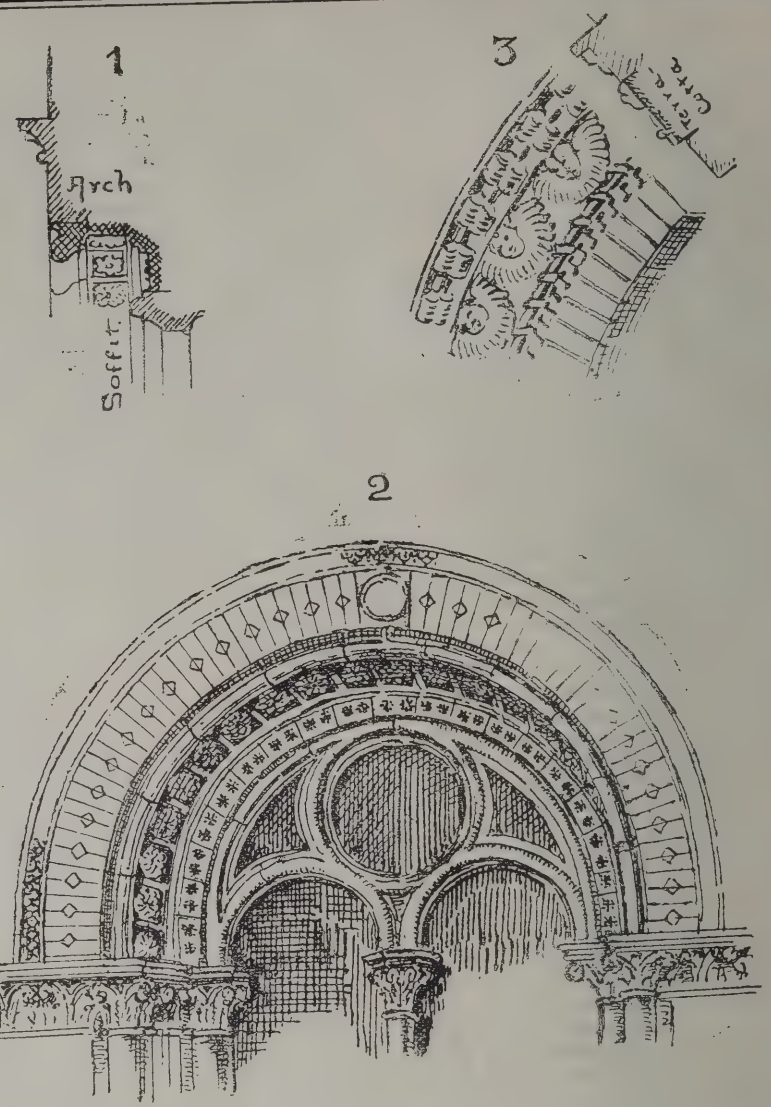
AND ENGINEERING JOURNAL.
VOL. LIX.—No. 1854.
FRIDAY, JULY 18, 1890.

SKILFUL ARCHITECTURE.

PROBABLY the greater number of successful buildings have been the result of fortuitous circumstances—either a happy hit, or a leisurely solution of the problem. In these days of high-pressure, competition, and contract, the possibilities of a particular design for any structure can seldom be compassed; the architect has no time, if he is in a large practice, to study the problem of plan; he cannot, for instance, make a number of studies for a certain site, and revert to them at intervals of leisure to improve and develop; but is, perforce, obliged to speedily fix upon one idea and work it out. The contract drawings cannot wait for modification and improvements; but must be commenced forthwith, even before the idea has been digested, and often while another and happier conception crosses his mind. These afterthoughts, often simpler and happier modes of dealing with the problem, prey upon an uneasy mind, willing to adopt the most advantageous course, but unable to entertain it for a moment. The first idea, crude though it be, is drawn to scale, and its shortcomings grow more apparent and aggravating. If the design be for a competition, it is not long before the author is made aware of the weakness of his scheme. Some other competitor has hit upon a plan that is obviously better than his own, and he has to endure the mortification of having been beaten in the contest. Whatever may be its drawbacks, this is one of the undoubted advantages secured by competition. Out of several competing designs, one or more is likely to come within a measurable distance of the mark.

A chief cause of the failure of so many designs, prepared with infinite trouble and labour, is the not knowing What and How to provide? Only a few architects master the requirements of particular buildings—the very first step that can insure success. What can a man practised in ordinary house-building know of the requirements, say, of a hospital or a union workhouse ward? He may be a good architect, and have designed villas and churches and schools, but he knows absolutely nothing of the regulation types of hospital construction. And yet we find men who throw in their chances against experts in buildings of this kind, and wonder how it happens they do not win against Mr. So-and-So, a Local Government Board official, or Mr. Smith, whose skill and experience of such buildings have made him a very successful competitor for hospitals and infirmaries. Mr. Turn-his-hand-to-anything, architect, has so firm a conviction in his own power that he scruples not to engage in conflict with such specialists; but the odds are against him. His plan is laboured, the evidence of patient, plodding toil by the combined aid of Blue-book instructions, designs from the professional journals, and oil-lamps; Mr. Smith's plan is simple, straightforward, and masterful in its arrangement of requirements. One is a roundabout, intricate, confused plan, indicating a mind that cannot grasp the essentials. It shows plenty of "beating about the bush," all to little purpose: the other deftly hits the mark; it goes straight to the solution without bewildered effort, while the whole simplicity of its lines show that the author possessed the secret—the key to the problem. He had, in short, mastered the requirements of the design. And this kind of masterly knowledge assimilates genius. One who has made himself master of a problem, who knows what is necessary and what non-essential, has the power to present it in a light which the uneducated cannot do by groping about in a maze of uncertainties. Therefore we say that an architect who has imperfectly acquired the essentials of any class of building is unable to present his ideas in any other than a confused form.

One indication of this power is the ability to grasp the main parts of a design. Does the building shape itself to the ground? Do the lines of the principal departments locate themselves well on the site? Are the axes of the main apartments arranged to give effective grouping and outline? These are a few of the leading marks of successful architecture. Let us look, for example, at the designs for the Sheffield Municipal Buildings, the site for which is trapezoidal in shape, and see how these principles are illustrated. There were clearly two methods of planning the structure: first, to make the walls parallel to the principal boundaries, and the cross walls at right angles thereto; second, to place them on the square, thus sacrificing triangular spaces on the oblique or Cheney-row boundary. Mr. E. W. Mountford, in his able design selected by Mr. A. Waterhouse, and illustrated by us (June 27), has chosen the latter alternative: his apartments are all square. Whatever may be the merits of the other premiated designs, there is no doubt that the designs of Mr. Mountford and Mr. Hare exhibit, in selecting the rectangular principle of planning, decided advantages. As three of the four sides of the quadrangle are on the square, unlike the triangular Manchester Town Hall site, the architects were justified in adopting this principle, and they have thereby emphasised in the external design the principal departments; thus the council chamber and the mayor's suite of apartments towards Pinstone-street are pronounced portions of the design set square. These latter rooms can be thrown into one grand hall. Another axiomatic principle is illustrated in the accepted plan; the two main entrances and corridors are arranged at right angles, and intersect in an octagon near the Cheney-row side. The author has evidently designed his elevations as outgrowths of the plan. Less apparent is the position assigned to the angle tower, which would more naturally have been placed over one of the main entrance halls. It looks a little like an interpolation; but the author assigns a good reason for putting it at the corner—namely, that it should forcibly strike the eye at the corner of the two main streets. It certainly aids the perspective, and separates the two fronts. Looking at the plan again, the apartments shape themselves fairly well to the site; their axes are simply arranged, the main ones parallel to the shorter street. Mr. Hare's plan is equally clever; perhaps in its general location of apartments it illustrates more forcibly the principles we have mentioned. We find that the author's general idea, the key-note of the whole design, is the position assigned to the general offices of the borough accountant and waterworks department. These offices being large, they are placed in the centre of building, and are top-lighted. Their main axis is central and transverse, and coincides with that of the council-chamber above. The light areas are well distributed; the corridors and halls are happily planned for internal effect—their axes are straight and at right angles. Looking at the main apartments of the principal floor, we find that their lines locate themselves well; the alignment of offices is easily followed. Mr. Tulloch's design, which we have also illustrated, shows the second principle of planning, the walls of the oblique side running parallel thereto, but the author has skilfully arranged his main blocks; these are placed at right angles to the long front. There is the state apartment block, the council-chamber and borough accountant block, and the general office block at the short side. Between the two first a transverse block in the centre connects them, leaving two courtyards for light. This is the scheme. The lines of walls are straight, and the blocks tolerably emphasised externally.



Now it is precisely this arrangement and grouping of the departments, this orderly marshalling of chambers and offices, that distinguishes the skilful from the unskilful designs. The design of great buildings like the Palace of the Legislature, the Law Courts, St. George's Hall, Liverpool, Manchester Town Hall, and many others, show that all the talent and skill consist in arranging and grouping together certain blocks of building more or less decorated into one harmonious assemblage. The details may be good or indifferent. This way of looking at architecture does not commend itself to those who think it immaterial how the parts are put together so long as they give attractive elevations. Nevertheless, it is one of the indubitable marks of ability and skill. A skilful author marshalls and groups his facts, throws his ideas into some order, and presents them to the reader in as simple and telling a form as possible. What is true of the word-painter is also true of the artist in fiction, dramatic plots, in painting, and sculpture. He seeks to gather his ideas into a few telling expressions, plots, or touches—the simple or more striking the better. But the unskilful plods and blunders: he takes an indirect way of appealing to the mind or the emotions; his expressions are clumsy and awkward, his plots without point or life, his touches feeble and untelling.

When we hear of more architects "patenting" their arrangements, as was the case with one firm in the Sheffield competition, an improvement in design may be hoped for. Uncertainty and feebleness appear to be the prevailing qualities of architectural design. A plan is begun before a deliberate choice has been made of the right principle. Too much has been left to luck and good fortune, too little to skill and knowledge of the requirements. Can we wonder that competition work is so often confused, without a scheme, and purposeless? Anything is often sent in for a plan which just satisfies the instructions; no attempt is made to dispose or adjust the parts: the consequence is a design marked by indecision, bewildering and incoherent plans and elevations. One other indication of skill in the design of buildings is that of simplicity and ease. A good design can always be apprehended easily: the mind and eye quickly comprehend the disposition; there is no confusion or intricacy, so noticeable in laboured and unskilful art. This is one of the hardest maxims to learn by the novice and unskilled architect. They think the more show and display of artifice, complication of arrangement, and intricacy of detail, the better. The idea is that the art of impressing the beholder is first to bewilder him, and next to captivate him by lavish ornament or attractive draughtsmanship. The *ruse* too often succeeds with ill-informed and unthinking spectators. Tower and dome, elaborate sky line, innumerable breaks, and redundant detail are mistaken for architectural skilfulness or beauty. The true artist, on the other hand, has the art of making these fall into their natural places, of knowing where to accentuate his design by the more impressive features, and where to produce quietness and rest in another part. The true aim of art being to "conceal art," the whole of a complex structure is simplified and reduced to a few leading features and groups; a kind of abstract is made of the several parts and

details; the masses, outlines, and features are regulated to a sort of rhythm which, while it impresses, does not distract the eye.

SETTING-BACK HOUSES IN NEW STREETS.

AN interesting question was raised the other day in the Queen's Bench Division, before Lord Coleridge and Mr. Justice Wills, respecting the application of a builder to erect a house in a new street at Middlesbrough. A plan was first sent in which showed the house set back 30ft., in a line with two houses in an old road which was a continuation of the new street; but afterwards he altered his mind, and sent in another plan showing the house not set back, which the corporation disapproved of. Thereupon the builder applied for a *mandamus* to the corporation to approve the plan. It was in answer to this writ that the corporation had to deal. Under the Act of 1888 there is an enactment to amend Section 156 of the Public Health Act, which runs as follows:—"That it shall not be lawful in any urban district, without the written consent of the urban authority, to erect or bring forward any house or building in any street, or any part of such house or building, beyond the front main wall of the house or building on either side thereof in the same street, nor to build any addition to any house or building beyond the front main wall of the house or building on either side of the same." The street at Middlesbrough had only a few houses at considerable distances apart, and the question was how the above provision applied in such a case, or to any new street. From the particulars before us, it appears that the corporation had laid out the new street on one of the main approaches to the town, which they desired to keep as spacious as possible. The old by-laws of the town provided for a width of street of 48ft. In the older part of the road there are one or two houses set back 30ft.; but in the new street there was only one house built at that distance back, and it was 800ft. away from the proposed house, another in the old road was set back 70ft., and this was 400ft. away. The question was whether these houses could be taken as a guide, or as controlling the line of any new house. The amended enactment we have quoted appears to make it clear that they must be taken as defining the limit; for it says distinctly it shall not be lawful to erect or bring forward any house "beyond the front main wall of the house or building on either side thereof," clearly implying that if there is only one house on either side, and however far off it may be, it should determine the line. On the part of the builder it was argued that these were different streets, one 40 years old, and one quite new, with only one or two houses built in it, and that the nearest of them was 800ft. distant; the other was set back 70ft. Mr. Justice Wills said if the corporation were justified in requiring the house to be set back 30ft., they might as well require it to be set back 70ft. The Court decided that the new road was not yet a street, and there were no houses on "either side of it," so that the enactment did not apply. The *mandamus* must therefore issue. The decision turned on the moot question, "What is a street?" which, until it is authoritatively settled, will give builders in newly-formed streets the right to defy the urban authorities. The point therefore is of great importance in the new districts of towns, and it is one which requires some amendment in the Act to meet the difficulty. It comes, in short, to this: that until a thoroughfare or road becomes a "street," the houses on either side, if few and scattered, do not determine the line of frontage. The meaning of the term street legally under the Public Health Act, "includes any highway (not being a turnpike road) and any public bridge (not being a county bridge) and any road, lane, footway, square, court, alley, or passage, whether a thoroughfare or not," a remarkable definition and of extraordinary latitude. The legal definitions given by judges are equally wide. Lord Chelmsford, in "Galloway v. Corporation of London," says: "The word street does not mean the roadway, but a thoroughfare with houses on each side"—a reasonably restricted definition, and one generally accepted; yet it was held by Justices Page Wood and Selwyn that, although the word "street" may include the houses fronting on a public thoroughfare, as well as the actual roadway or footways, yet the street, in the *primâ facie* meaning of the word, is confined to the roadway and footways. These are conflicting dicta of the Courts. But a "street" has a beginning. At first it may consist only of a roadway, rough and unfinished, with one or two houses, and then, according to Lord Chelmsford's definition, it cannot be called a street. How many houses are necessary to be built to entitle it to the name of street? For the purposes of the Act a prospective meaning should be understood; but the line of houses ought at least to be determined by the authority, and if only one house is erected that is set back, they ought to be able to require that new erections conform to the same line. On what other ground can we expect uniformity or compliance with the Act? If the dictum is to be accepted that a new road with one or two houses in it is not yet a street, and that if houses "on either side" is meant to mean those immediately adjacent, we are obliged to arrive at the conclusion that all unfinished roads are not streets, and that a builder can erect his houses as near as he likes to the roadway. But this difficulty could not occur if properly defined lines were laid down on the plans of new roadways sanctioned by the authority. The unfortunate rule whereby the "written consent" of an authority is required, leaves the door open to many manœuvring builders, and as we have pointed out in other cases, it may be sometimes so relaxed as to afford no protection to the public, and may reduce an Act to mere useless form in the case of those who will take the trouble to evade it, and have the boldness or effrontery to defy the authorities.

ARCHITECTURAL BRICKWORK.—XXXVI.

ORNAMENTAL ARCHES.—BRICK AND TERRA-COTTA.

VERY effective combinations of brick and terracotta are to be found in many of the Italian and North German churches. The architect has now a good choice in the selection of these materials, and the arches produced by them are capable of far more variety than can be obtained on stone or brick alone. The arch itself may be formed of moulded bricks, with terracotta for the label and edge mouldings. The Romanesque buildings afford instances of the admixture, the principle to be observed being to use the terracotta for the ornamental portions and mouldings, and the brick for the construction. By this means the lines and arrises of the mouldings and ornamental relief have all the sharpness and precision due to harder material, and the longer pieces can be made to the curvature of the arch. Of recent examples the large, deeply-recessed doorway of the Natural History Museum, Kensington, may

be instanced as an excellent specimen of moulded and enriched membering, though in this case no bricks are employed visibly. In France moulded terracotta for arches and vaults has been extensively used, and one of the best applications of the material to the latter purpose is the vaulted ceiling of the church of Neuilly, near Paris, designed by M. Simonet. Lately, brick and terracotta have been very successfully used by Messrs. George and Peto in several recent buildings, and we may mention the terracotta arches in long and short courses in the Prudential Insurance office, Holborn, and the Hotel Métropôle, Brighton, by Mr. A. Waterhouse, R.A.

SOFFITED ARCHES.

Where thickness of wall permits, a highly decorative effect is produced by enriching the soffit or intradosal surface of the arch. The arches of windows on the ground-floor and first-floor of public buildings are sometimes treated in this manner, and a bold and dignified effect is obtained. Sketches 1 and 2 represent the ground-story window-arches to the Economic Assurance Company's offices, to which we referred in our last article, p. 824, in which there is a deep soffit enriched with square panels and pateræ of red terracotta, and an inner band of the same material, having a row of pateræ. . The edge-moulding below the brick voussoirs is also of red terracotta, jointed as shown; round the arch is a label of the same material. The voussoirs or arch bricks have small diamond-shaped squares of blue terracotta let in flush between every other joint, which forms an agreeable ornamentation. These arches are very effective, and are carried by shafts of marble with terracotta capitals. On the first floor there are three deeply-recessed circular-headed windows, having terracotta glazed shafts on the jambs, the outer arch members richly modelled with amorini, and clusters of fruit gracefully introduced between the label and the projecting edge moulding. A panelled soffit divides the outer arch from the inner members, which are cusped and enriched. The style of arch is the Romanesque of Northern Italy.

CONSTRUCTION.

It will be noticed that by this combination of red brick and terracotta very rich effects can be produced. The mode of jointing is indicated in our section of arch, Fig. 2. It will be observed that the edge moulding and soffit are both in terracotta, and may be cast in circular blocks to the under curve of the brick arch. In large arches with deep soffits the edge member may be formed of separate blocks, the soffit being also modelled separately. The joints of the latter may be joggled or rebated together, and should be fixed when the arch is being constructed. Great skill and care are required to properly back the brick arch to the terracotta. The blocks ought to be modelled and fired with great accuracy from full-size details, as true lines and fine joints are essential.

EXAMPLES.

One of the most important modern buildings in which terracotta has been employed in the construction of arches is that of the Science Schools for the Science and Art Department, South Kensington, designed by Major-Gen. Scott, R.E., details of which we published in the early part of 1876. The arcade on the ground floor, having arches 12ft. span facing the Exhibition-road, has deep coffered soffits of majolica fixed to an iron plate (by bolts) at the back of the brick arches. The window arches have outer rings of brick with deep moulded architraves of terracotta round the openings, eight blocks to each window, or with a centre key-stone block, the inner radius of arch being 3ft. 1½in. The outer arches of arcade are of terracotta, with moulded and enriched soffits. The majolica soffit enriched by coffers, which form the ceiling of the arcade, is thus constructed. The rough arches are of brick. At the back of these arches or vaults a plating of iron is placed, carrying the majolica slabs of soffit by means of bolts, which pass through the brick arch, and are secured by nuts above the plating. In a similar manner a number of soffit panels of terracotta can be secured — copper or galvanised iron bolts would be necessary. We recommend, however, a method of jointing and interlocking the joints as being preferable to the use of metal, and when an architect has made up his mind to have enriched terracotta soffits, we advise him to draw full-size details, and to consult with a skilful manufacturer of terracotta as to the mode of forming the blocks and jointing them. Fig. 3 represents a very effective arch of brick and terracotta at Bologna, in the House of the Caracci, forming an arched corbelling.

THE SYMBOLISM AND ICONOGRAPHY OF EARLY AND MEDIÆVAL CHRISTIAN ART.—XIII.

By GEORGE ASHDOWN AUDSLEY, F.R.I.B.A.
(Author of "Handbook of Christian Symbolism," and several works on Architecture and Art.)

IN Late Mediæval art greater freedom of treatment is found in connection with the Aureole. It is frequently formed entirely of flamboyant or straight-pointed members or rays, issuing from a centre or nucleus, and having no defining or bordering lines. In a miniature of the 16th century, in a manuscript preserved in the Bibliothèque de Sainte-Geneviève, the Virgin with the divine Child is depicted issuing from a large lily-like flower. She appears in the bright field of an oval Aureole, the edge of which is formed of numerous flamboyant and straight rays. This conveys an idea of vivid splendour. A still more beautiful and interesting example, conveying the same idea, is to be seen in the suspended figure of the Virgin and Child in the church of Kempen (Westphalia); in this instance the Aureole is, along with the entire work, executed in metal, painted and gilded. The attribute is formed of twenty-eight long rays, alternately straight and flamboyant, their points indicating the usual lenticular form. Above the Virgin, on the suspension rod, is a figure of God the Father, invested with a triangular Nimbus, and surrounded by an Aureole formed of eighteen flamboyant rays. As neither the Virgin nor the Child has the Nimbus, God alone, according to the strict rules of Christian Iconography, appears in Glory. This interesting work is engraved in Gailhabaud's "L'Architecture du Vme. au XVIIme. Siècle." Numerous examples of similar treatments are to be found in Late Mediæval art. Didron gives an illustration of the figures of the Virgin and Child, taken from 16th-century glass in the small church of Jouy, Reims. In this curious work the "Incarnate Word," depicted as a small, naked infant, is represented as if in the womb of the Virgin (conventionally, of course), invested with the tri-radiated Nimbus, and surrounded by a long, oval Aureole of flamboyant and straight rays. Speaking of another example of this peculiar treatment of the Virgin and Child, Didron remarks:—"A subject precisely like that of Jouy may be seen in a Limoges enamel now in the possession of M. l'Abbé Texier, curé of Auriat (Creuse), and corresponding member of the Committee of Arts and Monuments. The Virgin is clothed in a white robe, partly thrown back, leaving exposed an under-garment of red and gold. Upon the womb of the Virgin a little naked human being, with clasped hands, is represented within a golden Aureole. God the Father, floating on the clouds of heaven, blesses the Mother of His Son. The figure of the Virgin Mary stands out prominently from the blue background of the enamel. She is surrounded by the moon, a star, a tower, a lily, &c., all attributes commonly employed during the 15th century to distinguish her."

In the accompanying illustration, Fig. 40, we give an interesting example of an Aureole formed entirely of straight pointed rays, arranged in radiating fashion both from the body and the head. This treatment, which makes the rays cross in the neighbourhood of the Nimbus, is very uncommon, if not unique. Another novelty is to be noted in this example—namely, the manner in which the wings of the angels inclose the Glory. This illustration is taken from the stalls of the Municipal Chapel, at Siena.

Before we pass on to another section of the present subject, we must direct attention to a Greek form of the Aureole, which is evidently an extension of the triangle. This Aureole assumes the form of a star of six or twelve points, produced by either two or four superposed equilateral triangles. If the student will refer back to Fig. 23, in

Article VII., he will find an illustration of an Aureole of this star-form with twelve points. This example is taken from a Greek painting of the 15th century, and represents Christ as the "Angel of the divine Will," according to the language of the Greek Church. There is no doubt that by adopting this form of Aureole, the artist has sought to express, in the most forcible manner, that the Angel is invested with all the power and authority of the Blessed Trinity. Aureoles of this description are, however, comparatively rare in Greek art, and we are not aware of a single example obtaining in Latin art.

Up to this point we have confined our remarks chiefly to the forms and outlines of the several Aureoles introduced by Christian artists, and although we have by no means exhausted the subject, enough has probably been said to give the student of Christian Iconography a clear and fairly comprehensive view of the subject. We have now to briefly describe their surface treatments and colouring.

With the desire to clearly show the nature of the Aureole, and to express soft effulgence or vivid scintillation, artists have either covered its field with radiating lines, as in Fig. 37, or with flames or flamboyant rays, as in Fig. 30, in both cases emanating from the figure and diverging towards the edge of the Aureole. In the miniatures of illuminated manuscripts, the rays on the field of the attribute are usually of gold, highly burnished, and producing a most brilliant effect. In mural paintings and stained glass, they are either of yellow or red, the representatives of light and fire.

The colour of the field, upon which the golden or flame-coloured rays are placed, varies in different examples: the most appropriate, however, is blue, representing space, or the clear sky at noon as it appears in Southern Italy. This is the field across which the symbolical rainbow throws its arc, with its full significance, abiding ever in the full splendour of the glory of heaven.

In addition to the divergent rays, other objects are sometimes introduced in the field. In the picture of the "Last Judgment," by Fra Angelico, preserved in the Academia delle Belle Arti, at Florence, our Lord is represented invested with a rayed lenticular Aureole, upon the broad margin of which are depicted eight Seraphim. On the reverse of a medallion in bronze, struck in commemoration of a Council held by Pope Paul V. (Pietro Barbo, the Venetian, 1464—1471), is a representation of the Last Judgment, in which the Aureole of the Deity is bordered with numerous Cherubim, with their heads and wings closely and uniformly adjusted together. In the beautiful picture of the Last Judgment, by Fra Angelico, in the possession of the Earl of Dudley, the field of the Aureole is divided into three concentric divisions, the inner one, next to the figure of Christ, being, as it were, the nucleus or space of concentrated light. Around this is the second division, covered with divergent rays, and containing several Seraphim, issuing from the edge of the inner portion. The outer division acts as a border to the whole, and is entirely covered with a succession of Cherubim. Clouds, amidst which angels are flying, are placed under the feet of Christ, forming both His throne and footstool. The field of this Aureole is full indeed, and forcibly brings to the mind of the observer the overwhelming majesty of the final Judge, when He shall come, surrounded by the countless hosts of heaven, to deal justice to risen man. M. Didron, speaking of Aureoles similarly treated, says:—"A painting on wood, preserved in the church of the Abbey of Saint-Riquier, representing the Assumption, shows in the upper part of the picture, or, as it were, in heaven, the Holy Trinity preparing to receive the Virgin Mary, who is lifted up by angels and borne towards heaven. The Holy Trinity appears in the field of an Aureole, which is nearly circular in form, and has round its margin a glittering cordon of angels. The superb *Cité de Dieu*, translated by Raoul de Presles, preserved in the Bibliothèque de Sainte-Geneviève, presents several examples of similar Aureoles surrounding the Deity; these are covered in their fields with Seraphim and Cherubim of gold, flame colour, and azure."

We cannot, of course, look upon the angel forms thus introduced on the field or border of the Aureole as integral parts thereof; they are evidently intended by the artist to indicate the close relation to God of those choirs of angels whose office it is to sing His glory and love, and to proclaim His wisdom before His throne for ever. This close relation is forcibly expressed by placing the angels so near the Deity as to be inclosed in the intense radiance which immediately surrounds Him—a glory which artists have sought to intensify in their representations by rendering the angels as beings formed of light and living flame. The same idea of close relationship to God has also been expressed in art by investing certain angels with the Aureole, which is, strictly considered, the special attribute of the Deity. In the magnificent thirteenth-century glass of the south transept of Chartres Cathedral, we find the Thrones (the third choir of the angelic host) inclosed in crimson-coloured Aureoles of an elliptical form. The Thrones appear there as two great angels with green wings, and bearing sceptres. These beings express perfect rest—the everlasting stability of the throne, sceptre, and power of the Almighty.

There are other objects introduced in the field of the Aureole which appear somewhat out of place, and in connection with which the artist's intentions are rather obscure. This is the case with the candlesticks represented in the Aureole in the crypt of the cathedral of Auxerre, Fig. 38. In this work it was probably the artist's intention to represent the "seven lamps of fire burning before the throne, which are the seven Spirits of God," but on what grounds *two* candlesticks, holding fourteen lights, are introduced it is difficult to conjecture. It is obvious that there exists a considerable difference in form and general treatment between such an Aureole as that in the Auxerre crypt and those represented in Figs. 29, 30, 31, 32, and 35; and our own studies in Christian Iconography incline us to accept two leading varieties of the aureole in art, entirely different in their prime significations. Aureoles such as that at Auxerre, and those represented in Figs. 36 and 37, appear to us to express the region of heaven immediately surrounding the throne of God, rather than to be personal attributes, such as the generality of Aureoles are most certainly intended to be. In depicting Christ seated in such an Aureole as that on the Imperial Dalmatic, Fig. 36, it is quite evident that the artist had the vision of heaven in his mind; and doubtless his desire to render the full description in the Revelation was only bounded by his own powers of representation, and the difficulties of the materials in which he worked.

With the view of conveying the idea of heaven by material objects, artists have also powdered the field of the Aureole with stars and have introduced the sun and moon. On this subject, Didron remarks:—"The field of the Aureole is sometimes lighted by two stars, shining near the head of the divine personage whom it invests; one star is on the right and the other is on the left. When the Aureole is narrow, and the sitting figure has the right hand raised in the act of blessing, both stars are placed on the left, the opposite space being occupied by the hand. The entire field is occasionally, though rarely, gemmed with stars, like the sky on a clear night. The points of the stars vary in numbers from four to eight. The left-hand star is sometimes depicted with fewer points than that on the right. When such obtains, the right star is intended for the sun and the left for the moon, notwithstanding that both are similar in all other respects." In Fig. 36, the outer zone of the Aureole is richly powdered with four-pointed stars, and towards the upper part, on the right and left of the emblems of the Passion, are introduced the sun and moon, both in the shape of a crescent, with a face within its horns.

In the examples given in Figs. 29, 30, 32, and 39, and in all examples having similar treatments, the idea of personal radiance is all that the Mediæval artists intended to convey—a supernatural effulgence issuing from or surrounding the personage represented, and more or less dispersed towards the confines or localised within boundary lines, thus forming the clearly-defined attribute called the Aureole.

When seated figures of the Deity are invested with the Aureole, it is usual to find a throne or seat or a rainbow introduced in its field; and it is also usual to see something in the nature of, or fulfilling the office of, a footstool likewise introduced. In the interesting Aureole shown in Fig. 21, given in Article VII., we find Cherubim forming both the seat and footstool of our Lord. In Fig. 36 the seat is a rainbow, whilst the footstool is formed of two interlaced fiery rings, furnished with wings and studded with eyes—the wheels spoken of by the prophet Ezekiel, "full of eyes round about." Artists have used these winged and fiery wheels to represent Thrones, or the third choir of angels. In Fig. 37, both the seat and footstool are in the form of narrow-arched members or bows.

The field of the Aureole is very frequently devoid of any ornamentation or insertion, being perfectly plain gold or colour margined with simple lines, a narrow border, or a band bearing an inscription. The Aureole of the Agnus Dei, in the miniature of the Triumph of the Lamb, in the evangeliarium of Charles the Bald, is surrounded with an inscribed border; but the usual chalice is introduced in the plain field, and the Lamb stands upon an open scroll. In another fine page of the same manuscript, representing Christ in Glory, surrounded by the portraitures and symbols of the four Evangelists and the portraitures of the four great Prophets, the Aureole of our Lord is surrounded with a border bearing the inscription: XPS . VITA . HOMINUM . CAELORUM . GLORIA . SUMMA . LIBRAT . TETRAGONUM . MIRO . DISCRIMINE . MUNDUM. In this case the field within the border has several concentric lines or bands of colour, and our Lord is seated and rests His feet upon a circular disc with a fringed edge. This may be intended to represent a circular cushion or carpet, placed before the throne, which is not shown or indicated in any way in the miniature, being hidden by the drapery of the figure.

In respect to colour treatment, as might be expected, the Aureole differs but little from the lesser attribute, the Nimbus, as applied to portraitures of the Deity. Similar ideas are sought to be expressed and conveyed by artists in both the attributes, and, accordingly, the same range of colours is employed. The colours which have been considered the most appropriate, however, are those which most forcibly represent fire, light, and space—namely, red, yellow, white, and azure. A summer day, with its clear expanse of blue sky and vivid sunbeams, has furnished artists with the most appropriate suggestion for the colouring of an Aureole indicative of celestial brightness; but artists have often sought to go beyond natural phenomena as sources of inspiration, and in their own fertile imaginations have essayed to express supernatural radiance and glory.

Didron, in speaking on this subject generally, remarks:—"Both the Nimbus and the Aureole being a luminous efflorescence of the head and of the body, its colouring in sculptured and painted monuments should be that of light itself. Accordingly, we should expect to find this to be the case in mosaics, frescoes, painted glass, miniatures of manuscripts, and storied tapestries. But light is ever varying in its colours; like water, it becomes tinged with divers colours, according to those of the different objects which reflect it, or its own proper intensity. The stars, sources of the most vivid light, emit scintillations of blue, violet, red, and white. . . . Light, decomposed by the prism, divides itself into seven principal elements, which, in combination, form an infinite number of tints or *nuances*. The glory, possessing the properties of light, will consequently vary like it in colour from a deep blue to the most vivid white. Accordingly the Aureole and the Nimbus are sometimes coloured blue, violet, red, yellow, or white. But at all times, yellow, the colour of gold, has been esteemed the most precious, the most noble, and the most brilliant of all colours: gold, of which it is the type, being considered as light solidified. On this account the Nimbi and Aureoles, especially those of the Deity, are most frequently of gold or a yellow colour. Hence representations of the sun, whether ancient or modern, are usually of a yellow colour, red only being adopted with some particular intention. Homer speaks of Apollo as having hair of gold; and Phœbus, the blonde and the golden, is quite as great a favourite as the blonde or golden Ceres."

Notwithstanding the above facts, we think there can be little doubt that, as in the case of the Nimbus, the colouring of the Aureole is occasionally symbolical. When we bear in mind that the colour red signifies divine love, power, and royal dignity; that blue is emblematical of heaven, and signifies godliness, and divine contemplation; that pure yellow or gold signifies intense brightness and the goodness of God; and that white or silver signifies light unsullied, purity, joy, and life, it is not difficult to realise that all such colours may be, and probably very often were, used in connection with the divine attribute under consideration, with a direct and highly appropriate symbolical signification.

The few remarks above given with reference to the general artistic treatment and the colouring of the Aureole will be sufficient guides for the practical student of Christian Iconography and for the modern ecclesiastical artist. In our next article we shall conclude this branch of our general subject with remarks on the application of the Aureole.

(*To be continued.*)

"BUILDING NEWS" DESIGNING CLUB.

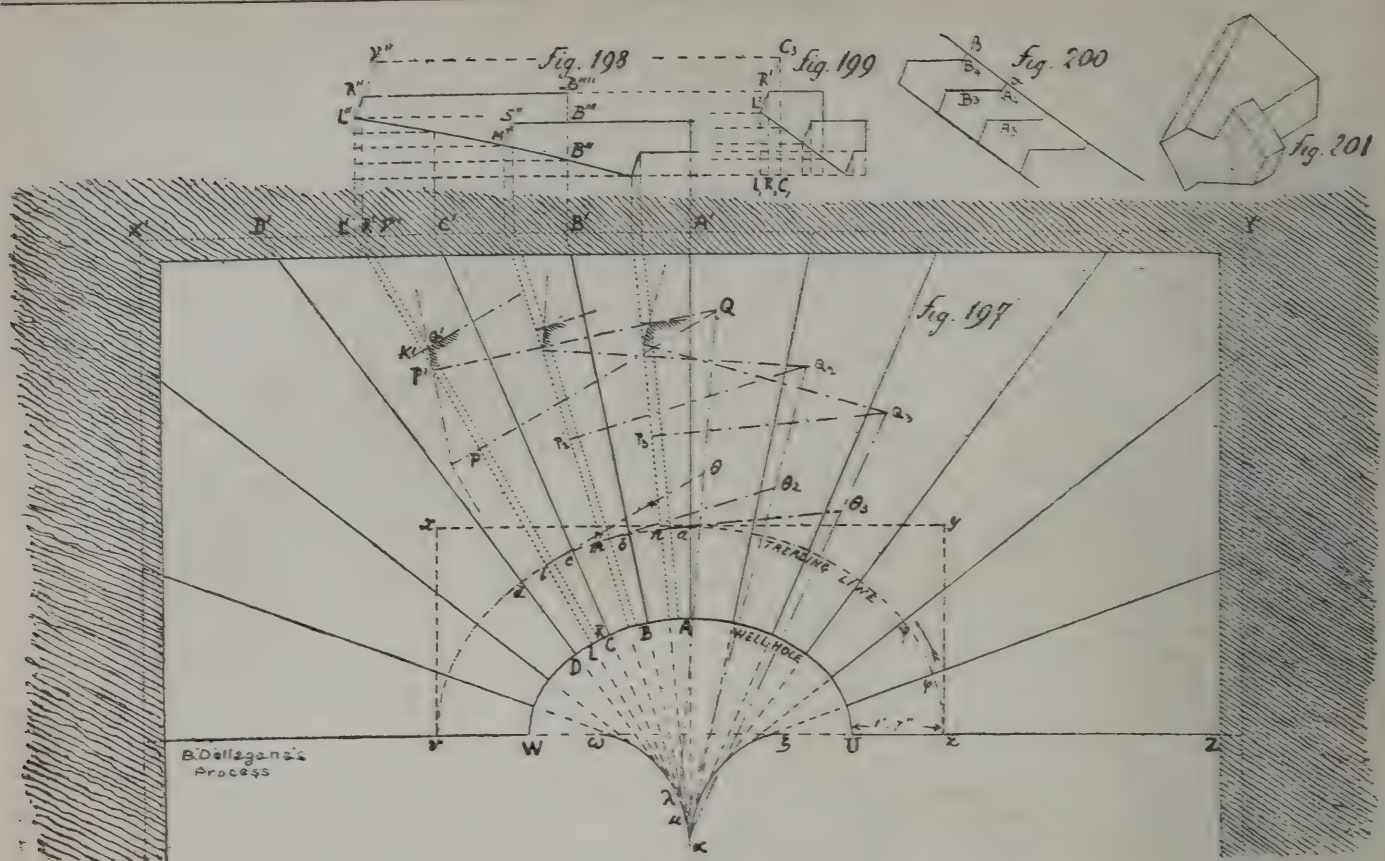
A PARISH HALL AND SOUP KITCHEN.

WE publish to-day the two chosen designs for this subject—the last of the series for 1889—90. The conditions issued for competitors to work to were as follows. Subject H.—A parish hall and soup kitchen, to be erected on a corner site with a side frontage of 125ft. deep, and a frontage of 35ft. to the main road of a small village. The best-sized room obtainable on the site to be provided, allowing for a good roomy stage with a retiring-room, suitable for class and committee purposes, or as a green-room for theatrical performances. These parts of the hall to have a rear entrance, and the soup kitchen may be in a half-basement. Provide good main entrance, lobby, and stairs to gallery at end of the hall only. The floor of the stage is to be 3ft. above the level of the hall, and to have an arched opening dividing off the wings from the assembly room. Hall to be heated by hot-water coils in recesses in walls. Style, Late Tudor Renaissance, in stone, and roofs covered with green slates. Provide for ventilation. Scale, $\frac{1}{8}$in. to foot. Sufficient drawings to show design, including sketch view.

The selected design is by "Wallaby," "Red Rover" comes second, and the third place we give to "Fiddler"—three competitors who before have run neck-a-neck in the race for priority. Again we have to admit that neither of the competitors realises quite what we intended, or rather, each fails to grasp the requirements of the conditions. Either their entrances are inadequate and poor, or the retiring-room accommodations and stage are inadequate for theatrical performances. Thus "Wallaby," though giving a good green-room, makes his w.c. and lavatory arrangements excessively small, with no proper place for ladies' use. The doors on the stage are properly placed, and room for flies is provided. The soup-kitchen would be dark, and the entrance for the public to the waiting-room is awkward to a degree, at the foot of the stairs. There should really be one way in and another way out in so small a place. The design externally is suitable and pretty, but the low ceiling to the big hall is a great mistake, wasting valuable air-space, to say nothing about good proportions. The gallery would be very hot. Honeyman ventilators may be all very well, but cubical contents are of primary importance. Mr. Butterfield's rule in designing a church is that the air-space should be equal to the requirements of the intended congregation for the period of a full service without aid from changing the air during that time. There can be no object in shutting off the available space afforded by a high roof as "Wallaby" has done. The accommodation for housing scenery at the rear of the stage above the retiring rooms is a necessary provision. "Wallaby" has improved, and we commend his industry and care. "Red Rover" deserves the same praise, and while we have never hesitated to condemn the faults of his designs, the justice of which criticism he will admit, we have always acknowledged with equal care his good points. This has been our endeavour with all the designs so far as space at our disposal would permit, but the large number of competitors has often precluded us from naming more than a few in precise detail. "Red Rover's" stage is bad. The stairs up to it cut into the space, and prevent side scenes being used, leaving no room for players to "go off" properly. Then the door in the middle at the back of the stage is exactly where it should not be. See how the depth of the platform is spoiled, and the actors always having to retire from the centre of the scene. Separate conveniences are contrived for the two sexes, and the separate doors for soup-kitchen and stage are an advantage, though not necessary for such a building. The soup-kitchen in this plan is much better than in the first design. The entrance to the hall is not so roomy, but the ticket-place or office would serve also as a cloak-room. The external door to it is not required, and the space it takes would have been better devoted to a more ample main doorway, making it less in the corner. The external design has good points about it, though the front façade is patchy and lacking in "go." "Red Rover" draws more carefully than he did. "Fiddler" does not improve to the extent we had hoped for. His Parish Hall design is not up to his earlier efforts, and his drawings are careless, that is to say, his perspectives are. He is more correct in style to the period of Late Tudor Renaissance than the first two designers, and he seems to know old work with advantage, even to the weakness of imitating the false conceits at times to be noted in historic buildings. The covered balcony, surmounted by a pediment over the portico, is useless with no doorway into it, and the blank window on the left-hand to balance the window of the cloak-room on the right is a poor expedient in good work. Filled-in arches never intended to be open ones in two bays of the flanks are a mistake, and seem to aim at the idea of an old market shelter, bricked up. The side door would be a nuisance during performances, when those outside could create a disturbance, while on the occasions of political and excited gatherings the results of such a doorway might easily be serious. The steps at the other door, too, are objectionable. The stage is shown level with the floor of the hall—that is to say, no steps up to it are shown on the plan. The greenroom is half as big again as the stage. The public space to the soup-kitchen is too small, and the soup-kitchen is too big. The hipped end of the hall roof ill accords with the somewhat over-elaborated gable at the other end, standing, as it does, like a masking screen to the façade. "Fiddler" should learn the elements of sciography, for his shadows as here put in bear no reference to the projections from which they are cast. "S. A. H." (Stockport) crowds his entrance into the corner under an angle open porch, and he cramps his staircase into the other corner facing the front doorway. To reach his soup-kitchen, he presumes that the ground along the flank façade falls rapidly. This also allows him to contrive prettily an external staircase up to the stage and retiring-room. The stage is a good one, roomy and ample. The architecture has the merit of being simple; but it is poor in idea, and the pepper-boxes, which do duty as ventilators, serve to over-emphasize the semicircular arch form introduced everywhere in the composition. "Y" in a circle sends us a design which is greatly over-wrought and fussed up with nondescript detail, so much in fashion with Non-conformist chapel builders some twenty years ago. We condemn the style without reserve, but we recognise cleverness and thought in "Y.'s" plan. The w.c. between the gallery stairs and the entrance vestibule is too publicly placed, and might become a nuisance. The ticket-office and cloak-room would be useful, and the soup-kitchen arrangements are very good indeed. The drawings show ability, and their author should really study works of a better style. "Pisistratus" sends a commonplace design with a half-timbered tower surmounting the staircase to the gallery. The stage is too shallow, being only 12ft. deep. "Clansman" is more Scotch in style than anything, making a design which looks like a police-station somehow, though it lacks character; notwithstanding this, his plans are carefully drawn. "Coombe" believes in flint snap work and bastard Late Gothic having wide Tudor arches and no tracery or mullions. This is not Renaissance work; and as for his interior of the hall, who shall describe it? The style has but little reference to the exterior. The plan is a practical one, though it is presumed that a long jump will be taken by those wishing to reach the stage from the hall, no stairs or room for steps being indicated. "Renaissance" favours us with a tower to mark the angle of his design, but it is as uncalled for as it is ugly, riding over the gallery doorway and window to the main entrance lobby. The great projecting oriel bay window, too, at the other end out of the committee-room (which is only 31ft. by 22ft.) is another piece of extravagance quite out of keeping with such a building, towering its assertive bulk into the street above the modest soup-kitchen in the basement. When used as a greenroom, the author says this apartment can be divided by a screen into two; but the second half in that case would be totally dark, as there are no other windows beyond the aforesaid big bay. "Syak" sends an incomplete drawing with a front more like a schoolhouse, and a fairly good place; but the design is wanting in interest. "Dot" makes his building like a great Classic "meeting-house," or it might be a corn-market. The soup-kitchen is as big as the hall over it. His drawings are neatly done, but the perspective is unfinished and unfortunate in effect. The other designs are by "Menelaus," "S. C. D.," "Sector," and "Box." The awards of the prizes in connection with our Designing Club will be published in the autumn.

MASONRY AND STONE-CUTTING.*

By LAWRENCE HARVEY.



[THIRTIETH LESSON.]

GEOMETRICAL STAIRS.

A MAN'S step is about 25in. on the level and 12½in. going up a ladder. By combining these two facts, we get the formula T + 2R = 25in., in which T = tread, R = riser, as the basis for finding the proper proportions of tread to riser. If T = 12, then R = 6½; if T = 9, then R = 8, &c. But R can only vary between the limits of 4½in. and 8in.

Stairs may be formed of straight flights, the steps supported by a wall at both ends, or the steps supported by a vault; or the steps may be housed in the wall at one end and left free at the other end, leaving in the centre of the staircase an open well-hole. In that case the steps are

* All rights reserved.

made to rest upon one another by joggled joints, such as M″ S″ B‴ (Fig. 198). The joint on the lower step is called a back-rebate, and in the upper step a bird's-mouth. If the well-hole be curvilinear, as in Fig. 197, the stairs are called geometrical.

In geometrical stairs the widths of the steps vary from one end to the other; but the proportions of treads to risers are fixed on a line parallel to the well-hole at a distance of 1ft. 7in. from it. This is called the *treading-line*, on which all the treads must be equal.

To draw the plan (Fig. 197), take z U = length of the shortest step; deduct therefrom U z = 1ft. 7in., and draw the rectangle $z\,y\,x\,v$, of which the sides are equidistant from the walls; inscribe in this rectangle a semi-ellipse, and this will be the treading-line of the stairs. If the outside walls formed an irregular polygon, the treading-line might be drawn with centres so as to form a continuous curve. Divide the treading-line in n equal parts = to the widths of the treads, $z\varphi = \varphi\psi = \ldots = ab = bc = cd = \ldots$, which gives n + 1 risers from z to v. If the number of steps be not sufficient, the proportions of the treads and risers may be made stiffer, or the steps themselves may be made shorter so as to extend the treading-line.

Then draw normals to the curve $v\,a\,z$ through the points of division found, and through their mid-points l, m, n, . . . The intersections of these normals will form a polygon, the enveloping curve ($\omega\lambda\mu\alpha\zeta$) of which is the involute of the treading-line. On every one of these normals carry 1ft. 7in., and you can get the curve U A B C D W as well-hole. The normals A A′, B B′, C C′ . . . are the projections of the arrises of the steps.

Now, if on the vertical cylinder $z\,a\,b\,c\,d$ . . . we draw a helix—that is, a curve on which the co-ordinates of every point counted on the base line have the constant proportion of tread and riser, z will be at a level = R and every other point of division at the same height, R, above the former. If a horizontal line moves along that helix, remaining at the same time tangent to a vertical cylinder on the involute $\omega\lambda\alpha\zeta$, then it will describe a surface which will touch the arrises of all the steps; this is the extrados of the stairs, and it is a skew-surface.

The soffit of the stairs is a surface identical with the former, but lowered uniformly of a certain distance δ, which we shall determine later on. The joint lines of the soffit are projected on the normals to the treading line drawn through the mid-points l, m, n, . . . ; one of the steps, for instance, will stretch between the lines B B′ and L L′. So that the surface of the joint be everywhere normal to the soffit, the correct way is to erect normals in two points of the joint, then divide these normals in equal parts, and work the surface by means of a straight-edge placed on these points of division. The surface is then a hyperbolic-paraboloid. Notwithstanding this terrible name, it is a very easy operation to accomplish when the well-hole and the walls are circular, and Mr. Wornell, the foreman of masons at Messrs. Nightingale's, Lambeth, always produces the joints of his stairs on that principle. In our present case, it would involve making two separate bevels for each step; besides which the construction of the normals is more difficult than in circular stairs. We therefore let the joint be a plane taken through the arris L L′ of the joint and the normal to the surface in P, mid-point of L L′.

To construct that normal, we must find the plane tangent in P, which is done by substituting a connecting paraboloid to the surface of the soffit. To draw the connecting paraboloid, produce $l\theta$ tangent to the helix, and let it meet a horizontal plane at the level of 3 steps below, in which case $l\theta$ = 3 treads. As the joint line l L touches a vertical in λ, if a horizontal line be made to move in contact with $l\theta$ and the vertical λ, it will produce the connecting paraboloid required.

Now, to find the plane tangent to the soffit in P, draw $\lambda\,\theta$ generator of the connecting paraboloid, and cut $\lambda\theta$ and λl by a vertical plane, P Q. The line which joins in space the points P and Q is another generator of the paraboloid; the plane tangent to the soffit in P contains that line P Q, and the joint line L L′. Turn down the plane P Q round its trace; P′ is at the level of 3 risers above P, draw P′ Q and produce P′ G′ at right angles with it; that is the normal required through which the plane of the joint must be taken. At about 2in. above the point P draw K′ G′, the upper level of the step. Now we can settle the height B‴ B‴′ (Fig. 198), which we called δ. The arc $l\,m\,b$ = $\frac{3}{2}$ of width of tread, therefore the point l is $\frac{3}{2}$ riser above the point b. Adding this difference of level to the height P′ K′, we have δ = P′ K′ + $\frac{3}{2}$ riser. Therefore it follows that the height P′ K′ is constant for all the steps. The construction of the normal at the mid-point has to be made for every step independently, for its angle varies with each step.

Face Moulds.—The face, which is housed in the wall, is the intersection of the vertical plane X′ Y′, with the surfaces of the steps as shown in Fig. 198. The soffit is a curve, of which several points are found by the intersection of generators of the soffit. If a nosing is put to the steps, it must be added on the mould. The face which forms the well-hole (Fig. 199) is a cylindrical surface, and must be developed. Mind the joint line is curved. To find a third point of that curve draw a horizontal generator of the plane of the joint, say $c\,\gamma'$ on plan, find its level γ, by which get C_3 above C_1 (Fig. 199); then draw the curve.

Cutting of the Steps.—Select a stone which will contain the step; work the tread, draw thereon the outline B B′ R′ R, then with a square work the riser, the wall-face, and the well-hole. Draw the face moulds in their respective positions, and work the joints, both rebate at the back and bird's-mouth in front. Through guiding marks work the soffit of the stone with a straight edge.

Sometimes (Figs. 200, 201) a piece $\beta\,B_4\,B_3\,A_3\,\alpha$, is left on along the well-hole to form a string about 4in. or 5in. wide upon which to fix the balustrade. In Fig. 201 is rather an exaggerated view of a step finished in this way. When the off-set $\beta\,B_4$ is less than 2in., it need not entail any sensible waste of stone; but sometimes the string is built separately, and the steps are housed in it, as we shall see in our next lesson.

BOOKS RECEIVED.

Public Libraries, by THOMAS GREENWOOD, F.R.G.S., third edition (London: Simpkin, Marshall, Hamilton, Kent and Co.), is an entirely rewritten account of the Public Library movement. In the introduction the author enumerates the great libraries of the Continent and the United States, and sketches the progress made under the Public Libraries Acts. Mr. Greenwood's book not only describes the progress made, but the buildings that have been erected, illustrating many of them by plans and exterior views. The subject of local taxation as it bears on the question is discussed, and the unequal rating, the bulk of which falls upon the occupier. We agree with the author that a Minister of Public Instruction is of the first importance if we are to keep pace with other Governments. The passing of the Ewart Bill of 1850 forms the subject of a chapter, a good portrait being given of that gentleman. Manchester was one of the first places to take advantage of the Act. A very instructive chapter follows, describing the mode of adopting

the Acts, and the steps to be taken by boroughs, districts, and parishes, including the legal forms necessary in carrying out the provisions. Descriptions follow of public libraries in the northern counties, and the libraries at Barnsley, Barrow-in-Furness, Blackburn, Bolton, Bootle, Darlington, Dewsbury, Leeds, Liverpool, Manchester, Middlesbrough, Newcastle, Preston, Sheffield, Wigan, and other towns are minutely described and illustrated. The Midlands include descriptions of buildings at Bedford, Birmingham, Derby, Leicester, and several other towns. The public libraries in the Eastern Counties include those built at Great Yarmouth, Ipswich, Norwich, Brighton, Reading, Southampton, and other places. Mr. J. Passmore Edwards gave a thousand volumes to the last named town. Bristol, Cheltenham, Exeter, Newport, Plymouth, Salisbury, and Truro are described in connection with the movement. The libraries in Scotland, Ireland, and Wales, including the recently-opened Edinburgh library, follow. Not the least valuable part of the work is the account of the development of the Acts in London. Descriptions and illustrations are given of the libraries at Westminster, Lambeth, Battersea, Chelsea, Kensington, Clapham, Clerkenwell, and the extension of the movement at Deptford, Hampstead, Islington, and Newington. The villages and rural districts, the legal aspects, the formation of libraries, details of fittings and administration, and a sketch of the movement in America and Canada, in addition to various miscellaneous matters connected with the working of libraries, form other chapters. The book is useful to all promoters, architects, and others.—*The Turkish Bath; its Design and Construction*, by R. Owen Allsop, Architect (London: E. and F. N. Spon), is a reprint in a new form of the articles that have appeared in the Building News. The author's work, as it now stands, is a very useful guide to the design and construction of this description of bath, and will be a welcome addition to the shelves of the architect's library. The requirements, principles of plan, and construction of public baths are clearly laid down in a concise manner; the author's experience has enabled him to point out the essentials necessary to be kept in view. Mr. Allsop's treatise is one on a special branch of architectural design very little understood by the profession, and it is therefore likely to command attention. The provision of Turkish baths is sadly out of proportion to their need in all large towns, and one day, probably, sanitary authorities will become alive to the fact. Those already erected pay well, and there is obviously an increasing demand for well-arranged baths of this kind. Both public and private baths are discussed, and the work is well illustrated by places and diagrams. It is unnecessary to enter into the subject of the work, already known to many of our readers who have perused the articles. Rightly, the requirements of a public bath are followed by a description of the plans of some of the best London structures of this class, including the Turkish baths, Savoy Hill, those erected by Mr. Robert Walker in the Northumberland-avenue, the Euston-road baths. The details occupy a large portion of the work, careful attention being bestowed on the design of the hot and cooling rooms, washing and shampooing rooms, douche-room, plunge-bath, dressing and other apartments, the important auxiliaries of heating and ventilation. The engineering appliances and other details receive also their proper share of attention, and the designs given for small private baths in connection with ordinary house arrangements are valuable. The architect will find all the information he requires in the pages of Mr. Allsop's work.

BUNGALOW, DOUGLAS, ISLE OF MAN.

THIS Bungalow is to be erected in the Isle of Man, near the sea. The walling is built of large cobble stones from the beach, and the upper part is plastered. The curb roof has been adopted, as, besides permitting a picturesque treatment of the exterior, it affords the maximum amount of space for bedroom in the roof. The roof is covered with red tiles, and the woodwork is painted white. There are four bedrooms and a bath-room on the first floor.

M. H. B. Scott, Architect.

Douglas, Isle of Man.

THE SOCIETY OF ARCHITECTS' AUTUMN EXCURSION, 1890.

THE Council of the Society of Architects have decided that the Society's Excursion for the members and their friends should take place this year during the last week in August, in the county of Kent, which is so rich in beautiful objects of interest to the architect.

A programme is in course of arrangement with the secretary of the Kent Archæological Society, and special facilities are expected to be afforded for visiting places which are not usually available for inspection.

Rochester will probably be the rallying point on the 25th August, with Maidstone, Tunbridge, and Canterbury as centres, taking in during the week the many buildings in and around and situated along the route from point to point, finishing up with a drive from Faversham, *viâ* Sittingbourne, back to Rochester.

As soon as the places to be visited are fixed upon, and the programme completed, with full information as to the stopping and sleeping places, it will be issued to those who may desire to join.

We are informed by the Council that the office of secretary to the Society will become vacant shortly, and that an advertisement stating the terms under which the vacancy will be filled will appear in the *Times* and the Building News in the course of a few weeks.

CHIPS.

At a meeting of the council of King's College, London, on Friday last, Mr. David S. Capper, M.A., Assoc.M.Inst.C.E., was elected to the Professorship of Mechanical Engineering at the College.

The death sentence on Thomas Harding, the builder in Kentish-town who recently murdered a barmaid, has been commuted to penal servitude for life.

The longest tunnel in connection with the Manchester Waterworks scheme—the Raise tunnel—which extends from near Townhead, Grasmere, to the straining well at Thirlmere, and is 5,225 yards long, has been completed, so far as the boring is concerned. The tunnel has been in course of construction nearly four years.

The contract for erecting the new chancel of St. John's Church, Heaton Mersey, has been let this week for £1,399.

At a meeting of the sub-Corporate Property Committee of the Leeds Corporation, held on Friday, Mr. J. T. Micklethwaite, F.S.A., F.R.I.B.A., of Westminster, who had been called in to advise the committee respecting the restoration of Kirkstall Abbey, reported that he had visited the abbey and would issue his report in about ten days. He thoroughly approves of the action of the committee with respect to the stripping of the ivy off the walls of the abbey and taking down trees.

A memorial has just been erected in the North-west Chapel of St. Paul's Cathedral to the memory of the late Mr. John Howell and Mrs. Howell. The principal feature is a panel containing a head of Christ, crowned with thorns, sculptured in relief. The sculpture was executed by Cauer, of Kreuznacht, and the other parts by Messrs. Farmer and Brindley, of Westminster Bridge-road.

CONTEMPORARY BRITISH ARCHITECTS.

(SEE description on p. 93.)

ABERDEEN PUBLIC LIBRARY.

THIS is the selected design, by Mr. Alexander Brown, Aberdeen, which obtained the first place in the recent competition. The cost of the buildings, exclusive of internal fittings, is estimated at £7,500. The site is on the north side of Rosemount Viaduct, adjoining the Wallace statue, and overlooking the public gardens in Union-terrace. The building consists of three floors. The ground floor contains the reading-room, store rooms, unpacking room, and janitor's house. The lending library, committee room, &c., occupy the first floor, and the reference library is on the second floor. The walls are to be built of granite from the quarries in the neighbourhood, and the roofs are to be covered with green slates. The two main floors are to be fireproof, and building operations are to be commenced at once.

"BUILDING NEWS" DESIGNING CLUB: DESIGN FOR PARISH HALL AND SOUP KITCHEN.

(FOR description, see page 69.)

THE BREWERY HOUSE, BATTLE.

THE necessity of rebuilding the Brewery House, which is situate in a good position in the High-street within view of the Abbey, has induced the owners to permit the architect some liberty with the design, which has been prepared in harmony with the half-timber work so frequently met with in the Sussex towns and villages; a very interesting example may still be seen in the "Old Abbots' Hospital," adjoining the Abbey entrance; the introduction of half-timber will not, therefore, be out of place in the picturesque town. In the general construction the walls will be in local red-facings with Bath stone dressings, the upper stories being timber-framed in oak with rough coat, the rear being mostly tile hung, and the roofs covered with brindled tiles. Internally the work will accord with the design, the dining-room, hall, staircase, and office having ceilings framed with wrought timbers, the old wall panelling being adopted as a high dado with cornice and frieze in the hall. The accommodation will comprise two excellent sitting rooms, open staircase with private entrance, kitchen, and offices in the rear, the brewery office occupying its former position next the yard entrance; on the first floor are four bed rooms, bath-room, &c., and in the attics three good rooms. The architect is Mr. Philip Henry Tree, of St. Leonard's-on-Sea.

CAMPANILE, HOLY TRINITY CHURCH, GOSPORT.

THIS illustration, taken from the drawing now on view in the Royal Academy Exhibition, represents the new tower to this church from the designs of Sir Arthur Blomfield, A.R.A. It is reproduced from a signed perspective by Mr. Arthur C. Blomfield, M.A. The Campanile is chiefly in brick, with stone sparingly used, and a conical spire surmounts the whole.

SCULPTURE FROM THE SALON, 1890.

THE first statue, by M. A. Duverger, of 9, Rue de Chatelier, Paris, represents the "Enigma of Nature"—"O Muette Isis! Nature Impénétrable." Here the youth, typical of the true in all ages, cries for more light, and, like many aspiring souls of all ages, seeks knowledge from a source whence it can never come. The second group is "Premier Artiste—Age de la Pierre Faillée," by M. P. Richer, also of Paris. The keen natural interest of the primeval artist in the carved creation of his own hand is well realised in this statue, as this old sculptor of the Stone Age critically examines the little elephant which is now receiving his finishing touch.

HARDWICK HALL.*

THE accompanying drawing by Mr. A. E. King, of Mansfield, is a representation of the door from the landing to the council chamber in Hardwick Hall, Derbyshire, the seat of the Marquis of Hartington. The whole of the work is in oak, the panels are bolection moulded, and the pilasters enriched; the style is Elizabethan. The Lock (of which a detail is given) is an excellent specimen of the metal worker's art; the door is hung by four wrought band hinges of a substantial character.

ROYAL ACADEMY ADMISSIONS, JULY, 1890.

STUDENTS, UPPER SCHOOL.—W. A. Fenn, W. C. Howgate, A. M. Poynter, W. J. W. Roome, F. E. Smee.
STUDENTS, LOWER SCHOOL.—H. P. Adams, W. E. Barry, J. Begg, J. Borrowman, A. W. Cleaver, C. Evans, D. B. Niven, A. Dunbar Smith, D. C. Veazey, H. H. Wigglesworth.
PROBATIONERS.—H. W. Bird, J. G. Charlton, H. C. Corlette, E. E. Jordan, G. W. Marshall, P. G. Newton, G. F. Wilkinson.

CHIPS.

The Dundee Water Commissioners have instructed Mr. Watson, the water engineer, to prepare Parliamentary plans for new works, estimated to cost £47,000.

In Tuesday's list of receiving orders in the *Gazette* the names appear of George Pluckrose, Ravenscourt-gardens, Hammersmith, and Henry Oldrey, Castelnau-cottages, Barnes (trading as William Oldrey and Co.), Carlton-bridge, Westbourne-park, and Bosworth-road, and Cowley Wharf, Kensal-road, builders and contractors.

The Metropolitan Management Amendment Act (1862) Amendment Bill, which is intended to place the law relating to the flagging of footways upon the same footing as that relating to the permanent roadways, was read a second time in the House of Lords.

The new offices for the Edison and Swan United Electric Light Company (Limited), London, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

The French Senate has adopted by 188 votes to 19 the Bill for preserving and maintaining the exhibition buildings in the Champ de Mars.

New cycle works for Messrs. Taylor, Cooper, and Bednell have been erected at Coventry, and special attention has been paid to the ventilation, which is carried out on the Boyle system.

A new boys' school, added to the existing parish day schools of the Church of St. Simon, Baptist Mills, Bristol, was opened on Monday. The total cost will be £1,000. The school is built of Pennant stone, with freestone dressings, having a length of some 75ft. and a breadth of about 23ft. Leading out of the main school is a large classroom, 24ft. by 24ft. The flooring is of wood blocks laid on concrete. Mr. E. Henry Edwards was the architect, and Mr. John Perkins the builder.

The executive committee of the Lord Napier of Magdala Memorial Fund have reversed their previous decision that on the equestrian statue about to be erected in Whitehall-place the figure of the late Field-Marshal should be without a helmet. Sir Edgar Boehm, R.A., the sculptor, had submitted two models, one with and the other without a helmet, and the former has now been unanimously approved.

* We gave views of Hardwick Hall August 17, 1888, with descriptions.

COMPETITIONS.

CAMBERWELL PUBLIC BATHS, EAST DULWICH.—In this competition, Mr. Charles Barry, F.S.A., was appointed professional assessor to the Commissioners, and the following is an abstract of the report he has made as to the designs sent in:—Seven designs were received, and six of the competitors have sent in perspective drawings. Several designs show much ingenuity in the arrangement of plan so as to meet all the requirements in the instructions. The referee studied the designs with special regard to the following particulars:—As to arrangements of the plan, as to adequate lighting and ventilation, as to sanitary arrangements, as to the scheme and arrangement for warming the swimming baths and private baths, as to the architectural design outside and inside. He recommends for acceptance the plans sent in by Messrs. Spalding and Cross, 15, Queen-street, Cheapside, which are, Mr. Barry says, "most convenient, economically arranged, well lighted and ventilated, and as to which the greatest pains has been taken by the authors to make the warming arrangements as complete and effective as possible, and with economy in working. Messrs. Spalding and Cross have taken far more pains with this subject (so vitally important in respect of public baths), than has any other competitor. They have indeed given elaborate details of two methods of heating, to which, if their design is adopted, the careful consideration of the commissioners should be given. Their design for the entrance front, although evincing much architectural ability, is however hardly sufficiently indicative of a public building, and if they be appointed architects, they should be called upon to re-consider it in this respect. It is represented in a cleverly drawn perspective in sepia only, but the materials proposed are red brick and red Mansfield stone dressings, which would produce a good effect. By very clever arrangements, Messrs. Spalding and Cross have contrived to get not only the large swimming baths, but also *all* the private baths for both sexes, and of both classes, on the same level, the advantage of which is obvious, and only in two other of the designs sent in has this been done. A good entrance is given for each sex placed on either side of a central pay office, with ticket hatches on each side, for the several classes, and for each class of private baths convenient waiting rooms are provided. The cube contents of their design are estimated at 593,072ft. and their estimate is £14,225, or at the rate of 5¾d. a foot. The cube I find practically correct; but I doubt whether a rate of 5¾d. will be found enough, although like establishments have been completed at a cost within that rate, and Messrs. Spalding and Cross express their willingness to undertake to obtain a tender from a trustworthy contractor within their estimate, and refer to the public baths lately erected at Hampstead from their designs in confirmation of this. In all cases the competitors have sufficiently complied with the instructions issued to entitle each to the honorarium of 20 guineas offered by the Commissioners." The Commissioners have, after examining the whole of the designs sent in, unanimously adopted the report of Mr. Charles Barry, and selected the design of Messrs. Spalding and Cross, subject to alterations which may be suggested by Mr. Barry, and to their obtaining a tender from a trustworthy contractor within their estimate, and the sanction of the Local Government Board. The sum of £16,000 required for the erection of these baths will include architect's fees, quantity surveyor, interest, and other contingent expenses.

A special meeting of the brethren of the Incorporation of the Guildry of Edinburgh was held on Monday for the purpose of electing an interim Dean in room of the late Sir James Gowans. There were three candidates for the office—viz., Mr. W. Allan Carter, C.E., Councillor Robert Miller, and Mr. Robert Shillinglaw, builder. A great amount of interest has been taken in the election, and some keen canvassing has been carried on by the supporters of the different candidates. Mr. Miller, who was nominated by Mr. Livingston and Mr. W. Wybrow Robertson, A.R.I.B.A., of H.M. Office of Works, was elected, the numbers being: Miller, 417; Carter, 250; Shillinglaw, 168.

A male infirmary and lavatory block are about to be added to the Joint Counties Lunatic Asylum at Abergavenny. Mr. Alfred Swash, of Newport, Mon., is the architect, and the tender of Mr. J. Linton, of the latter town, has been accepted for carrying out the contract at £3,300.

WAYSIDE NOTES.

PROMINENT among the Metropolitan improvements proposed to be carried out by the County Council is the extension of the Chelsea embankment, at the estimated cost of £62,000. The realisation of this scheme would seem to depend upon the attitude of the Chelsea Vestry. The Vestry has agreed to contribute only £8,000 of the cost of the improvement, and as it is thought that a moiety of the estimated outlay on the works should be paid by the Vestry, matters may be delayed or come to a deadlock unless the two corporate bodies arrive at an understanding. It would be a pity if this were the end of the scheme, as the improvements would be very real and evident, if, as proposed, some acres of foul mud-banks between Battersea Bridge and the Tremorne Tap be reclaimed, and two tidal baths be constructed between the new embankment walk and the Cheyne walk. I do not comprehend exactly who is to erect the baths, lay out the gardens, and do the odd jobs in connection with the improvements; but I do think that if the County Council are going to carry out these works, they will be doing more than they need trouble themselves about whilst there are a few thousands of architects in London with spare time on their hands. If the Council construct the embankment, fill in the waste land formed by the inclosure of the unsavoury mud-banks and foreshore, and generally level over, they will be doing as much as the ratepayers expect. The architects might then get a little occupation, if not actual commissions, from the Chelsea vestry, I think that august body would inaugurate a competition for the proposed baths, gardens, &c.

Chelsea will want some sort of compensation, as appears quite probable, the famed "Physic Garden" is to disappear. It is said that Lord Cadogan desires to possess the site of this garden for building purposes. The Apothecaries' Company, who hold the ground, by gift from Sir Hans Sloane, in 1721, have, like the owner of the Arabian steed, been tempted with much gold; and it remains to be seen whether, like the Bedouin, the Company is in the end proof against the temptation. Of itself, it would doubtless accumb; but as it is likely that outside pressure and influence will be brought to bear upon it, the garden may yet remain open to the public instead of becoming covered with buildings, though it may be only through the generosity of individuals or institutions who would buy over Lord Cadogan's head, that the garden can be saved.

General Pitt Rivers writes to the *Times* of the 15th in the matter of the preservation of Bristol Antiquities. The general regrets that the few existing ancient monuments in the British Isles are neglected by their owners, who fail to take advantage of the Ancient Monuments Act. It would appear to an independent observer, however, that these advantages cannot be very pronounced. At present all the money allowed by the Government for the preservation of ancient British monuments does not exceed the sum of £200 per annum. There is not a vast number of monuments that belong to this special class; but what is £200 among them? It is certainly better than the £100 which the Government considered sufficient before General Pitt Rivers persuaded it to allow the larger annuity, and from the General's letter one gathers that the whole amount is not applied for. Nevertheless, it wou'd be well if increased funds were set aside for this special purpose and someone empowered to see that the monuments were really repaired, for according to General Pitt Rivers, who has the carrying out of the Ancient Monuments Act, interesting, unique, and, above all, purely British monuments are falling into premature decay for want of timely attention. Under these circumstances one would welcome the measure on the French "historic monument" principle, if it could be carried into execution without the hard, unsympathetic restorations which, across the Channel, often make the remedy worse than the disease.

For the past two or three years General Pitt Rivers has been doing a very useful work in having constructed, under his personal supervision, models of early stone monuments in Scotland, his object being to show the development of the Celtic cross from the primitive Chi-Ro monograms in the catacombs of Rome and elsewhere. Forty-five of these models may now be seen at the galleries of the Society of Antiquaries at Burlington House, and should be visited by those interested in old examples of what to this day—to my way of thinking—constitutes the most appropriate form of sepulchral monument. Several sets of these carefully-constructed models have been made; the museum at Cambridge has asked for one set, and another will probably be sent to Oxford; while the General intends to send one or two sets to foreign museums, in the hope, he says, of stimulating interest in a series of ancient remains of a type to be found nowhere else on the face of the globe. He points out how we largely subscribe to the preservation of ancient relics and buildings out of our own country, and expresses a hope that, on a reciprocating principle, foreigners will subscribe towards the preservation of these ancient British stones. To this I would reply, that it seems a pity that we cannot, among ourselves, stir up sufficient enthusiasm and energy, and scrape together sufficient funds to do all that is necessary without outside help.

It's come at last! In the *Standard*, at the commencement of the week, I noted some correspondence headed "The Sewer Openings," and rejoiced to think that some attention had been drawn to the system of turning foul sewer-gas into the streets—a system that is all very well in theory, but which years of practice have now proved to be a miserable and literally *fatal* delusion. Engineers have deceived themselves. It was thought, and some still think, that the frequent ventilators kept, and keep, the sewers sweet and odourless; some people, I believe, even suppose that there is a *down-current* from the ventilator to the sewer! The whole thing is a farce, as I have pointed out for years, and now that there is a chance of public attention being drawn to the matter—primarily, I may with reason think, by my last week's "note"—I hope that a heated discussion will wax in many daily papers, until every ventilator within and without the Metropolitan area is hermetically sealed, and ventilation effected by some thorough and scientific means, such as I have before suggested. Either there could be a large number of upright flues or pipes fitted with gas rings under a sheet of fine gauze, which would become red hot and destroy any disease germs, or there could be a small number of large furnaces, with shafts drawing the air out of the sewer and passing it through the fire.

Walking up Snow-hill, from the markets to Holborn, one day this week I became aware of a foulness of atmosphere that I felt could only come from sewer ventilators. Looking around, there, sure enough, were the gratings! But not *one*, or *two*, or *three*. There was a perfect concourse—a veritable *galaxy* of ventilators. I was almost standing over three, and could easily count a dozen within a child's stone-throw. Their presence in such generous abundance struck one as being positively ridiculous, and I could fancy a fiendish humour possessing the planner of the sewer system as he arranged this prodigal display of ventilators. And this sort of farce is to be found in hundreds of different corners in the metropolis, whole regiments of gratings polluting the atmosphere with foul odours, and no less really scattering disease and death, because in a subtle, indirect, and indetectable manner.

Readers will be sorry to learn that Mr. Herbert Railton has been laid up for some time with injuries sustained by an accident on board an Antwerp packet-boat, he having been engaged in sketching some of the charming bits of old Flemish towns. It appears that, through some carelessness, a trap-door had been left open between two tables in the dining-saloon, or after cabin. By comes Mr. Railton, and before he can say "pen-and-ink," is down the trap like a clown in a pantomime, landing on the back of the steward engaged in the dark depths of the hold. Fortunately, our artist did not break a hole in the bottom of the vessel, or the results would have been more serious. As it was, however, Mr. Railton managed to break two ribs, even with the benefit of the steward acting as a buffer—and this is quite bad enough. Mr. Railton is recovering slowly, and will, it is hoped, soon be quite well. As to the poor steward, history has not chronicled the exact condition in which he was picked up; but, contrary to the laws of collision and concussion, he appears to have come off better than the artist.

GOTH.

CONTEMPORARY BRITISH ARCHITECTS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THE seventeenth sheet of portraits in this series, given to-day, commences with Mr. J. Wreghitt Connon, F.R.I.B.A., who commenced practice in Dewsbury, in 1868, in partnership with Mr. Henry Holtom. This association was dissolved in 1881, and after three years' independent practice Mr. Connon entered into partnership with Mr. C. R. Chorley, of Leeds. Alone, and in conjunction with his partners, Mr. Connon has enjoyed an extensive practice of miscellaneous character. Amongst the buildings designed by him may be enumerated some thirty Board Schools in various parts of the country; churches in Leeds, Farnley, Bury (Lancs), Croydon, Radbourne, Dewsbury, and elsewhere; chapels in Orsett, Dudley, Dewsbury, Balley, Leeds, Wakefield, and other towns. Amongst numerous houses, especial mention may be made of Oakham Hall, York, for Sir Andrew Fairbairn; and extensive additions to Gledhow Hall, for Sir James Kitson, Bart. Of public buildings, the chief have been the Leeds and County Liberal Club, Cookridge Hospital, the premises of the *Yorkshire Post* and the Central Stores at Hull of the Leeds Industrial Co-operative Society, and the Dewsbury Co-operative Society. Mr. Connon is the author of a work on "The Legal Registration of Architects," "A Guide to Kirkstall Abbey," and of many papers of professional and general interest. The portrait reproduced herewith was taken by Mr. Heslop Woods, of Leeds.

Mr. John Honeyman, F.R.I.B.A., has had a large and varied practice, sixteen churches in Glasgow having been erected from his designs, and a still larger number in other parts of the country, among which may be mentioned St. Michael's, Edinburgh; Portebello Free Church; Park Church, Helensburgh; Free West Church, Perth; Aberfoyle Parish Church. He has also designed churches erected on the continent and in Australia, and has carried out many additions and alterations. Among country houses designed by him may be mentioned Skepness Castle, and Auchamore House, in Argyllshire; Farniegair, Glenoran; Knockderry Castle, and the greater part of Helenslee, in Dumbartonshire; Craigton House, Stirlingshire; Roundelwood, Perthshire; Lynhurst, Selkirkshire. He has also designed several large suburban mansions. Among buildings of a more public character he designed the Free Library, Museum, and Picture Galleries at Paisley, given to the town by the late Sir Peter Coats; the Parochial Asylum at Paisley, and the Observatory there; the Town Hall at Helensburgh; the Home of the Glasgow Magdalen Institution at Lochburn; the Houses of Refuge for Females at Lockburn and Chapelton; the Home of the Prison Gate Mission; some extensive warehouses and several large Board Schools in Glasgow and elsewhere. He has very seldom engaged in competitions, but has been frequently called upon to act as professional assessor. He has taken a warm interest in professional matters. He was for a number of years a member of the Council of the R.I.B.A., and is a past president of the Glasgow Institute of Architects, and past Hon. President of the Glasgow Architectural Association. He is at present President of the Glasgow Archæological Society, and of the sanitary and social economy section of the Philosophical Society; and is also a governor of the Glasgow and West of Scotland Technical College. He has written papers which have appeared in the transactions of various societies, and has also contributed reviews and articles on various topics to magazines and other periodicals. He has published several pamphlets on sanitary and archæological subjects, and questions of political economy, and has also invented several things chiefly in connection with sanitary appliances, the latest being a ventilator, to which his name has been attached, which has come pretty largely into use. He assumed as partner Mr. John Kippie about a year ago, and the firm is at present engaged on several extensive works. Mr. Honeyman was educated at Merchiston School, Edinburgh, and at Glasgow University. His portrait was produced by Mr. Stuart, of Glasgow.

Mr. E. Hoole, F.R.I.B.A., was a pupil of the late James Simpson, C.E., at one time President of the Institution of Civil Engineers, whom he assisted in the design and construction of engineering buildings for the Chelsea, Lambeth, Cardiff, and other waterworks companies. Mr. Hoole

commenced practice in London in 1864. Among a considerable number of works may be mentioned Messrs. Chubb and Sons' lock and safe factory and workmen's dwellings, industrial dwellings at Whitechapel, Lambeth (Surrey Lodge), St. Pancras, Marylebone, Chelsea, Westminster, Peckham, Southwark, Bristol, &c.; mission churches at Naples, Cannstath, Belise, Kandy, Newfoundland, &c.; Lausanne College, Morley Memorial College, Lambeth; the University Settlements; Toynbee Hall, Whitechapel; Bedford College and Red Cross Hall, Southwark. His portrait is by Mr. Bassano, of Bond-street.

Mr. Hugh Stannus, F.R.I.B.A., was born and educated at Sheffield, coming to London in 1862. He was a student at the R.A. under Mr. R. Phené Spiers. He passed the R.I B.A. exam., gaining the Ashpitel Prize, in 1873; he also gained the Institute medal for an essay on "The Decorative Treatment of Constructive Ironwork," and was elected a Fellow in 1887 He is a member of the A.A.; has served as Vice-President, as Chairman of the Class of Design, as Visitor of the Elementary Class, and for some years as Secretary of the Members' Soirée, he having been the first to introduce the architectural opera in one written and composed by him, which was performed about a dozen years ago. He also inaugurated the series of A.A. trips to Italy, taking the first party in 1880, and showing the practicability. He has carried out offices at Bedford, cottages in Surrey and Gloucestershire, and alterations to mansions in Carlton House-terrace, Hampton Wick, Grafton-street, &c. Having had some success as a lecturer, he has since devoted himself more to that than to the practical side of the profession. He holds the appointments of Lecturer on Applied Art at South Kensington, Teacher of Architectural Ornament at the R.A., and Lecturer on Applied Art at University College; he is also Lecturer for the A.A. on the History of Classic Architecture, and will be one of the Cantor Lecturers for the Society of Arts next session. Mr. Stannus prepared a design for the treatment of the architectural decoration of the dome of St. Paul's Cathedral, and was engaged to make the model full-size cartoons which were fixed in the dome for public inspection. He was connected also with the completion of the Wellington Monument, from the designs of the late Alfred Stevens, the sculptor. The statue erected in Essex-street, Strand, in connection with the Unitarian Sunday School Memorial was sculptured by Mr. Stannus. His portrait is from the camera of Messrs. Hellis and Sons, Regent-street.

Mr. John Gibson, F.R.I.B.A., the Royal Gold Medallist at the R.I.B.A. this year, was a pupil of the late Sir Charles Barry, whose office he entered in 1835. In the following year, when the first premium in the great competition for the new Palace at Westminster was awarded to his master, he was his only pupil. After serving three years of pupilage he remained his master's assistant for six years, and was more or less engaged on such works as Trentham Hall, University College (Oxford), Harewood House, near Leeds, Duncombe Park, the Board of Trade, Whitehall, and above all, the Houses of Parliament, on the details of which Mr. Gibson was largely employed. Commencing practice, therefore, in 1844, after so excellent a training, Mr. Gibson appears to have entered at once on his most successful career. Among his earlier works was the National Bank of Scotland, Glasgow; the Imperial Fire and Life Office, Threadneedle-street; and the well-known and characteristic twin-spired Romanesque Chapel in Bloomsbury, which was erected in 1847. About this time he carried out many works in Warwickshire: Compton Verney, for Lord Willoughby de Broke; Wroxton Abbey, for Colonel North; Charlecote Park, for Mrs. Lucy; Guy's Cliff, and several churches. He built his ecclesiastical *chef-d'œuvre*, Bodelwyddan Church, for Lady Willoughby de Broke. Plâs Power, near Denbigh (1858), is the clever re-clothing of a once commonplace-looking house. The Todmorden Fielding Family have availed themselves largely of Mr. Gibson's skill: Mr. Joshua Fielding, at Nutfield Priory, Kent; Mr. John Fielding, at Dobroyd Castle, and Mr. Samuel Fielding, at Central Vale—both near Todmorden, where also he built the Town Hall and the Unitarian Church, for the same family. But the most remarkable of Mr. Gibson's professional connections is that with the National Provincial Bank of England. This great banking company apparently employed nobody but Mr. Gibson as their architect so long as he remained in practice. He built the head office in Threadneedle-street, and the branch bank in Piccadilly, and also upwards of forty branch banks in different parts of the country—some of them, as, for instance, that at Birmingham, of great merit and importance. In London, Messrs. Child's Bank, and the home of the Society for Promoting Christian Knowledge, the first building erected in Northumberland Avenue, where its proportions are now seen to a disadvantage from the height to which its neighbours have arisen. The following is a list of his leading buildings:—Banks: National Provincial Bank, head and branch offices, London, and branches at Birmingham, Durham, Middlesborough, Newcastle-on-Tyne, Salisbury, Southampton, South Molton, Stockton-on-Tees, Sunderland, &c.; Child's Bank, Fleet-street; the City Bank, Exeter; and the National Bank of Scotland, Glasgow. Business Premises: Society for Promoting Christian Knowledge, Northumberland Avenue; Imperial Insurance Offices, Old Broad street; the Stock Exchange and Bank Buildings, Glasgow; and the Town Hall at Todmorden. Churches: Bodelwyddan, near St. Asaph; church at Charlecote Park, and Combroke Church, Warwickshire; Plâs Power Church, near Wrexham; church on Bix Common, near Henley-on-Thames; church at Lighthorne, and Old Milverton Church, Warwickshire; the Bloomsbury Chapel; and Shenstone Church, Staffordshire. Houses: Charlecote Park, Warwickshire: restorations, new wings, &c. (1852-67); additions at Guy's Cliffe, Warwick; Woodcote, near Warwick; Nutfield Priory Mansion, Surrey; Imberhorne, near East Grinstead; Wroxton Abbey, Oxfordshire: new wings and restorations; Plâs Power, near Wrexham; Myton Grange, near Warwick; house at Highgate for Mr. F. R. Pickersgill, R.A.

Mr. Chas. E. Ponting, F.S.A., has practised at Marlborough, Wilts, since 1870, and, as usual with provincial architects, his works have been of a varied character. Amongst his new churches and restorations may be mentioned:—Mere, Overton, *Bishop's Cannings, *Broad Hinton, *Stanton, St. Quintin, the unique monastic church of Edington, *Marden, Netheravon, Pewsey, and Holt, Wilts; others partly restored under his care are Latton, *St. Mary's, Marlborough, Wanborough, Charlton, Avebury, Poulshot, and Winsley in Wiltshire, and *Down Ampney, *Tormarton, and Almondsbury in Gloucestershire, besides those in which he has added such features as fonts and reredoses. A special feature in his practice has been the number of dangerous towers to be dealt with, some instances of which are distinguished in the above list by an asterisk. Mr. Ponting issued a careful report upon the state of the Eleanor Cross at Waltham in 1887, and was architect for its recent restoration; the stones of Temple Bar, after lying on the ground for ten years and having lost the perishable marks made on them when taken down, have been successfully re-erected under his care and form a striking gateway at the entrance to Theobald's Park, Herts. New schools have been erected from his designs at Lockeridge, Savernake, and Baydon, Wilts, and a dispensary and reading-room at Kennet, new parsonages at Ogbourne and South Marston, besides enlargement in many other cases. A new wing and tower have recently been built at Theobald's Park, the seat of Sir H. B. Meux, Bart., which comprises a museum, in which has been erected the beautiful oak staircase saved from Lord Burleigh's Theobald's Palace. Deverill House, and several other private houses in Wiltshire, and the enlargement of the Manor House at Potterne, and others are from his designs. He has also dealt with the historical specimens of domestic architecture: South Wraxall and the Church House, Potterne; lodges at Worcester Park, Surrey, and some sixty model cottages, and many farm homesteads on the estates of the Baroness Burdett-Coutts, the Marquis of Ailesbury, and Sir Henry Meux have been designed and carried out by him. His design for a new Town-hall at Marlborough was recently adopted by the council, but the project is in abeyance. Mr. Ponting holds the offices of diocesan surveyor for the Archdeaconries of Wilts (Dio. Sarum) and Bristol (Dio. Glouc. and Bristol), and surveyor of Marlborough College. He has devoted much time to archæology, and contributed numerous papers to the *Archæological Journal*, *Wiltshire Archæological Magazine*, *Antiquary*, *Reliquary*, &c. He was elected Fellow of the Society of Antiquaries in June, 1888, and represents both that body and the Wiltshire Archæological Society as local secretary. Mr. Ponting's photograph was taken by Mr. W. Hawker, of Bournemouth.

Mr. Thomas James Flockton, F.R.I.B.A., F.S.I., of Sheffield, was educated in the office of his father, an architect and surveyor of considerable practice in Sheffield, and, after spending some time in London and elsewhere, commenced practice in partnership with his father in 1845. Subsequently he had for partner the late Mr. G. L. Abbott, and, more recently, the gentleman now associated with him, a former pupil, Mr. E. M. Gibbs. Mr. Flockton has, in conjunction with these gentlemen, been the architect of a number of churches, parsonages, and schools, and, in Sheffield and the neighbourhoods of Endcliffe Hall, Tapton Hall, and many other gentlemen's residences, several breweries and manufactories, many important ranges of street buildings, and of the savings bank, police offices and cells, Sheffield and Rotherham Bank, Town Hall alteration and enlargement, banqueting hall for the Cutlers' Company, Albert Music Hall, Corporation offices, parochial offices, Fire Brigade Station, Channing Hall, and Mappin Art Gallery; and also in Rochester, the new Corn Exchange; and in London, a set of offices in Mincing-Lane. He has also had an extensive practice as a surveyor, having held for many years the appointments of surveyor to the town trustees, church burgesses, and other public trusts in Sheffield, and been valuer and adviser to the corporation in the matter of an extensive scheme of street improvements, for which Parliamentary powers were obtained in 1875, and which is now on the eve of completion. Mr. Flockton was the first president of the Sheffield Society of Architects and Surveyors, in the formation of which, in 1887, he took considerable interest. His portrait (which is of special interest just now on account of the Sheffield Municipal Buildings Competition) was taken by Mr. Vander Weyde, of Regent-street, London.

Mr. W. F. Unsworth, A.R.I.B.A., of Westminster, was born in 1851, and articled to Mr. James Wilson, of Bath, in 1868. He went to France in 1872, and entered an architect's office in Paris, finding there was much work to be done after the Franco-Prussian War. Subsequently he travelled for three months, and on his return to England entered the late Mr. George Edmund Street's offices in 1873. Was there about two years, and then went to the late Mr. William Burges, A.R.A. Mr. Unsworth started practice in 1876. His first work of any importance was the Shakespeare Memorial Theatre and Library Buildings at Stratford-on-Avon. He has exhibited in the R.A., besides various drawings of the above. The following have been illustrated in our pages. The Hill, Stratford-on-Avon, for Mr. Edgar Flower; Shepherd's Spring, Hants, for Mr. William Jones-Lloyd; Sion House, co. Tyrone, for Mr. E. T. Herdman; house at Minehead, Somerset, cottage hospital, Potter's Bar, for Mr. Henry Parker; warehouse, Star Yard, Messrs. Stevens and Sons. A few of his latter works not published are:—Mr. Dunthorne's gallery in Vigo-street, W.; schools at Baron's Court, for His Grace the Duke of Abercorn; Christ Church, Woking; St. Mary's Church, Woking; restoration and addition Beckwith Knowle, Harrogate, for Mr. R. Wigglesworth; Duchy Court, Harrogate, addition, for Mr. F. Herskind; Tangley Park, Worplesdon, for Mr. C. Barclay Holland; Woodhambury, Surrey, Woking, for himself. Mr. Unsworth's portrait is from a photograph by Mr. R. Faulkner, Baker-street.

The foundation-stone of the new County Court and Police buildings at West Bromwich was laid on Friday week. Messrs. Wood and Kendrick are the architects, and Mr. J. Rowbotham the builder.

Mr. John Anthony, of Rochester, surveyor, whose name has appeared in the local newspapers of late in connection with police-court proceedings by his wife for maintenance, died very suddenly on Thursday in last week. Deceased at one time held a good position in the city, but some years ago he began to give way to excessive drinking, and the habit had dragged him down very low in the social scale. On Thursday a police-constable served him with an order of the magistrates to pay his wife £1 a week, and in the evening the same officer was called to the Rising Sun Inn, Star-hill, where deceased had been discovered dead in the w.c. The cause of death was apoplexy. Deceased was about 50 years old.

Building Intelligence.

Edgbaston.—The dedication of the new organ, ıoir stalls, and mosaic pavement recently pro-ded at St. George's Church, Edgbaston, took ace on Saturday. Altogether about £15,000 us been spent on the improvements. The organ as built at a cost of £1,500 by Messrs. Brindley d Foster, Sheffield and London. The choir alls, which are executed in English oak, are in e Early Decorated style. The ends to the ergy and men's stalls are massive, the tops rminating in carved scrolls of foliage, with gures and animals resting thereon, the clergy sks having the winged emblems of the four vangelists, and the men's stalls figures of angels ith musical instruments. On the front edge of e ends of the clergy stalls are placed, under hly crocketed canopies, the four Evangelists neath their respective emblems; and the four ajor prophets are placed in the front of the en's stalls. The fronts to the boys' desks e of open arcaded work, moulded and rved. At the back of the stalls, on the rth side, has been placed a screen of open acery and moulded work, with foliage cusps. ne stalls and screen have been designed by Mr. A. Chatwin, architect, Birmingham, and ecuted by Mr. Bridgeman, sculptor, of Lich-ld. The marble Roman mosaic pavement, nich now forms the floor of the choir and actuary, is of Gothic design; and Rouge Royal rble has been substituted for stone in the ps within and without the communion-rail. ne design is a series of five square panels, anged lozengewise. Within these panels, d surrounded by ornamental quatrefoil borders, e the Evangelistic symbols, and in the fifth nel is St. George combating the dragon. tween these panels, on a white ground, is a oll ornament, and on each side is a rich rder. The mosaic is executed principally in oes of about ½in., with others of less dimen-ns as the exigencies of the case required. The rk was designed and executed by Messrs. rke and Co, London.

Edinburgh.—At the Edinburgh Dean of ild Court last week, warrant was granted to kirk-session of the High Church to execute St. Giles' Cathedral certain operations affect-the Chambers Aisle and the construction of a ies' retiring room. In regard to the Chambers ile, it is proposed to take down the wall between north aisle and the old session-house or try, and to support the vaulting and masonry ve with a Gothic arch; to lower the existing r of this aisle and substitute a concrete or hed brick fireproof floor between the memorial e and the heating-chamber below; and to ove the present roof and plaster ceiling, and t a groined vault, with wooden roof above ered with lead—the plaster on the walls to be red off, and the walls finished and pointed, to espond with the rest of the building. The h-street elevation of the new room will monise with the Cathedral building. The itects are Messrs. M'Gibbon and Ross, derick-street, Edinburgh.

Penshaw, Manchester.—The splendid baths ch have been erected by the Whitworth tees have been formally handed over to the nshaw Local Board. The baths from to last, building and equipment, have cost t £15,500. Fronting Ashton Old-road, the ation of the building is faced with deep-red bon bricks, set in black mortar, the undercut ts and window jambs being in moulded terra-a. The front is set back about 10ft. from the , and the forecourt is inclosed with a brick terracotta boundary wall, surmounted by ght-iron railings. The entrances to the and second-class baths are placed one on side of the ticket office. Folding doors lead e first-class baths through a wide corridor, which access is obtained to the Roman and er baths and the plunge and Turkish baths. e Roman baths are reached through dressing-ms. These baths are lined with mosaic tiling supplied with hot and cold water and a er apparatus. Six slipper baths, attached to ler dressing-rooms, are of glazed earthen-without any wood framing. The walls of orridors here are all lined with white and d glazed bricks, the floors are laid with ic tiling, and the whole space is lighted from oof by raised lights. The first-class plunge-has a water area of 59ft. by 24ft. in a room measuring 72ft. by 33ft. 6in. The walls are faced with a dado of enamelled tinted and buff Aston Hall bricks, with bands and strings of red Ruabon bricks. The bottom and sides of the bath are lined with white glazed bricks. The fourteen dressing-boxes are of pitch-pine framing, and each is fitted with seat and lagged floor. Steel principals, filled in with panels of wrought ironwork, support a roof of pitch-pine spars, which are all dressed and covered with pitch-pine boarding. A sunk foot-bath is provided at one end of the room. The Turkish bath is reached by a flight of stone stairs from the end of the main corridor, and consists of a cooling-room, 26ft. by 25ft. a shampooing-room, 16ft. square, and three hot rooms, one being 22ft. by 13ft. 6in., another 22ft. by 11ft., and the third 14ft. by 8ft. 6in. The cooling-room has a partly open roof, in which are large ceiling lights filled with tinted glass. The walls are lined to a height of 7ft. 6in. with buff-coloured glazed bricks, with a band of three courses of grey bricks, and above with ivory-white glazed bricks. On one side are five dressing-boxes with pitch-pine divisions, and fitted with curtains in front. Each box contains a brass couch and a mattress. Other couches will be placed on the opposite side of the room. In one corner is an attendants' apartment. A spiral staircase leads from the cooling-room down to the first-class plunge-bath. The shampooing-room is reached by a flight of four marble steps from the cooling-room, from which it is separated by a short corridor. It is lined with white glazed bricks and lighted from the top, and is equipped with two marble shampooing slabs, two needle baths and douches, lavatory basins, and a vapour bath. The floors and ceilings of the hot rooms, entered from the same corridor, are constructed of concrete carried on iron joists, and the walls are lined with mosaic tiling of various tints and patterns. The windows are all double-glazed, the inside sashes being fitted with leaded lights of tinted glass. Lounging couches and chairs are scattered over the rooms. The second-class bathers pass into a large hall 37ft. 6in. by 12ft., lighted from the roof, and containing a stone staircase up to the gallery which runs round the plunge-bath. The bath has a water area of 76ft. by 29ft., the bathroom being 90ft. 6in. by 37ft., and 23ft. high to the springing of the roof. The walls are faced in a similar manner to those of the first-class plunge. A gallery formed of concrete 8in. thick and wrought-iron joists carried on cantilevers of the same material give access to the second-class slipper baths, sixteen in number. All the baths here are of glazed earthenware, without any wood framing. To the right of the second-class entrance are the superintendent's private office and committee-room. Subways extend under all the footways of the bath, with access to all water and steam heating pipes. The architects are Messrs. J. W. and R. F. Beaumont, St. James's-square, Manchester.

Yeadon. — Last week the foundation-stone was laid of a church at Yeadon, in the presence of a large gathering of people. It will replace a mission-room, now inconvenient and dilapidated, which was originally built as a Wesleyan chapel in the year 1766, and used as such by the Wesleyan body until 1834. The new site is at the junction of Haw-lane and Silver-lane. The style will be Perpendicular. In plan the church will consist of a nave of five bays, 64ft. long by 25ft. wide; south aisle, 11ft. 6in. wide, shallow transept, chancel of three bays, 32ft. long by 21ft. wide, with organ-chamber on the south, and clergy and choir vestries adjoining. A tower will hereafter take the place of this porch, and an octagonal turret (which will form the staircase of the future tower) is now being constructed. This turret will be finished with an open-timber bell-cot. Owing to the rapid fall of the ground the west gable of the nave will be a prominent feature, and will contain two lofty three-light windows with traceried heads, and a niche in the centre of the gable above them. The east gable of the chancel will contain a seven-light window, with tracery in the head under a four-centred arch. The treatment of the north and south sides of the nave will be entirely different. On the south is an arcade of stone pillars with moulded capitals and pointed arches, above which is a range of low clerestory windows. On the north are large windows with flat heads and tracery of simple character. The sitting accommodation will be about 350. The fittings of the chancel will be of oak, and a low stone screen wall will mark the division between the chancel and the nave. The chief cost of the building (exclusive of site) will amount to about £3,000. The chief contractors are—Mr. W. Flesher, mason's work, and Mr. James Taylor, joiner's work. The work is being carried out from the designs of Messrs. J. and F. Healey, Bradford, under the superintendence of Mr. G. H. Elliott, clerk of works.

CHIPS.

The foundation-stone of a new cottage hospital, which it is proposed to erect at Edington, near Bridgwater, in memory of the late Captain J. A. Fownes Luttrell, was laid on the 3rd inst. The hospital will consist of two wards, each 20ft. by 15ft., one for females and the other for males, with bathrooms, lavatories, &c. The doctors' room and nurses' room are built upon the ground floor, as are also the kitchen and offices for the house staff. Upstairs there will be a sitting-room and two bedrooms. The building will be of red brick. The builder is Mr. H. T. Spiller, of Taunton; and the architect Mr. C. H. Samson, of Taunton.

The spire of St. Catherine's Church, Pontypridd, Glamorganshire, about 75ft. in height, is to undergo extensive restoration. The framework and wall-plates at the bottom being perished must be reinstated, all the slates removed, framework strengthened, and the whole spire newly slated. Four new stone gablets are to be constructed at the lower part of the spire, in which will be placed a clock. The work of restoration, which will require much care, and will cost about £650, has been intrusted to Messrs. Kempson and Fowler, architects, Llandaff; Messrs. W. Thomas and Co., Bute Docks, Cardiff, being the contractors.

A new church is in course of erection for the United Presbyterian congregation of Largs, solely at the instance of Mr. John Clark, of the Anchor Mills, Paisley. In style the church is Gothic of the Decorated Period, freely treated, and depending more on its massiveness and good proportion than on elaboration of detail for effect. The total accommodation of the church is 753, exclusive of choir and elders' seats. One of the main features of the church will be the spire, rising to a height of 150ft. from the ground-line, to carry which a foundation of concrete 35ft. square has been put in. The hall, which will accommodate 230, will be finished in a simpler style than the church, and have an open-timber roof.

On Saturday Mr. Thomas Codrington, M.I.C.E., held an inquiry in the Council Chamber of the Guildhall, York, respecting the application by the York City Council to the Local Government Board to borrow £48,000 for the provision of Municipal Offices, Courts of Justice, and Police and Fire Brigade Stations; £32,594 for purposes of street improvement, and £9,291 for markets, depot, baths, and other purposes. Mr. Creer (the city surveyor) explained the plans of the new buildings.

Colonel Luard, C.E., Local Government Board Inspector, held an inquiry at Rhyl on Friday as to an application by the Improvement Commissioners for powers to borrow £350, in addition to £650 already obtained, towards extending the promenade, the board, in constructing the work, having exceeded its estimate. An application was also made for power to borrow £885 for the provision on the parades of shelters and a ladies' lavatory. There was no opposition to the applications.

The church at Winestead, Holderness, which has recently undergone a complete restoration, has been reopened by his Grace the Archbishop of York. The building was in a ruinous state, and has been repaired at a cost of £2,250, from plans by Mr. Temple Moore, of Hampstead.

The Nottingham town council has decided to support a proposal by the Manchester, Sheffield, and Lincolnshire Railway Company, under which they will seek Parliamentary powers to construct a line through Nottingham, to join the Metropolitan Railway at Aylesbury, and so form a new route to London.

The Minet Public Library, Camberwell, which has been built by Mr. W. Minet for the parishes of Camberwell and Lambeth, will be opened to-morrow (Saturday) afternoon by Sir Lyon Playfair, M.P.

The town council of Stafford, by ten votes to nine, granted Mr. Blackshaw, the borough surveyor, an honorarium of £250 for extra services performed by him in connection with the new water supply. A further recommendation that Mr. Blackshaw's salary be also raised from £250 to £300 a year was referred back to the committee.

Memorial stones of a new Liberal Club were laid at Whitchurch, Salop, on Saturday. The club will occupy the site of premises, which are being remodelled by Mr. Richard Powell, builder, of Whitchurch, from plans by Mr. J. H. Pickard.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—R. and N.—R. D. and Co.—Col. E.—S. of A.—T. H.—H. A.

Correspondence.

THE FRENCH CONGRESS OF ARCHITECTS.

To the Editor of the BUILDING NEWS.

SIR,—I do myself the pleasure of forwarding you a *résumé* of the report of the meeting of the Congrés des Architectes Français, held at Paris a few days ago, and trust that it may be of interest, especially as the questions discussed are under debate in England, as well as on this side of the Channel.

The first point raised was the question of establishing on a better footing the annual meetings of the Central Society—namely, by forming in advance a well-arranged programme; that each provincial society should send to the Congress a certain number of delegates, and count a number of votes in proportion to the numerical importance of the society; and, lastly, that the expenses of these provincial delegates should be defrayed by a "Caisse de Congrés," a special fund which would be maintained by the subscriptions of each society in proportion to its numerical value.

The Congress is organised by the Central Society at Paris, this Society sending forth general invitations for the meetings of the Congress to all French architects. Generally, however, only those whose business may call them to Paris, or near the place of meeting, respond to the invitation. Each member may, if he likes, put his name down to speak at the meetings, but it is rarely found that the list of speakers is too full. In this way, there being no well-arranged programme, there is generally little chance of any serious discussion. The Congress committee therefore naturally desires that a fund may be established, thus permitting each provincial society to send to the Congress a good representation of its members.

The "Commission des Honoraires," or committee of architects' fees, sent in its report for the deliberation of the general assembly.

The rule for architect's fees, which was established on the 12th Pluviôse, au VIII. (1st Feb. 1800) and which has since always stood for law, has, in the opinion of the Commission, often been applied in the case of law-suits, without proper consideration.

The Commission thought it desirable to study and develop its application to the many questions that now raise difficulties.

For 90 years, the 5 per cent. due, according to this "avis," to Parisian architects comprised ordinary work at Paris only.

The Art. 6 estimated, besides, that double the usual fee is due for the same work when executed at more than five kilomètres distance from the place of residence of the architect, the journey expenses being at the charge of the architect.

Again, "that when the work exacts, as it sometimes happens, models and drawings, occasioning extra expense, this must be paid for separately."

Thus this "avis" is vague as to the distinction between ordinary work, for which the 5 per cent. is due, and work which, being more or less artistic, demands more study and care. It determines only that the architect's fees should be graduated in proportion to the importance of the work, and its situation in reference to the residence of the architect.

The "Commission des Honoraires" wished to arrive at a more settled determination of the document, and thus, being able to distinguish between ordinary and extraordinary work, to fix the fees in proportion to the difficulty or the artistic work necessary for certain exceptional works. Again, it was thought desirable that the fees should be based on the estimated cost of the proposed work, and not on the sum dispensed after the contractor's discount was allowed. That the drawings, &c., should remain the property of the architect; also, that no one should have the right to reproduce, without the permission of the architect, any of the plans or façades originated by him.

For architects' fees, the following was proposed:—

Ordinary work	5	per cent.	For work exceeding £400.
Artistic ,,	7	,,	
Extra artistic work	10	,,	
Dangerous work	10	,,	

Below £400, 10 per cent.

Supplementary fees to be demanded in the case of surveys, obtaining authorisation to build, litigation, extra supervision, changes made by the client, special models, &c.

In the case of work being at a distance, special expenses should be paid, such as first-class railway fare, carriage and hotel expenses (average 25 francs per day), absence in the interest of the works (100 francs per day).

Consultations to be paid for at the rate of 12 francs 50 (ten shillings) per half "vacation" of one hour and a half; four "vacations" of three hours each at 25 francs producing 100 francs per day.

These figures, submitted by the "Commission des Honoraires," appeared to be slightly high as an average; doubts were also entertained by the Congress as to the application of these figures. They are, however, adopted by the Parisian architects, to whom only this tariff applies. It was proposed that a list of these fees, &c., in book form should be published and circulated.

Trusting you will excuse a rather hasty letter,
—I am, &c., ARTHUR VYE PARMINTER.
Palais des Beaux-Arts, Lille.

SPECULATIVE BUILDERS.

SIR,—There is a good time coming for the "jerry builder," as the district surveyors elected in the future can only go about the buildings between 11.0 and 4.0. What they will do sitting in their offices I cannot say. Most people find half an hour a week quite sufficient to be indoors.
—I am, &c., HIRAM.

P.S.—The "Goth" refers to the price of coal. Surely he is wrong, as coals have never been dearer than since the absurd abolition of the coal dues, a tax nobody missed, and which a fourpenny rate will have to meet.

UNDERPINNING IN THE EUSTON-ROAD.

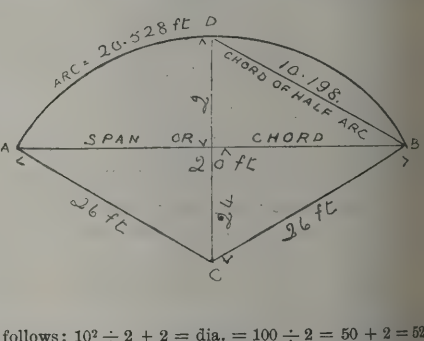
SIR,—In your notice of the underpinning operations, your issue July 11, the address of our works should have been 18, Bermondsey-street, London Bridge; basement also has been underpinned, to allow a headroom of 8ft. 9in., not 6ft.
—I am, &c., H. J. WILLIAMS.
18, Bermondsey-street, London, July 14.

Intercommunication.

QUESTIONS.

[10315.]—**Paris.**—Will "Some One Who Knows" be kind enough to give a young architect the name of a small guide to Paris and neighbourhood having an architectural tendency? If a few chief places were mentioned which should not be missed (in a brief stay of 7 or 10 days), and at which the time could be most instructively and profitably spent, chiefly from a modern architectural and constructive point of view, it would, no doubt, be very acceptable to many readers, especially one.—ZERO.

[10316.]—**Staining New Panelling.**—I have some new oak panelling which is put into a room where there are already pitch-pine doors and architraves. The polish of these latter has been pickled off, leaving doors a darker colour. I want to stain oak and pine, so that they may be as much alike as possible (a clear, transparent deep brown of a cool colour). Can any of your readers advise best method of doing this?—X.



[10317.]—**Excavation.**—In the construction of a sewer, I find that there are 1,523 cubic yards of excavation. How can I find the number of cubic yards required to refill the trench after the sewer is laid and the surplus left to cart away?—STUDENT.

[10318.]—**Specifications.**—Will Mr. Lovegrove, or other authority, kindly state which he considers to be the best and most recent work on above?—INQUIRER.

[10319.]—**Architect's Designs.**—An architect finding that his designs have been used by contractors in works of their own, has the architect any ground for a claim against them? Would a clause in a specification prohibiting the use of the designs for any other work than that for which they are designed, act as a patent in protecting architects against any infringements of their rights?—A. R.

REPLIES.

[10303.]—**Area of Segment of Circle.**—If Arthur Shaw is not acquainted with trigonometry, H. Raven's reply will not, I fear, be of much use. To measure the area of a segment by mensuration, proceed as follows: Let A D B be the given segment whose span is 20ft., and rise 2ft: Rule for finding the centre of the circle of which A B is the segment is—the square of half the span divided by the rise, plus the rise, or $\left(\frac{\text{chord}}{2}\right)^2 \div$ the rise + the rise = the diameter, which, divided by 2, gives the radius. Then, to find the centre of this circle, proceed

as follows: $10^2 \div 2 + 2 =$ dia. $= 100 \div 2 = 50 + 2 = 52$ diam. $52 \div 2 = 26$ radius. Bisect A B and continue until centre is reached 26ft. from D. Join A C B C, which gives sector C A D B. Now, if we find the area of this sector and deduct the area of triangle C A B, the remainder will be the area of the segment A D B. Area of sector = length of arc A D B × ½ radius C B. Rule for finding length of arc is ⅓ (8 times chord of half arc = chord of arc). Join D B, which is chord of half arc. To find the length of D B the rule is square the other sides (2′ and D 10′), and extract the square root of their sum. $2^2 = 4$. $10^2 = 100 = 104$; square root of $104 = 10{\cdot}198$. $\times 8 = 81{\cdot}584 - 20 = 61{\cdot}584 \div 3 = 20{\cdot}528$ as length of arc. Area of sector $= 20{\cdot}528 \times 13 = 266{\cdot}864$ square feet. Area of triangle C A B = 20 × 24 = span or base × ½ the height = 20 × 12 = 240.

Area of sector ...	266·864	square feet.
Area of triangle ...	240	,, ,,
	26·864	area of segment.

—FRED. W. MCCOSKRIE.

[10309.]— **Devonshire Churches.** — "C. H. S." should examine, study, and make drawings from Ottery St. Mary, a very fine specimen of Early English; churches at Plymstock, Yealmpton, Bishop's Palace Chapel, Exeter, Frithelstock Priory, Collumpton, Totnes, Tiverton, and Bishop's Teignton—the last a Norman church. The adjoining county of Somersetshire is far richer in churches, especially the neighbourhood of Wells. Besides its fine cathedral, the magnificent church of St. Cuthbert should be visited—a fine Perpendicular church and tower; also the church of Ditcheat, with its grand central tower and wood screen across the chancel stalls and pulpit; the noble towered churches of Evercreech and Wrington—the latter has one of the grandest towers for which the county is celebrated. Congresbury Church has a fine spire; Axbridge and Cheddar, both with towers of the Western type, are worth visiting, and the pass of the Cheddar Cliffs and the caverns will well repay the admirer of natural scenery. Glastonbury Abbey, Shepton

llet, Taunton, Bath Abbey, and Bristol are other ractions.—G. H. G.

10314.]—**Ancient Lights.**—Is this question pro-ly put, as it begins by stating that the light is in the ble end, and continues that the sill is 2ft. 6in. off the ound level. Assuming that the window is near the ound, B. must be careful that the distance between his ilding and A.'s window is at least equal to the height the new building. Cannot terms be arranged?—Lovegrove.

10314.]—**Ancient Lights.**—This question will pend on how long A.'s window has been in existence, or ether it has enjoyed light for 20 years. If not, B. can ild close to A.'s window, and obstruct the light reto.—G. H. G.

CHIPS.

Mr. John Shewell Corder, of Ipswich, is about to blish a small work, illustrating the old corner ets of that town, with descriptive notes, and his io will include some picturesque sketches of the uses from the same place. The edition is limited 200 copies, and will, it is hoped, be ready early in igust.

The London and South-Western Railway Com-ny, who are largely extending their works at stleigh (till recently known as Bishopstoke) nction, have accepted the tender of Mr. Jonas chols, of Southampton, at £3,000, for building institute for their workmen on the cricket-field.

t has been decided to rebuild the Glyn Church Risca, Mon. Plans are being prepared by Alfred ash, M.S.A., of Friars-chambers, Newport.

The twenty-fourth annual excursion of the York-re Archæological and Topographical Association k place on Thursday, the 10th inst., when some members and their friends journeyed from eds and York to Cotwold, whence the Cistercian bey of Byland was visited, under the leadership Mr. W. H. St. John Hope, F.S.A.; Cotwold urch, where Mr. J. T. Micklethwaite, F.S.A., ed as guide; and Newburgh Priory, the seat of George Wombwell, a 17th-century mansion lt into the remains of an Augustinian religious use.

Memorial stones were laid in Kinsey-street, gleton, of new Primitive Methodist Chapel and ools. The chapel will seat 552 persons, and eath it will be the schools. It replaces one on same site built in 1821, and will cost £2,200. A. Tomkinson, of Tunstall, is the architect.

Mr. Zachariah Boulton, for many years surveyor the local board of Horncastle, died last week at advanced age.

The reredos in St. Austell Church was dedicated the Bishop of Truro on Sunday week. The dos is of Derbyshire alabaster, and consists of niches, having carved canopies, filled with aics representing the four Evangelists, with a e centre panel which is to be filled with statuary, a retable. The diaper work has been carved gilded. The design is by Mr. J. Piers St. yn, and Messrs. Luscombe and Son, of Exeter, e carried out the work. Mr. G. H. Fellowes ane, of London and Plymouth, has been in-cted to prepare designs for the restoration and ration of the chancel.

ew high and low level reservoirs are being ted at Penycoitre and Merthyr Dovan, for the y and Cadoxton local board, under the super-idence of Mr. J. A. B. Williams, C.E., Cardiff, consulting engineer. The contractors are Messrs. and Sons, and the high level reservoir will be pleted in the course of a month, when the le district of Barry and Cadoxton will be fully lied. Improvements at the gasworks are being ed out under the direction of the permanent neer, Mr. F. M. Harris.

The local board of Openshaw having applied to Local Government Board for sanction to borrow 350 for purposes of public walks and pleasure unds, and £1,150 for works of private improve-, an inquiry was held on Friday by Colonel I. Ducat, R.E. Mr. Mayor, surveyor to the local d, showed that the proposed park had an area ,643sq.yd., and that the streets which it is pro-d to pave and sewer are 22 in number, situated rious parts of the township.

bridge to connect the two parts of New Bromp-now separated by a deep cutting of the London, ham, and Dover Railway, is about to be erected. railway company find half the cost, and the half will be raised by public subscription. work was commenced by Messrs. Ball and mon, the contractors, on Monday.

The foundation stone of a Wesleyan Institute aid at Launceston on Friday. Tudor in style, joins the chapel, and will be built of local , with Polyphant dressings and granite quoins plinths. Accommodation will be provided in ssembly hall, on the first floor, for 125 persons, the outlay will be £650. Messrs. Hine and rs, of Plymouth, are the architects, and Mr. road, of Launceston, is the builder.

LEGAL INTELLIGENCE.

Easements in Air.—Bass v. Gregory.—This case was tried before Mr. Baron Pollock, without a jury, at the recent Nottingham Assizes, whence it was adjourned for further consideration. It was a claim of a peculiar nature—viz., to have a free passage of air allowed through a defined hole which ran from the plaintiff's rock cellar into a dry well situate in the defendant's yard. This well was covered by a grating, and the defendant had practically stopped this up. The plaintiff is the owner in fee of the Jolly Anglers publichouse at Nottingham, to which the cellar in question in attached, and the defendant is owner of cottages and a yard adjacent thereto. Besides disputing the facts, the defendant's counsel contended that the right to air did not come within the words "or other easements" in section 2 of the Prescription Act (2 and 3 Will. IV. c. 71), and that it had never been decided that such a right could be acquired even by immemorial user.—Mr. Baron Pollock, in giving judgment in the Court of Queen's Bench on Tuesday, stated the nature of the plaintiff's claim as owner in fee of the Jolly Anglers publichouse; she rested it on uninterrupted user from time immemorial, and use and enjoyment for fifty years. The plaintiff further relied on the Prescription Act and the presumption of a lost grant. There was also an assertion of an express grant; but no evidence was adduced in support of it. The plaintiff's case was that the defendant had removed a grating across the well, and prevented the passage of air up through the well, and she claimed damages and an injunction. There was a counter-claim by the defendant for trespass done to his premises, but nothing turned upon that. The fact to be decided was: Had the plaintiff established her claim? It was said for the defendant that the claim was of so peculiar and novel a character that no judge or jury ought to presume the existence of such a right. But those who knew Nottingham were aware that such excavations of the rock were frequent there, and the cellar would be practically useless without ventilation. He found as a fact that there had been communication for 40 years between the plaintiff's cellar and the old well, by means of which the air, some of which was tainted by the brewing materials, passed through the well into the open air, and that the well became the ventilating shaft to the cellar, and that this was known to the defendant and those occupying before him. His Lordship referred to "Bryant v. Lefever" (4, C.P.D., 172, C.A.), "Webb v. Bird" (10 C.B., N.S., 268; 13 C.B., N.S., 841; 31 *L.J.*, C.P., 335), "Chasemore v. Richards" (7 H. of L. Ca., 349), "Gale v. Abbott" (8 *Jur.*, N.S., 987), "Dart v. Auction Mart Company" (L.R. 2, Eq., 238). What legal foundation had been brought forward for the plaintiff's claim? She relied on the Prescription Act and on the lost grant. It was unnecessary to decide the former point, though it would appear to be so from the language of Lord Selborne in "Angus v. Dalton" (6 App. Ca., 470, at p. 798). It was said that the fiction of a lost grant was an unreasonable one, but all civilised countries had acted on it, and where a right had been found to exist for a certain number of years the law ought to presume a legal origin for it (see Mr. Baron Parke's observations in "Bright v. Walker," 1 C.M. and R., 217); and this rule had been acted on in courts of law and by the House of Lords in "Angus v. Dalton." He thought, therefore, the Court had a clear right to presume a lost grant. The plaintiff had properly laid her case, and there would be a verdict for the plaintiff for £10 damages, and an injunction restraining the defendant from doing any of the acts complained of, and as to the counter-claim of the defendant, a verdict for the plaintiff. Mr. Harris, as to costs, said the defendant was anxious to avoid going to law from the very first, and wished to go to arbitration; and he also begged his Lordship to make some suggestion as to the settlement of the action. His Lordship thought the best thing for the parties to do, instead of spending their money in litigation, was to take an architect's opinion as to what should be done, abide by it, and make a smaller outlay in bricks and mortar. Mr. Appleton said the plaintiff's claim was only for nominal damages, and therefore he only craved a verdict for 40s. damages with costs, and also on the counter-claim. This his Lordship granted.

Hedge and Ditch Boundaries.—Fisher v. Henwood.—This case, heard by Mr. Justice A. L. Smith without a jury, arose out of a question of boundary between the owners of adjoining land at Chingford, Essex. The parties had respectively purchased two fields which adjoined, the boundary between which had originally been indicated by a hedge and a ditch on the field of the defendant. That is, the former owner of the defendant's field had, as is usual, dug to the limit of his own land to its uttermost limit, had dug a ditch, and thrown up the earth along the line of boundary, and on that bank set up the hedge, so that the ditch, of course, would be inside his land and would belong to him, and hence the well-established rule of law that when there is a hedge and a ditch along a line of boundary the ditch is taken to belong to the party whose land is on the other side of the hedge. This hedge, however, was old, and though it had been formed of thorn-bushes, it had become nearly destroyed; while, on the other hand, the ditch had become shallowed as well as widened, and so had become nearly so far obliterated that it was now difficult to trace either hedge or ditch, and so disputes arose between the parties as to the real boundary between their fields, and the plaintiff conceived that the defendant had all along the line of the boundary encroached about 2ft. on the land of the plaintiff. In the mean time, the land was thrown into the market for building purposes, and with that view a fence was put up, and hence the present action, in which the plaintiff complained of the defendant for trespassing upon his land, and the defendant denied that he had so encroached. Mr. Justice Smith, in giving judgment on Friday after a two days' trial, said the real value of the land in dispute could not be more than £5. The law was undoubted that where there was a hedge and ditch between two adjoining pieces of land—the land of the party on whose land the hedge abuts goes into the ditch outside the hedge. The reason of this was clear—that the party making the hedge had made it at the uttermost edge of his own land, first digging the ditch and throwing up the bank on which the hedge is set up. His own opinion was that the old hedge and ditch could be traced, for thorn-bushes lasted for generations, and it would be almost impossible to obliterate them. It was not shown who put up the old hedge; but it was shown that the ditch was on the land of the defendant, and it could not be supposed that he would have set up the hedge on the land of the plaintiff, as that would have been a trespass. The hedge had disappeared, and the ditch had become by degrees filled up. But it appeared that the plaintiff had not made out his case, and so judgement would be for the defendant, with costs.

Surveyors' Charges.—Buckland and Garrard v. Pawson and Company.—An action was tried on Thursday and Friday to recover £95 balance, due for work done by the plaintiffs as surveyors. The charges were based on what is known as Ryde's scale. The defendants admitted the services rendered, but said that the charges were not fair and reasonable. The evidence for the plaintiffs was that there was a custom, in the absence of any bargain, to pay according to Ryde's scale, irrespective of difficulty and time occupied. Mr. Asquith, Q.C., for the defendants, cited "Debenham v. King's College, Cambridge," and "Drew v. Josolyne," to show that there was no custom between surveyors and their clients by which the former could base their account on Ryde's scale. Mr. Justice Day, in giving judgment, said the question was whether the plaintiffs were or were not employed upon what was known as Ryde's scale. The evidence in the case was not sufficient to establish a custom, but there was abundant evidence that Ryde's scale was generally known, and was the ordinary mode of remuneration of surveyors. The plaintiffs were employed by Mr. Vigers, who, it was sworn, had employed others and had himself been employed on Ryde's scale. There was overwhelming evidence that the persons whom the defendants intrusted with the duty of employing a surveyor were well acquainted with the custom. There would be judgment for the plaintiffs for the amount claimed.

A new Lady altar has been solemnly blessed in the Church of Our Lady, St. John's Wood. It is constructed entirely of marble and alabaster, and has for its frontal a group, in alto-relievo, of Pentecost. The reredos is of stone and alabaster, deeply recessed into the wall. It has a projecting canopy, supported by detached pillars of polished alabaster, with carved capitals, and is crowned by a moulded and pierced cornice and brattishing. In the projecting cove the dove is carved, surrounded by seven angelic forms, each with six wings. In the centre of the reredos is, enshrined, a copy of the well-known picture of "Our Lady of Good Counsel." The side wall of the chapel is diapered in stonework. The work has been executed by Mr. Anstey from the designs of Mr. S. J. Nicholl, the architect under whose care the restoration of the church after the fire last Christmas has been carried out.

Brunswick Chapel, Leek, was reopened last week after alteration and improvements. The galleries have been lowered *en bloc* 2ft., the front of the orchestra gallery has been extended, and provided with a new coved ceiling, and the pulpit has been replaced by a rostrum, and the whole interior of the chapel redecorated. Messrs. J. and J. Mathews were the contractors for the woodwork and other builders' works, Mr. G. T. Stevenson for the decoration, and Mr. Mark Sutcliff for the heating apparatus, and the architects were Messrs. W. Sugden and Son, of Leek. The chapel was built in 1856 by the father of the Messrs. Mathews to the plans of Mr. Sugden, sen.

Our Office Table.

A SERIES of gifts, the money value of which represents over £200,000, were presented to the city of Manchester, yesterday (Thursday), when the new Whitworth Park and Institute were formally opened. Whitworth Park was formerly known as Potter's Park, and with Grove House, which stands in the ground, was purchased by the residuary legatees of Sir Joseph Whitworth. The park and adjoining land cost £52,000, and in it are to be built, also at the expense of the Whitworth legatees, some art galleries and a technical museum, Grove House being at present used as a temporary museum. Another plot of land is given by the legatees in the city of Manchester, valued at £35,000, on which a technical school is to be erected. The legatees also give £50,000 to be used in the equipment of the Institute. Mr. Oliver Heywood, on behalf of the authorities of the Manchester Jubilee Exhibition of 1887, presented to the Institute the surplus from the Exhibition, amounting to over £40,000, £10,000 of which is to be appropriated to the School of Art, £20,000 to the purchase of works of art, and the remainder to the purposes of a technical school. Mr. William Agnew presented, on behalf of Mr. G. F. Watts, R.A., that artist's well-known picture, "Love and Death," as the first donation towards the furnishing of the Institute. The Duke of Westminster has given a series of large casts of great value, taken directly from the original sculptures in the Galleries at Florence.

THE death is announced of Mr. Robert William Mylne, F.R.S., F.S.A., F.G.S., of Whitehall-place, S.W., which occurred suddenly at his residence, Home Lodge, Great Amwell. Mr. Mylne was a descendant of the Mylnes of Balfargie, who for several generations held in succession the office of Master Mason to the Kings of Scotland; his grandfather, Robert Mylne, was surveyor of St. Paul's Cathedral, and designed the bridge at Blackfriars, removed a quarter of a century since. The deceased held the post of surveyor to the Stationers' Company, having been appointed in succession to his father, Mr. William Chadwell Mylne, C.E., who himself had succeeded his father, Robert Mylne. The Stationers' Company do not intend to appoint a successor at present. He had been a member of the Royal Institute of British Architects for more than half a century, having joined as an Associate in 1839, and became a Fellow ten years later.

A PUBLIC meeting will be held at the town-hall, Kensington, on Wednesday next, at four o'clock in the afternoon, under the presidency of the vicar of the parish, to receive a report of the progress which the system of Registration of Plumbers has made since it was first established in London in 1886, and extended, by the aid of the public authorities, throughout Great Britain and Ireland. Measures will be considered for securing the systematic training and instruction of plumbers' apprentices, and education in the branches of science and technology required by persons engaged in works affecting the sanitary condition of dwelling-houses and other buildings in respect of their water supply and drainage. The attention of Parliament and the public generally will be directed to the anomalous circumstances that, while it has long been the practice to require that medical practitioners, druggists, and others—architects being most anomalously excepted at present—dealing with matters affecting the health of the community should possess sufficient training and prove their qualification before undertaking their duties, there is not at present any corresponding safeguard to the public in respect of plumbers, upon whose efficiency the health of the public is even more largely dependent.

SEVERAL important additions have recently been made to the Italian Renaissance casts of sculpture in the architectural room at South Kensington. Chief among these additions is the great Della Robbia frieze which adorns the façade and sides of the Ospedale del Ceppo at Pistoja, and which was completely illustrated by a series of double-sheet plates in our issues of Jan. 6 and 13, 1888. This, the principal work of Andrea della Robbia's son Giovanni, now reproduced in facsimile at South Kensington, with all its bright scheme of polychromatic decoration, presents in a series of groups of life-size figures the Seven Acts of Mercy, divided by the symbolical figures Faith, Hope, Charity, and Justice. It was executed as lately as 1525, within three years of the death of Giovanni della Robbia. Unfortunately, the South Kensington authorities have not found space for the intervening panels containing the figures of the Virtues. Among other new casts may be noticed those of the "Madonna and Child," by Donatello, from the façade of the Palazzo Panciatichi at Florence, and of two similar marble decorations of great beauty by Benedetto da Majano. There is also a series of reproductions from the bronze tomb of S. Zenobia, completed by Lorenzo Ghiberti in 1446 for the central apsidal chapel of the Duomo at Florence. The cast of the great font at S. Giovanni in Siena has been improved by the gilding of the relief panels and the statuettes by Donatello, Ghiberti, and Giovanni di Turino, which in the original are of gilt bronze. Among new reproductions of French art are the so-called "Beau Christ d'Amiens," and reliefs showing the martyrdom of saints, from Notre Dame at Paris, and wooden doors from S. Maclou at Rouen—a masterpiece of the earlier time of Jean Goujon,—reliefs of the same master from the Fontaine des Innocents and the Hôtel Carnavalet in Paris, and a section of the stone rood screen of Limoges Cathedral, executed in 1543.

Mr. R. J. WITHERS, architect, of 11, Adam-street, Adelphi, has lately patented a tile with a cross nib, or two nibs, *on the soffit*, and is having some manufactured to introduce to architects, who, we think, will find them useful for adoption. The number of tiles on roofs—and more particularly hanging tiles on walls—that drop off after a few years' exposure, have led Mr. Withers to try and find out some mode of easily replacing same. By the use of his patented tiles he hopes to find he has succeeded, more especially if they can be, as he thinks, manufactured at but a slight increase in cost over the ordinary nib tile. The tiles can be made to any gauge or lap; no lines or setting-out are needed; the gauge of tiling is assured; they are equally suitable to boards or battens; increased strength is assured; they are easy to fix and replace, and certainly invaluable as hanging tiles.

WATER SUPPLY AND SANITARY MATTERS.

HAYES DRAINAGE.—At the last meeting of the Uxbridge Union Rural Sanitary Authority, the Board adopted a scheme for the drainage of Hayes. The sewage is to be precipitated in tanks with ferrous carbon, and the effluent passed through "polarite" filter beds. The cost of the work is estimated at £10,500. Mr. F. Beesley, of Westminster, is the engineer.

MOLD SEWERAGE.—Mr. W. H. Radford, C.E., of Nottingham, has been requested by the Mold local board to draw out a scheme for the sewage disposal of the whole town of Mold, and for the sewerage of a portion of it. On Monday Mr. Radford met the members of the board, and inspected the whole of the district; and he will take levels and prepare a scheme forthwith.

CHIPS.

A branch bank for the Manchester and County Bank is now being erected at Withington. The architects are Messrs. Mills and Murgatroyd, Manchester, and the builder is Mr. Robinson, Hyde. The carving is being executed by Messrs. Howarth Bros., of Manchester.

The portrait of Professor Playfair, which was purchased at the Stoner sale of pictures for 210 guineas, by Mr. Agnew, is to be placed in the Scottish National Gallery at Edinburgh.

The Birmingham City Council decided on Tuesday to raise the salary of Mr. J. T. Buckley, road surveyor, from £400 to £500 per annum.

A new branch bank is to be built for the Birmingham and Midland Banking Co., situate in Kirkgate, Leeds, from the designs of Mr. William Bakewell, architect, Leeds.

The annual meeting of the Royal Archæological Institute will be held at Gloucester between the 12th and 19th of next month.

At the meeting of the County Council for Surrey held at the Sessions House, Newington, on Tuesday last, the sketch plans for the county buildings to be erected at Kingston were approved, and the architect, Mr. C. H. Howell, was instructed to prepare the necessary working drawings and specification. The design comprises a hall, council chamber, a court for Quarter Sessions, committee-rooms, and other accommodation required for the business of the council and of the court.

Trade News.

WAGES MOVEMENTS.

EXETER.—On Friday last the Carpenters' and Joiners' Strike Committee called out all the men in the trade. In answer to the summons about 70 men came out. There are still others at work, but there are now on strike 154 men, society and non-society. About 100 men in a batch during the day visited various firms in order to prevail upon their fellow workmen to drop their work and join the strikers. The Strike Committee have signified their intention to form a Co-operative Building Society in the city, the profits to be equally divided among the men.

LIVERPOOL.—At a joint meeting of the members of the Alliance Association and Amalgamated Union of Cabinetmakers held recently, it was resolved "to solicit the employers for an advance of 2s. per week in wages, and to be paid extra for overtime, as in the case of artisans generally." With respect to the terms of advance it was decided: "To date from August 1; that the wages of cabinet-makers, chairmakers, carvers, turners, and cabinet machinists be advanced 2s. per week all round, all time to be paid by the hour, and all lump work to be abolished. The terms were submitted on Monday to the principal employers in Liverpool, the deputation explaining that it is 16 years since they asked the employers of Liverpool for an advance of wages, which they generously granted on that occasion. A meeting of the joint committees of the Cabinetmakers' Societies, under the presidency of Mr. Edward Jones, was held in the evening, when the deputation reported that many of the firms had intimated their willingness to comply with the demands of the men, but others would only concede part of the demands.

MEDWAY CEMENT WORKERS.—A strike of cement labourers occurred on Tuesday at Cliffe factories, near Rochester, several hundred men being out. Towards evening the strikers became very turbulent, and several conflicts occurred between sections of the union and non-union men.

BARNSLEY.—On Thursday, the 10th inst., a friendly conference of the representatives of the master masons and the men took place at the King's Head Hotel, Barnsley, and resulted in the dispute, so far as the masons are concerned, being settled. Through the intervention of Mr. Councillor Sykes, who saw the leaders on both sides, the Mayor (Ald. Wood) and Mr. Ald. Marsden, as President of the Chamber of Commerce, sat and heard the matters in dispute argued by two representatives—Messrs. Taylor and Lawton—for the builders, and Messrs. Pashley and Dickenson for the men. The arbitrators advised the builders to concede the halfpenny per hour, and they agreed to do so, making the standard rate 8½d. per hour. The men wished to introduce a new rule, that no employers should be allowed to sub-let any mason work that may have been contracted for in the district, except hammer dressing. This was objected to, and ultimately withdrawn. The dispute is therefore settled.

Holloway's Ointment.—This cooling Ointment perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest Quinsy, relaxed tonsils, sore throat, swollen glands, ordinary catarrh, and bronchitis may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment.

CRAIGLEITH STONE.
UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear.
VERY HARD, and NEVER WEARS SLIPPERY
SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W.

DOULTING FREESTONE.
THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.
THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.
Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful COLOUR of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent.—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

FRIDAY, JULY 25, 1890.

ARCHITECTS' AND SURVEYORS' FEES.

THE frequent repetition of questions as to what is a reasonable charge to make for particular professional services is the best evidence of the variety and miscellaneous character of them. Though the architect's schedule of charges is pretty well known for building operations of an ordinary description, it is far otherwise with regard to a number of duties which fall to his lot. Architecture pure and simple forms, after all, only a portion, and sometimes a rather small one, of the practitioner's labour. While one client seeks the architect's skill in the design of a building, a dozen or more come to him for assistance in some business of a general kind which has no more to do with the art than book-keeping has to do with authorship. What connection, for example, there can possibly be between preparing designs for a building, and assessing the value of houses and dilapidations, we can hardly imagine; there is certainly very little between designing and measuring artificers' work, or doing the hundred-and-one things which more properly belong to the surveyor, valuer, or house-agent. Many people imagine that an architect should understand all these duties, and he certainly is expected to be able to give advice and to make valuations and reports upon a number of things which would be better done by the surveyor and the engineer. Increasing competition has forced the architect to combine the three professions in many cases, just as there are surveyors and estate agents who undertake to prepare designs for buildings. The intermixture of duties has added to the difficulty in the way of a general and uniform code of charges. If architects were to confine themselves to works of construction and formation, and surveyors to duties of measurement, valuation, and agency, a more just and defined class of services would be the result. As it is, however, all that pertains to buildings and property is now considered to be within the province of the architect.

With this wider range of duties it becomes necessary to agree to a scale of charges and commissions, and, as a first condition, to establish a reasonable basis of calculation. Buildings, as we have suggested before, ought to be divided into classes, depending on the cost, complexity of structure, the amount of artistic ability required, and the skilled labour necessary. The customary charges based on cost are agreed by all to be unsatisfactory. The traditional 5 per cent. is only a fair and equitable commission for buildings of ordinary kind costing over £1,000, and is totally inadequate for the designs of a decorative character, or for things, like a reredos, a pulpit, or stained glass. We do not propose now to enter into the question as it relates to works of this class, but to refer to those of a more general kind. The cost of a thing is not always a fair criterion of the skill required in its design. A surface may be studded with jewels, but the artistic ability spent on the design may be trifling; on the other hand, a great deal of original thought and study may be necessary in devising a scheme of earthwork, as in the laying out of a garden, the cost of which may be very small, and accomplished by the aid of unskilled labour. In neither case the expenditure would not be a reasonable basis to charge upon. The amount of time expended and skill actually bestowed on each design seem to be the only proper measure of the artist's labour; but this does not admit of easy calculation, except as a matter of time, which will differ according to the ability and aptitude of each artist, as one man may take double or treble the time of another in working out the same problem. Therefore it appears to be desirable to fix upon some arbitrary rate or percentage that will be found on an average of conditions to remunerate. To find such an average rate is no doubt difficult, and is one reason why there is such a diversity of opinion. One architect would think his services well-paid at 7 per cent.; another, very badly paid at 10 per cent. A committee of professional men could, in an hour or two, devise a rate for specialised designs that would satisfy the profession. Till this is done and established architects must be contented to charge for designs of an exceptionally artistic kind and intricacy, by the time engaged upon them. But the "time" basis, as we have pointed out above, does not give always the desired result. A specialist in stained glass would prepare a design for a window in much shorter time than a man who had little experience or taste for such work, and, according to "time" employed, would charge less than the latter. This would neither be just nor satisfactory to the true artist.

Extraordinary arrangements are made by some architects and their employers, which serve to show the unequal rating for professional service. The latest comes from a Warwickshire School Board. The Board paid £50 for the designs for new schools for 300 pupils, which were found to be inadequate in respect of ventilation and heating. Their own officer was requested to revise and amend the plans, and to supervise their execution, at a percentage of 5 per cent., and he was to give the Board twenty guineas towards the premium they had paid—a very curious arrangement, unless the plans were a repeat, and had been used for other schools. The practice of charging by "scales," such as the Institute schedule or Ryde's scale, is largely followed; but the employers, we are inclined to think, obtain rather different values or services for the same rate. The other day an action was brought by a firm of surveyors to recover a balance, the charge being based on Ryde's scale. The defendants said the charges were not fair and reasonable; but the plaintiffs by evidence contended that there was a custom, in the absence of any bargain, to charge according to the scale. Of course, the question was whether the defendants were aware of the scale. Mr. Justice Day said the evidence was not sufficient to establish a custom, but there was evidence that Ryde's scale was generally known and that the defendants who employed the surveyors were acquainted with the custom, therefore judgment was given for the plaintiffs for the amount. But a scale, although it may be generally known by the profession, may not be known to the employer, and therefore it has no binding effect in law unless they are made part of the agreement between the professional man and his client. When works are not carried out, the remuneration is often made by the day, an architect or surveyor charging what he pleases, according to his reputation; but the client is not unnaturally dissatisfied if he has not been a party to the arrangement. A reasonable remuneration only will be awarded by the Court, and will be a question for judge and jury. Very often we find a client, while admitting the rate per day, dissatisfied for the time charged for. This can only be settled by evidence to show that the time is reasonable for the work.

The fees charged by engineers have not been fixed by schedule. Probably the reason is, that a scale would not be satisfactory to all alike—those who are eminent and those who have little practice. How much more does this reason apply to the architectural profession, where the degree of eminence depends so much on artistic ability and position? A scale may be desirable for the rank and file of the profession; but for those who have large practices and can command higher fees, it should not, nor indeed can be, made binding. The charges for making plans of estates with a view to laying it out for building are, from the nature of the case, very various and uncertain. Correspondents are continually asking for some rule. A plan of a building estate may be a matter requiring very little skill, or it may demand a great amount of thought and experience. No fixed schedule is possible. The time and labour expended on it are the only means of estimating a fair charge. Some surveyors take the number of plots, others make their charge as a commission on the estimated expenditure of laying out, which latter appears to be a more reasonable basis. The percentage would not be too high if taken at 2½ per cent. on the cost of formation of roads, fencing, drainage, and other works in some cases; for supervising the buildings during their erection and certifying the lease an extra percentage of half per cent. to 1 per cent. would be necessary. On very extensive estates a less percentage on cost would be fair. For a certain class of work there is no rule or rate, and the surveyor or engineer has to adopt a scale of his own, or charge by time and labour. For example, it may be for planning and constructing a road, preparing levels, sections, plans, and quantities necessary for carrying it out. In such a case the fee ought to depend on the actual labour, and the cost of executing the work might be taken, upon which to charge the percentage, which would depend on the length of the road. For a work requiring a number of levels to be taken, embankments, cuttings, and draining, the percentage should be higher than for a road made through level land, which requires merely a plan and section. The formation of a lake or any earthwork should be remunerated for in the same manner—namely, the skill and labour required in designing the work. It would be desirable to fix a scale of charges for works of this miscellaneous character. The time actually occupied by an experienced engineer in conducting a given work would be the fairest mode of ascertaining an equitable charge. Having arrived at a fair remuneration by this means, it would be easy to find out what a percentage this sum would be on the actual cost, and for similar undertakings a like commission could be charged. Approximate scales for other works could be formed in this manner, and a scale after all is more satisfactory to the employer, who likes to know beforehand what the fees are. Professional charges made by time or per day for works of this description are uncertain, and cannot be estimated till the work is completed.

BERMONDSEY FREE LIBRARY COMPETITION.

NO less than 53 designs have been sent in for the erection of a public library for the parish of Bermondsey, and are on view in the Town Hall. The design submitted by Mr. John Johnson, of Queen Victoria-street, has been selected. The first premium has been awarded to Mr. W. L. Bernard, of Bristol; the second to Mr. H. T. Hare, of Lombard-street, E.C.; and the third premium to Mr. J. B. Broadbent, of Manchester. We are compelled to confine our remarks to the three first designs. The selected design bears the motto "Light," which essential has been fairly considered. The site next the Town Hall necessitated a skilful distribution of the main departments, as the ancient lights on the western side had to be respected, though the author has

brought his building close up to the boundary. Mr. Johnson has placed his newsroom and magazine-room on the right hand side of entrance, separated from each other by a glazed screen. The former fronts Spa-road, and is 32ft. 6in. by 22ft., the latter of the same dimensions. The librarian's office is on the left side. An entrance of 15ft. in width leads into a spacious hall 37ft. by 15ft., having the main stairs on the left side. Arranged axially with the hall is the lending-library, square on plan, in the rear, 41ft. 6in. by 40ft., with counter for borrowers the whole width of hall, projecting into the library. Windows are placed on all three walls, and the book-cases are arranged transversely from the piers, and longitudinally down the centre of room rows of piers on either side divide the area into a centre and aisles. A librarian's entrance is on the east side. The first floor plan shows the reference-library, 41ft. by 40ft., over the lending-library behind, divided by bays with four corner piers, which carry the domical ceiling, which has a ventilating cupola in the centre. Over the news and magazine rooms on the side is a book-store, 45ft. 6in. by 24ft.; a ladies' reading room, 22ft. by 16ft., is over the entrance, and a librarian's drawing-room over his office. On the second floor are the librarian's private apartments; in front and on the basement are additional book-stores, a book-binder's room, and heating apparatus. Light is partially obtained on the ground floor by screens round the hall. A skylight along the Town Hall side lights the news-room on the ground floor. The reference library is a domical apartment lighted chiefly from the top, and the yard and area on the left side afford light to the lower department. The elevation towards Spa-road is three-storied, Renaissance in character, and of red brick and stone or terracotta, with a high roof, end pavilions, and a lofty centre carried up as a flèche.

The first premiated design by Mr. Bernard, with motto triangle in circle, is a more elaborate design in the same style, shown by a pen-and-ink perspective, with a recessed centre and arcade, and another forming a private entrance on the west side. A centre public entrance, with inner hall 18ft. square, has the staircase, and beyond it a square inclosure for borrowers, with issue and return desks, taken out of the lending-library behind, which is 51ft. 9in. by 31ft. 6in., and has a raised floor to allow of efficient supervision of the news and magazine-rooms; it is divided into three unequal parts by two rows of columns, the shelves or cases being arranged transversely, those in the aisles being lighted by the side windows. Shelf accommodation is provided for 22,000 vols., in cases 6ft. 6in. high, within easy reach. The room has plenty of light from the end and sides. The news-room is 27ft. 3in. by 38ft. 4in., and has 56 stands for reading on the left side of hall; the magazine-room on the other side, 27ft. 6in. by 22ft., lighted on two sides. The first floor has the reference library above the lending library 48ft. by 31ft. 6in., with six side-bays of shelves on each side, and holds 8,000 vols. The book-store is over the newsroom; a ladies' reading-room over the magazine-room with a private lobby, lavatory, &c., well lighted by side lanterns. The reference-library has an arched ceiling over the centre portion, and is lighted by side lights through it as well as at the side. A section shows openings into a ventilating trunk, which leads to a cupola as an exhaust. The librarian's private rooms are ranged along the front on the next floor. A book-store and binding department are in the basement. The cost is put at from £5,500 to £6,000.

The second premiated design, with Renaissance features, red brick and stone ("Q" in a circle) has a compactly-grouped plan. Round a centre hall are grouped the lending-library, 50ft. by 30ft., in rear; news-rooms, 37ft. by 21ft. 6in., on west side; a magazine-room, 25ft. by 22ft. 6in.; and a ladies' room, 24ft. by 14ft., on either side of entrance. The librarian can command the departments, being placed between the lending-library and magazine-room on the left side. The first-floor plan places the reference-library, 50ft. by 30ft., over the lending department, the book-store over news and ladies' rooms, with those of the librarian on the other side. A gallery surrounds the reference-library, and the lighting and ventilation have been considered. The author provides for 30,000 volumes in lending-library, and for 68 readers and space for 8,640 volumes on floor, and 9,850 in gallery in the reference-library, the space being calculated at 8 vols. to a square foot. It is top-lighted, has a staff stairs, and open-timbered roof. Heating by the small-bore hot-water system with coils is provided. The cost is estimated at £4,660.

"Spa," by Mr. Cole A. Adams, has a well-studied arrangement, but the entrance is contracted. A large lending-library, 47ft. by 32ft., occupies the centre, lighted partly through a well in the reference library above, and also by a skylight at the side. The news and magazine rooms are on the right-hand side of hall, each about 26ft. square, the ladies' room on left of entrance; a borrower's lobby, 24ft. by 10ft., is top-lighted. A book-store in the rear is provided. The reference-library, 55ft. 9in. by 31ft. 9in., is on the first floor, in centre librarian's office, and parlour in front, and a book-store behind. Skylights at side and rear admit the light to the lower rooms, which are built to the full limits of land at the side. The elevation is somewhat too villa-like.

"Book Worm" is like many in general arrangement, the magazine and news-rooms in front with book-store above. The details are unsatisfactorily worked out. A bold design is sent in for the front. Among the clever plans we may notice "Librarian," in which the lending department, 45ft. by 35ft., is transversely placed at the back with a good area for light in rear; the hall with counter is in the centre at the side. The librarian's office, the news, and magazine-rooms are in front. The author is Mr. Edwd. W. Mountford. The elevation, an elaborately detailed design of Renaissance, accompanies it. "Red Crosse" has also a good plan, with large centre hall and a straight counter across end of hall for borrowers, 29ft. 6in., the whole width of lending-library in the rear. The Bermondsey coat of arms is the motto of another well-devised arrangement, having a good public space at the end of lending-library. "Onward" is a clever design in a Queen Anne style, with a well-drawn elevation. The entrance is rather contracted. "Vi et Arte" is artistic, of Late French Gothic features; the entrance hall is small, and lighting is not good. "Streona" is worth notice: the departments are well placed within the boundaries, enabling light to be obtained to all of them. The style is of Late Gothic character. "Minerva" has a good hall and public space, with particularly glaring red elevations. "Read on this Book" shows also a well-devised space for borrowers taken out of lending-library, which is on right of entrance instead of in the rear. "Lacon" is compact; "Tor" has a clever sketch, in sepia, of 17th-century features well handled, with a good hall and space for borrowers, and the lighting is efficient, which is more than can be said for many. "Lux" and "Simplex" are also cleverly thought out; "Economy" has a symmetrical plan, with central hall and effective features. "Kent" has a well-arranged public department; the hall is large, and the rooms well grouped; "Liber" also has a good hall and lobby arrangement, and is well lighted. "Τάνταλος" is a well-drawn set of plans; but the plan is rather awkward, and glazed screens are largely used. "Inter Alia" has the lending-library in front with book-store over reference-library and news-room. "Ad Rem" has one lending-library at side of hall, ladies and librarian's rooms on left side.

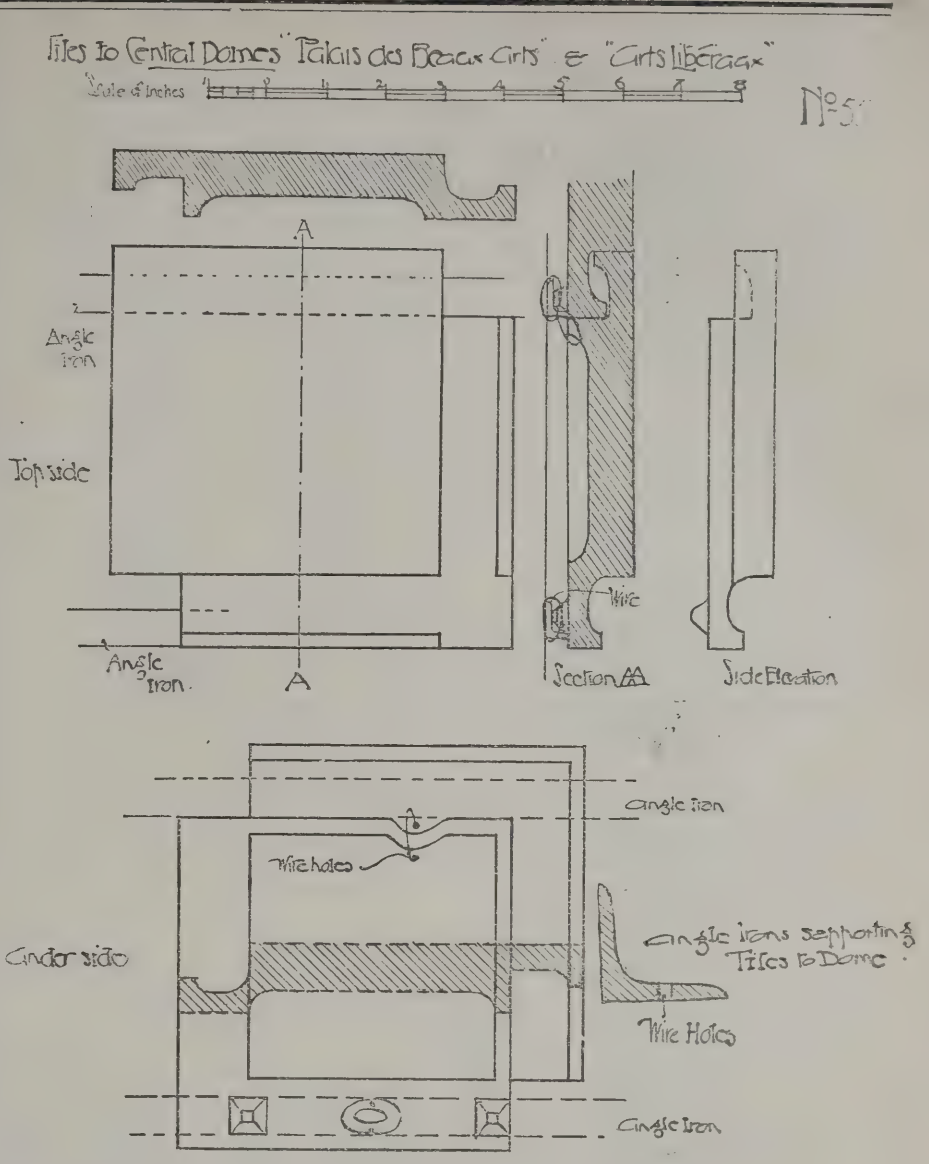
Designs of more or less merit are those of "Sapientia Fons Vitæ," "Pascal," "An Idea," "Porte Bonheur," "Utility," "Ad Unguem," "Light and Air," "Good Plans instead of Showy Perspectives."

THE MANCHESTER BUILDING BY-LAWS.

THE long-looked-for code of builders' by-laws for Manchester was confirmed by the Local Government Board and came into operation in May last. Previously the building regulations for Manchester were a patchwork of many local acts. The Manchester Improvement Acts of 1865 and 1869 and a provisional order gave powers to the corporation to make by-laws, and the code now in force, and of which code we have a copy before us, may be said to be fairly perfect. The Model By-laws relating to new streets and buildings have been in the main followed. Thus, with respect to the construction of new streets, the least width is that given by the latter case—namely, 36ft.; certainly somewhat narrow, and the provision further states that such street shall have at one end "an entrance of a width equal to the width of such street, and open from the ground upwards. A new back street is to be at least 9ft. in width uninterrupted for its entire length." Adverting now, with brevity, to the main provisions in the clauses affecting new buildings, we find the model regulations generally followed. Half-timber walls are provided for, and the clause runs word for word according to the prescribed form as follows:—"Provided always, firstly, that where a new building intended for use as a dwelling-house shall be distant not less than 15ft. from any adjoining building not being in the same curtilage, the person erecting such new building may construct its external walls of timber-framing in accordance with the following regulations." Then the instructions follow as in the model code requiring the spaces between the timbers to be filled in with brickwork *or other non-combustible materials* with a thickness of at least half a brick at the back of every timber, &c. The italics are new, and allow for the use of concrete, rough-cast, or other material as a filling—certainly an important addition. Then follow the clauses providing for the materials for cross walls, which appear to have nothing new. Coming to cavity walls the new code provides for double walls to the stories of dwelling-houses below the level of the ground, the intervening cavity to be 2in. extending from the base of walls to the surface of ground. The original rule made the cavity 2½in., and continued this hollow to a height of 6in. above the exterior surface of ground, a very necessary precaution. The walls are to be tied by galvanised iron ties placed not exceeding 3ft. horizontally and 18in. vertically, a damp-course of 4lb. sheet lead, asphalte ½in. thick, or slates laid in cement being inserted as a damp-course.

The clauses referring to the heights of stories and the thickness of external and party-walls are apparently the same as those prescribed by the Local Government Board. Thus we find the same definition of the height of stories. It is unfortunate that the framers of the Manchester By-laws should not have set the example of amending these definitions and measurements of heights, and especially have defined more clearly what the "topmost story" is upon which all the after rules as to thickness depend. The schedule of thick-

nesses for walls of domestic buildings has not been altered; but the awkward phrase "thirteen and a half inches" thick has been substituted by the more practically understood thickness of a brick-and-a-half wall—namely, "fourteen inches" throughout the schedule. Instead also of "twenty-six inches," "twenty-seven" inches has been substituted, also "twenty-two-and-a-half inches" for "twenty-two inches." For warehouse walls the rules follow the Model By-laws. New public buildings or warehouses are to have the party-walls carried up 9in. at the least in thickness above the roof flat or gutter of the highest adjoining building, to a height that will give 3ft. measured at right angles to the slope of roof, or above the highest part of flat or gutter. Where the woodwork of the roof projects beyond the face of such buildings, the party-walls are to be corbelled out to the full extent or projection, and be carried up 9in. at least in thickness to such a height as will give a distance of 3ft. at right angles to the slope of roof. Party-walls of domestic buildings to be carried up at least as high as the under side of the slates, the same to be solidly bedded in mortar or cement on the top of wall. The parapets to external walls of public buildings, warehouses, or domestic buildings used partly as shops, which are over 30ft. in height, and within 15ft. from any other building, to be carried up so as to form a parapet 1ft. at least above the highest part of roof or gutter.



Floor and ceiling joists of domestic buildings are regulated according to a scale of scantlings. With respect to the space about buildings to secure circulation of air, the new by-laws provide in front of dwelling-houses 36ft. at the least to the opposite boundary or side of street, instead of the prescribed 24ft. of the original code, except in cases where the street is of less width than 36ft., when 24ft. is to be deemed sufficient. The space in the rear is regulated by the old rule, which prescribes a distance of 15ft. at the least for dwellings 15ft. high, of 20ft. for houses 25ft. high, and 25ft. at least for houses of 35ft. or above that in height. These are certainly small allowances of area.

As regards drainage, the provisions are more satisfactory. The lowest stories of new buildings are to be at such a level as will allow of a drain sufficient for the requirements, to empty into a sewer "at a point in the upper half-diameter of such sewer." Drains under buildings to be laid in the ground with at least 12in. between the top of drain at its highest point and the surface of ground, such drains to be laid in straight lines, and to be completely bedded in concrete 6in. thick all round. The drain to be ventilated at each end, inlets to be trapped, a suitable trap to be introduced in that communicating with any sewer, at a point as far as possible from such building. Amongst other provisions we find that two (at least) untrapped openings to the drains are to be introduced, according to one or two arrangements which are described in the Model By-laws. These are the main provisions of the new code, to which we refer our readers.

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—VIII.

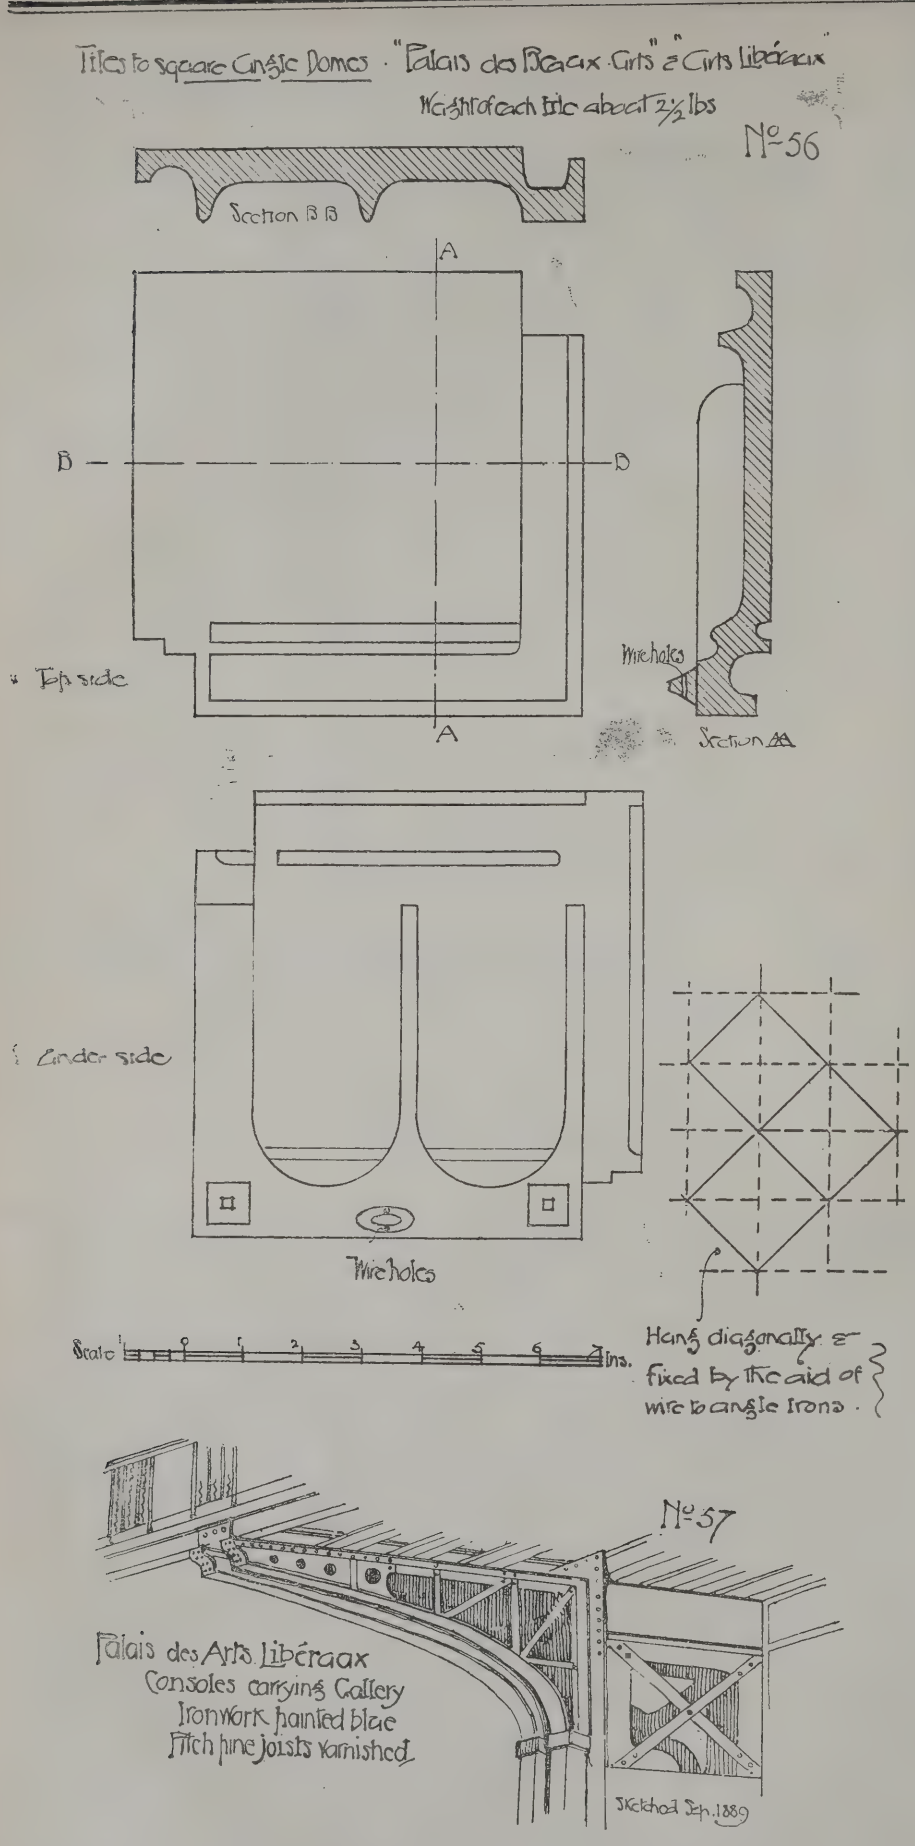
By BANISTER FLETCHER, JUN., A.R.I.B.A.

THE domes to the "Palais des Beaux Arts" and of the "Arts Libéraux" are similar and symmetrically placed. They differ on plan to this extent, that the "Beaux-Arts" dome has a wide gallery at the first-floor level, which is approached by staircases at the four corners leading from under the dome. The domes rest on four great standards of lattice-work framing, from which spring the Tudor arches in lattice work supporting the dome itself. The tops of the standards are connected with semicircular iron lattice arches at the back. The staircases and

gallery to the "Beaux-Arts" dome are most satisfactory in their outline and general proportions, the arches in stonework supporting them, following the rake of the staircase, and the central arch being formed of a low elliptical arch. The iron balustrading is extremely rich in design. The dome itself is framed by means of 12 girders, with a curve struck from six centres in such a way that the intrados of each is proximately elliptical. The girders are connected at their top by a circular girder 30ft. in diameter, above which is the glass lighting the dome. At the base of the drum of the dome the 12 girders are connected and held in position by a circular belt of framing, which also carries the attic wall and the ornamental vases in glazed faïence. Between this upper and lower set of circular girders, four rings of circular purlins are introduced, which take the intermediate rafters, &c., and enamelled tiling of the roof covering. The dome itself is 196ft. 10in. high from the ground, and 98ft. 4in. above the top of the gallery roof.

The diameter of the domes between the standards supporting them is 32 mètres, or 105ft., and they are covered at their lower portions up to the glass with glazed tiles of a special design, because there is no overlapping, the tiles presenting a level face. I give some drawings of these (No. 55 and 56) made from the models of the tiles themselves in M. Formigé's office. These are made by M. Müller, who also made the terra-cotta to the buildings. Several specimens were tried in the endeavour to get these tiles watertight, and even now M. Formigé told me they are not watertight. The domes are covered with zinc, underneath the tiles, in order to further protect the inside.

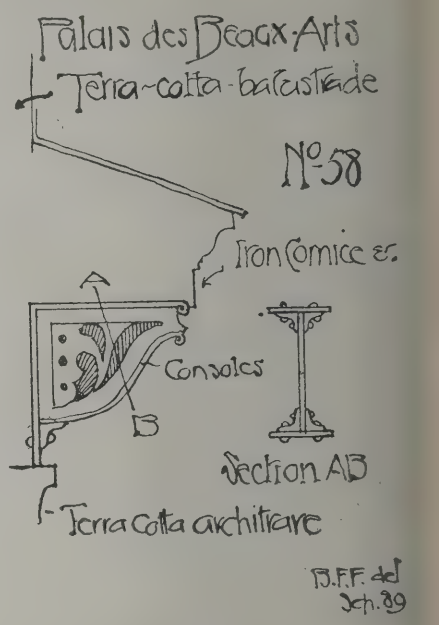
The dome is also lighted by the circular windows at its base, formed with voussoirs in blue and white glazed terracotta. The tiles externally are very happy in effect, the dome being divided vertically into 12 divisions, thus emphasising every alternate girder by tiled divisions in gold. The wide divisions between these have a white ground with R.F. in the centre in gold on a turquoise blue ground.



There are 24 large vases in glazed terracotta at the base of the dome, one at the bottom of each girder. These vases are 10ft. high.

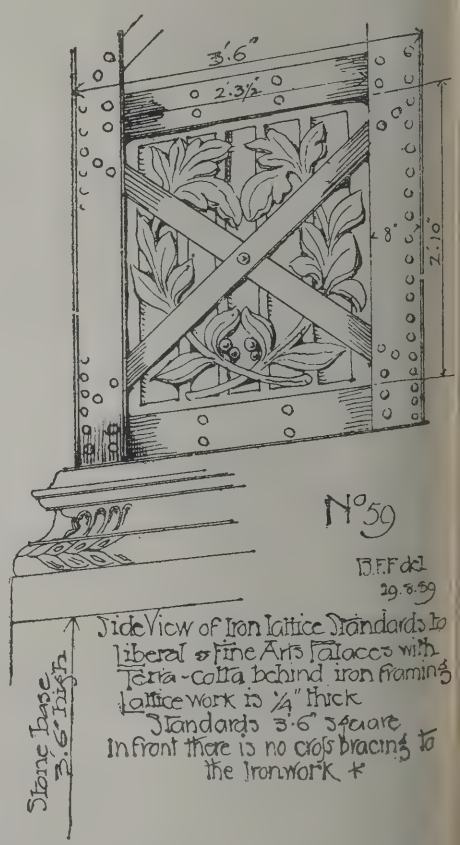
The strains allowed by M. Contamin were 57·1lb. per square foot to the glazed portion of the dome, and 94lb. per square foot in the tiled portion, exclusive of the horizontal action of the wind, which is taken at 80·6lb. per square foot.

The two sheets of drawings (55 and 56) are details half full-size of tiles to the main circular domes and the square angle domes; they rest on angle irons, and are secured to these by wire passing through specially prepared holes.



The side aisles are in two heights, and at the level of the first floor in the Liberal Arts Gallery, there is a gallery, No. 57, supported on iron cantilevers projecting 16ft. 5in. into the nave. This gallery is connected at different points with the first floor of the "Histoire du Travail." (There is no gallery to Fine Arts Palace). Details are given of this projecting gallery in the plate of details of the truss, and the above sketch will give an idea of the general arrangement; it is riveted to the back of the main trusses. Iron joists of sheet and angle irons rest on the top of these cantilevers, and these in turn support the wooden joists which carry the floor. The ironwork is painted grey-blue, and the joists are pitch-pine, varnished, which give the gallery an appearance of extreme lightness and grace from below.

The total height of the side aisles is 65ft.; they are covered with a pitched roof having a tie-rod. The principals of this roof are about 30ft. apart, or half the distance between the great principals of the nave. They rest on a bracket riveted to the back of the main principals of the nave and

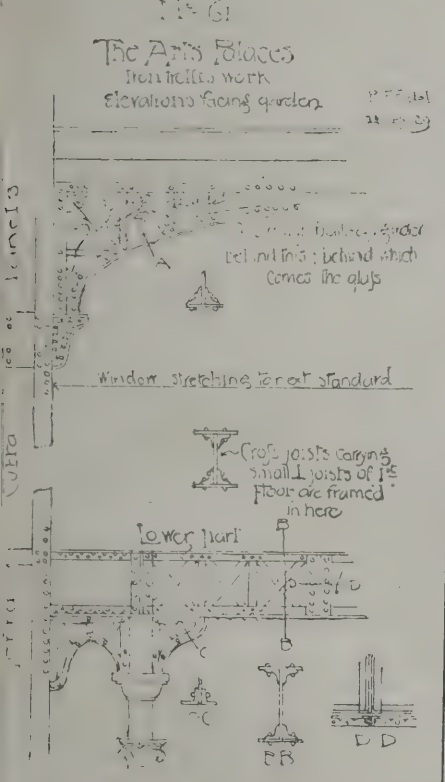


intermediately on lattice columns 1ft. 11in. by 2ft. 7in., which rise as high as the gutter itself.

Externally.—The roof principals to the side aisles rest on the outside on iron lattice-work standards filled in with light Venetian red terra-cotta. These standards, as far as the ironwork is concerned, are painted grey-blue, which goes very well with the terracotta (No. 59 and 60). They are connected longitudinally at the first-floor level by a lattice-work girder (No. 61), and again under the main cornice by trellis-work arches, which take off the sharp junction of the angles. These arches (No. 61) are double, one behind the other; they are, however, somewhat spoiled by the fillings in to the spandrels of these arches, which are in rather coarse naturalesque foliage. The glass to the windows comes behind the back arch, which gives a deep shadow. On each side of these standards, at about 2ft. distance, are cast-iron ornamental circular columns (No. 61) resting on a stone base, which carry the light lattice girders connecting the standards, which girders in their turn carry the cross girders supporting the floor, which are supported at the other end by the brick wall separating the

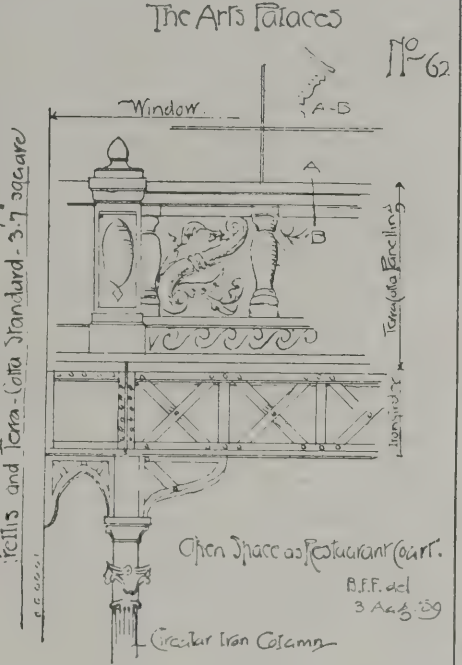
main nave from the aisles. These girders are also supported in the middle by standards, the secondary girders supporting the floor, consisting of three iron girders, carrying the brick arches, which are finished in white plaster underneath.

The *Façades* to "Palais des Beaux-Arts," and the "Arts Libéraux," are probably one of the most satisfactory parts of the Exhibition from an architectural point of view. The colour of the terracotta is a bright Venetian red, and the combination of this colour with grey-blue of the



ironwork is thoroughly harmonious. The standards to the façade are 3ft. 7in. square (No. 59) and rest on a stone base, and are about 25ft. apart, and have on each of them the circular cast-iron columns described above; helping to carry the connecting lattice-work girder. Between the standards and resting on the lattice-work

girders to first floor is a close terracotta balustrading (No. 62); above this, for the whole distance between the piers, are the large windows lighting the first-floor galleries, until the segmental trellis arches are reached connecting the standards: these are riveted to the sides of the standards, resting on small iron corbels, and carry the architrave, frieze, and



cornice in terracotta, and, above this, terracotta balustrading. The iron cornice (No. 58) painted blue, breaks round the piers, and is somewhat original, having consoles formed of sheet and angle irons, the sheet-iron being perforated. The piers themselves are continued up through the cornice, and finished with a flag-hole. Immediately under the cornice the standards have glazed faïence with shield.

The main central entrances to both the palaces are built in terracotta, with no ironwork, in deep

narrow courses, and the spandrels to the semicircular arches composing the entrances are filled in with terracotta panels in relief. The two small quadrangular domes which occur at each end of the palace nearest to the Seine are also covered with glazed tiles, the details of which are given further back; the key-note is blue and yellow on a white ground. The main central entrances are flanked with a square projection, which is taken up above the roof, and covered with an open arched cupola. In a band above the semicircular arches, and over the keystone of each arch, is a figure in terracotta, which are connected by deep swags with the adjoining figures; above this group is a corbelled cornice. These entrance vestibules are roofed with glass back to the central nave, from which spring glass-fronted gable carried back to the circular drum of the dome. The spandrels to the dome is covered by a sloping roof. On each of the central feature to the façades there are eight bays between the lattice-work standards, and these are bounded at the Seine end by the square domes mentioned above, and at the other end by the galleries Rapp or Desaix.

The Fine Arts Palace differs in only a few respects from the Liberal Arts Palace. There is no projecting balcony to the nave at the first-floor level, and there is a staircase in each angle

under the Beaux-Arts dome. This staircase has been described under the dome, also the difference consisting in the gallery to the first floor in the dome.

The entrance from the central garden is similar to the "Arts-Libérateux," except that the piers carrying the arches are ornamented with motifs in glazed faïence instead of the two statues representing Commerce and Industry, which appear in the entrance to the "Palais des Arts Libéraux."

PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—LXVII.

CONTEMPORARY BRITISH MANUFACTURERS AND ART-WORKERS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

WE have already given three double pages of portraits under this series, and to-day we give the fourth plate, which commences with Mr. J. Westwood.

Mr. Joseph Westwood was born in 1844. He was educated at a private school at Dulwich. After leaving school, he went through his father's workshops, then to the drawing office, which eventually he had charge of, as well as the management of his father's works, this taking up some 20 years of his life. He is now proprietor of the firm of Joseph Westwood and Co., engineers and contractors, of Napier Yard, Millwall. He is also the proprietor and manufacturer of the well-known and universally - appreciated "Hawksley's Patent Treads," which are in use all over the kingdom, and are admittedly the best and most durable tread or step yet invented. He was elected some ten years ago a member of the Institution of Civil Engineers, is also a member of the Institution of Mechanical Engineers, a member of the Institution of Naval Architects, a life member of the Society of Engineers, Fellow of the Society of Arts, member of the British Archæological Association, &c.

Alexander Rottmann, founder of the well-known house of Rottmann, Strome and Co., London, as manufacturers and importers of Japanese leather papers, was born in London in 1858. His father was of the old and renowned firm of Gebhardt, Rottmann, and Co., of Lawrence-lane, Cheapside, E.C., who were the first to import borders and French paperhangings to this country some 30 to 40 years ago. Mr. Alex. Rottmann when quite young left England for Germany, and up to the age of 19 studied polytechnic subjects at Cologne, on the Rhine, where he passed the University examinations, with full intention of becoming an architect. He made designing and drawing his special study, through which he acquired great taste for ornamental decoration. Returning to London, he changed his mind regarding an architect's profession, and entered a mercantile career, where he became acquainted with the Japanese decorative trade at the house of Londos and Co., at that time the first Japanese and Oriental house. Coming across Japanese oil papers, which then were only made in grotesque designs, and used for fancy and native use, he could see a future for leather papers if properly developed and suited to decorative requirements, as far as colour and designs were concerned. In 1882 he started for Yokohama, and established the firm of A. Rottmann and Co., which soon after changed to the present firm of Rottmann, Strome, and Co. Mr. Rottmann left again for Europe, and established a central warehouse in St. Mary-Axe, London, E.C., for the sales of European requirements, after which he found it necessary to revisit Japan for further improvements of the materials, so in 1884 he made his second trip to Japan for this purpose, returning to England in the beginning of 1885. Seeing that the papers could be used to a greater extent if the designs of various periods were adapted and colours improved, Mr. Rottmann travelled throughout Europe to find good designs from museums and private collections. To show how the material found favour, we might mention that in 1880 the consumption was 200 rolls per month, whilst in 1890 the sales average 2,500 rolls per month. To produce this quantity of a hand-made paper, the manufacture gives employment to about 1,000 workmen, which formerly only employed a few families, so that it is to Mr. Rottmann's merit that so many workpeople are enjoying the advantages of this new industry. Several of the designs having more of Japanese character, are from his pencil, and he has devoted himself to ornamental designs in silks for seasons and drapery; these designs, whilst going away from every-day style, still have the Japanese character. In addition to being manufacturers of the leather paper, his firm import to a very large extent other materials for interior decorations—viz., vases, plaques, screens, embroideries, carvings, bronzes, &c., which are kept in stock in great variety. Mr. Rottmann's portrait is from the studio of Mr. C. A. Gaudy, of Bishopsgate-street Without, E.C.

Mr. Mark Fawcett is the head of the firm of Mark Fawcett and Co., fireproofing and constructional engineers, of 50, Queen Anne's Gate, Westminster, and is the inventor and patentee of the now well-known Fawcett's fireproof flooring. He was born at Lincoln in 1860, and educated at the Newland School. In 1875 he was apprenticed to Mr. W. D. Harrison, contractor, of Lincoln, and for four years worked at the bench. He also became an evening student at the Lincoln School of Science and Art, and during this time succeeded in passing the advanced and honours examinations in building construction, and also carried off some prizes for design and drawing. In 1879 he was articled to Messrs. Bellamy and Hardy, architects, of Lincoln, and, in consequence of his knowledge of constructional ironwork, was at once appointed to superintend various building and engineering works intrusted to them, particularly the New Corn Exchange and Markets and the Exchange Arcade. On the completion of his articles he assisted Mr. J. Thorpe for some time, working on the drawings for the main drainage of King's Lynn and the Horncastle water supply. In 1882 he came to London and entered the office of Mr. J. Douglass Mathews, F.R.I.B.A., as chief assistant, and remained with him until 1887, when he commenced practice on his own account. He first began to make experiments with a view to improving the construction of fireproof floors in 1886, but did not succeed in putting his theories into practice until the close of 1887, when he made a model of his patent Tubular Lintel, which he at once showed to his old master and friend, Mr. Mathews, who highly approved of it, and advised him to take out a patent. Mr. Mathews was the first to use his construction at Barclay and Fry's new factory in the Grove, Southwark, and has since used it for warehouses at Stoke Newington and Bethnal Green-road. Mr. Fawcett at once decided to work the patents himself, and in March last took into partnership his old friend and colleague, Mr. B. A. Elphicke (who was articled to Mr. Mathews) the style of the partnership being Mark Fawcett and Co. During the past year the demand for their construction has been rapidly increasing, the works at Reading are being largely extended, and they are also commencing to manufacture their patent Tubular Lintels at Nottingham. Recently, their fireproof floor has been chosen for the Children's Hospital, Great Ormond-street; block of offices, Billiter-street; warehouse, Smithfield; house, Burgess-hill; residential flats, St. Peter's Park; the Capital and Counties Bank, Guernsey; Swaylands house, Penshurst; the Royal Albert Hall Mansions; and other important buildings, altogether over a million superficial feet of floor area. The portrait given herewith is by Messrs. S. W. and E. Elmes, of Chelsea.

Mr. Arnold Wright Kershaw, the patentee of the pneumatic ventilator, is the son of David Kershaw, of Gomersal, in Leeds, whose ancestors were well-known builders and contractors in that neighbourhood for generations. He was born in 1853, and educated as an architect, being a pupil of Messrs. T. H. and F. Healey, of Bradford. He removed to Lancaster in 1879, being then appointed architect for the new large annexe of the Lancaster County Asylum. In 1882 he made extensive experiments with different forms of automatic ventilators, and in that year patented the pneumatic ventilator now well known to our readers. The ventilator soon became popular, and has developed a successful business now carried on at Custom House Buildings, St. George's Quay, Lancaster. We could not spare space for even a representative list of the many buildings, notably Government buildings, both at home and abroad, where these ventilators have been successfully adopted. The photograph printed to-day is by Mr. Davis, of Lancaster.

Mr. E. H. Shorland, of St. Gabriel's Works, Manchester, is the sole proprietor and manufacturer of the well-known patent Manchester grate, patent Manchester stove, and other warming and ventilating appliances. He is the son of the late Mr. G. L. Shorland (of the late firm of Shillito and Shorland), who was the original inventor and patentee of the Manchester School grate and Manchester stove. Mr. G. L. Shorland, whose name will always be associated with warming and ventilation, claimed to be the originator of vertical tube ventilation, commonly known as "Tobin's." Mr. E. H. Shorland succeeded to the business in 1880, since which time he has had the full management and control of the same. He has himself made many patented improvements in the Manchester grates, stoves and ventilators, and the business under his management has greatly extended. It would be impossible in this notice to give anything

approaching a list of the public buildings warmed and ventilated by Mr. E. H. Shorland; but the following are a few: Seamen's Barracks, Portsmouth, for H.M.'s Government; barracks, Devonport, for H.M.'s Government; Royal Naval Hospital and Royal Naval College, Greenwich, for H.M.'s Government; the Bank of England, London, and most of its branches throughout the country; Anglo-German Hospital, Rosario, for the Argentine Republic; Birmingham Workhouse Hospitals; Brentford Workhouse Hospitals and Infirmary; Manchester Workhouse Hospitals, Withington; Salford Workhouse Hospitals, Hope, near Manchester; Barnsley Workhouse Hospitals; Oldham Workhouse Hospitals; Coventry Workhouse Infirmary; Dartford Union Infirmary; Lancaster County Asylum, Prestwich, near Manchester; Argyle and Bute Asylum, Ardrishaig; Edinburgh Board Schools; Reading Board Schools; Bedford Elementary Schools, &c. Mr. E. H. Shorland was awarded a silver medal (the highest award) at the International Smoke Abatement Exhibition, London, 1882, and a prize medal at the Smoke Abatement Exhibition, Manchester; also a silver medal (highest award) at the Building Trades' Exhibition, London, 1886, by the Society of Architects. In all the improvements made to increase the efficiency of the patent Manchester grates and stoves, Mr. E. H. Shorland has always kept in view simplicity of construction and design, and to this may be attributed in a large degree the ever-growing popularity and success of the warm-air ventilating Manchester grates and stoves. The photograph reproduced was taken by Mr. Warwick Brookes, of Manchester.

Mr. John Hassall, managing partner of the firm of John Knowles and Co., Mount Pleasant Works, Wooden Box, Burton-on-Trent, is the nephew of the founder of the firm (the late Mr. John Knowles), and commenced his active connection with this business upon the death of Mr. Knowles in 1869. Mr. Knowles was a well-known railway contractor, and carried out many extensive works under the late George Stephenson and other eminent engineers, and it was during the construction of the Leicester and Burton line, half a century ago, that he came across the beds of fire and other clays from which originated the present extensive works. The staple manufactures are all kinds of fire resisting goods, and sanitary pipes and appliances used in connection with main sewerage works and house drainage. The former have a very high reputation, and are largely used by the principal steel and iron manufacturing firms in the north of England, Sheffield, the Midlands, and other parts of the United Kingdom. This firm is also engaged in the manufacture of every kind of fire-clay backs and linings for coal and gas stoves, and do a very extensive business therein. As regards their sanitary ware, this has more than a local reputation, and of late years the manufacfacture by them of drain-pipes, fitted with "Hassall's" patent safety joint, has developed to a large extent. This patent joint has earned warm eulogiums from the most eminent engineers and sanitary specialists of the day, and its capabilities have been successfully tested in the drainage of Acton, Birkenhead, Birmingham, Bexhill-on-Sea, Brighton, Bournemouth, Hastings, Hounslow, Kettering, London County Council, Leicester, Liverpool, Manchester, Newhaven, Nottingham and district, Richmond, and other parts of the Thames Valley, Sheffield, Walthamstow, and numerous others towns at home and abroad, as well as in the drainage of sundry private mansions and estates. The firm do a considerable export trade, and their fireclay wares, raw and manufactured, and also sanitary goods, are exported to the Continent, North America, South America, the West Indies, Japan, India, the Australian Colonies, and other places. They employ many hundreds of hands at their works and depots in Sheffield, Nottingham, Birmingham, and London. Mr. Hassall is also the hon. sec. of the Midland Association of Sanitary, Stoneware, and Fireclay Goods Manufacturers, and on the occasion of their first anniversary last January was presented with a handsome piece of solid silver plate in recognition of his services in connection therewith. Messrs. Elliott and Fry took the photograph given with these notes.

[Mr. W. F. Unsworth wishes us to state that in the designing of the Shakespeare Memorial, Stratford-on-Avon; the Hill, Stratford-on-Avon; and Shepherd's Spring, Hants; for which we gave him the entire credit as architect in our biographical notice last week, he was associated with Mr. Edward Dodgshun, now of Leeds, with whom he was then in partnership.]

ARCHITECTURAL ASSOCIATION: EXCURSION TO OXFORDSHIRE.

THE official programme for the forthcoming annual excursion of this Society has this week been issued to the members. It is the twenty-first of the series. The proceedings are to commence on Monday, August 11th, and the head-quarters of the party will be the Mitre Hotel at Oxford. Monday and Saturday will be devoted to the colleges, cathedral, and churches of the city; Tuesday: Iffley, Dorchester, and Ewelme will be visited; Wednesday: Stanton Harcourt, Witney, and Coggs; Thursday will be occupied by visits viâ Witney to Minster-Lovel, Asthall, and Burford; and Friday is to be occupied with Woodstock, Blenheim, Kidlington, and Water Eaton. The wisdom of confining the visits to a few good examples of work each day is shown by this list. In former years the programme has sometimes been somewhat overcrowded. Oxford itself would, of course, well furnish the whole week, but two days only could be spared out of the six, and for these a wise choice of subjects will be necessary to insure the inspection of the more important buildings, including some at least of the new work.

MORE DEFECTS IN LONDON BOARD SCHOOLS.

THE London School Board considered at their last meeting a report by the Works Committee on the defects discovered in the school in Goodrich-road, East Dulwich, one built in 1885-6 under the Board's present architect, Mr. Bailey. An expenditure of £2,400 upon it was now asked for, exclusive of the cost of rearranging the drainage, but including the cost of painting, which would in the ordinary way be about £500. A detailed report by the superior officer for repairs stated that some of the material was of fair quality, but that in some cases the quality was not that contracted for and paid for, and there was a great lack of skilled work. In the drains the joints had been covered with clay instead of being cemented, and leakage was the consequence. The joiners' work was very inferior, particularly at the framings of doors, and these had had to be filled up. In addition to the detailed defects, the officer said there were several matters which showed deviation from the terms of the specification or unskilful workmanship; the horizontal waste-pipes under the girls' and infants' ranges of lavatories were laid with a fall the wrong way; these had had to be taken up and refixed. The asphalte floors of the offices were laid with falls away from, instead of to, the gullies. As pools of water stood on these floors, it had been necessary to take them up and relay them. The zinc weathering on strings and cornices was not in many places sufficiently wide to be tucked into the brickwork and pointed as specified. Water consequently got under the flashings and injured the brickwork. The ironwork, such as bolts, straps, &c., specified for the roof timbers, had not all been provided. The brickwork in the spaces in the roof had not been made good around the roof-timbers, air-flues, and other places. The painting, repairs, &c., now in hand promised to cost from £1,500 to £2,000, exclusive of work to the drains. It did not appear necessary to interfere with the latter this year.

The architect, being called upon to reply, suggested that the clerk of the works should be called upon to account for the deviations from the specification. He pointed out the manner in which the tenders were invited for this school. "There were about a hundred builders on the Board's list, to each of whom a reply postcard was sent asking them if they would be willing to tender, so that they thus had the privilege of inviting themselves. This resulted in 22 tenders being received for this school, the highest being £19,812, and the lowest £17,170. He submitted an estimate before the tenders were opened, the amount being £18,115, or about £1,000 more than the lowest tender, and the fact that most of the builders on the Board's present selected list who tendered sent in prices above his estimate would show that this was quite low enough for the work. The builder stated that he lost heavily over the contract, and he became bankrupt in the following year." In conclusion, Mr. Bailey added that, in his opinion, this school was, with regard to plan and general arrangements, the best and most complete school for 1,600 children that the Board possessed, and he, as architect, felt most keenly that the scheme should have been marred by bad workmanship, and the case put forward for universal opprobrium.

Correspondence was put in to show that constant complaints had been made to the builders during the progress of the work, and bad work had been remedied. The action taken by the committee to remedy the defects at a cost of £2,400, inclusive of painting but exclusive of the drainage work necessary, was confirmed.

Mr. Raphael moved a resolution referring to these defects in the schools. The resolution took the form of an inquiry as to the architect's competency. The inquiry would elicit whether the Board expected too much from the architect, and imposed so many duties on him that it was impossible for him to visit the schools which were being built. Mr. Laing seconded the motion.

The Rev. H. Curtis moved, as an amendment, that there should be a reference to a special committee to report upon the defects at the Goodrich-road School, and at other schools, and to advise the Board upon the steps to be taken to prevent a recurrence of such a state of things in the future.

Mr. Whiteley seconded this amendment, which was accepted by Mr. Raphael, and adopted.

The Board received yesterday (Thursday) a report from the works committee with reference to Essex-street school, Tower Hamlets, opened in August, 1886, stating that the clerk of works, the measuring surveyor, and the superior officer for repairs had found various defects in the ceilings, drains, and tar-paving. The committee recommended that an action be entered against the contractor (whose name was given) to recover damages for breaches of contract.

CHIPS.

At a sale of oak timber on the Wentworth Woodhouse estate, belonging to Earl Fitzwilliam, very high prices were obtained, one tree fetching £110, said to be the largest sum yet given at an auction for any English-grown tree.

A public drinking fountain was presented last week to West Bay, Bridport, by a lady. It is of Aberdeen granite and Portland stone, and was executed by Mr. Milverton, of Bridport.

The Sunday school attached to the David Thomas Memorial Church at Bristol, which has been enlarged and reconstructed at a cost of £1,250, was reopened on the 10th inst. The assembly hall is 60ft. by 26ft., and is 28ft. in height. It has a gallery off which and on the ground floor are classrooms on either side, and the total accommodation is for 600 children and 100 infants. The style is Early English, harmonising with the church. Mr. Alfred Harford, Broad-street, Bristol, is the architect, and Messrs. Robert Wilkins and Sons, Surrey-street, in the same city, are the contractors.

A public hall at Newtown, St. Boswell's, N.B., erected as a memorial to the late Hon. Robert Baillie, was formally opened on Saturday. It has been built from plans by Messrs. Hardy and Wight, of Edinburgh, and includes a room for lectures and a reading room.

A marble bust of Richard Jeffries, "the prose poet of the Wiltshire Downs," is to be placed in Salisbury Cathedral. It will be executed by Miss Margaret Thomas.

The School Board for Leamington adopted at their last meeting plans submitted in competition by Messrs. Nicholls and Son for new schools for 300 boys in Shrubland-street, subject to revision and amendment by Mr. Foster, their architect, the arrangement for commission being that if the work is eventually intrusted to Mr. Foster he is to receive 5 per cent., but to repay out of this 20 guineas towards the £50 paid by the board as a premium to Messrs. Nicholls and Son.

On Thursday afternoon in last week the memorial stones for a new Welsh Calvinistic Methodist chapel were laid at Briton Ferry. The site is in Ynismardy-road, and the chapel will accommodate about five hundred persons. The architect for the building is Mr. W. Jones, Ystrad, Rhondda Valley, and the contractor Mr. Lloyd, Cymmer.

Messrs. Pitman and Son, of Newgate-street, E.C., are now completing the painting and decorative works which have for many weeks past been in progress at the unique City church of St. Peter-le-Poer, Old Broad-street. Their work also includes two large ornamental leaded glass windows. The architects are Messrs. A. and E. Billing, of Tooley-street, S.E.

ILLUSTRATIONS.

SIX CONTEMPORARY BRITISH MANUFACTURERS AND ART WORKERS.—DESIGNS FOR THE SHEFFIELD MUNICIPAL BUILDINGS.—TREFUSIS, FALMOUTH.—MERIOOLA, MAIDENHEAD.

Our Illustrations.

CONTEMPORARY BRITISH MANUFACTURERS AND ART-WORKERS.

(SEE description on p. 106.)

SHEFFIELD MUNICIPAL BUILDINGS—THE FINAL COMPETITION DESIGNS.

WE complete to-day our series of illustrations of the six final designs, prepared by the selected competitors, by giving drawings of Messrs. Harvey and Smith's design, Mr. James Lindsay's design, and that by Messrs. Flockton and Gibbs. We have already illustrated the chosen design by Mr. Mountford, and those by Mr. Tulloch and Mr. Hare, the two other competitors. Our readers can now, for the first time, compare the several designs properly, as they have been reproduced in our pages with the same uniform clearness, thus bringing out into due prominence the relative merits of each of the compositions. Messrs. William Harvey and Bernard Smith's design is thus described in their report:—The drawings show several important modifications of the original plan. The large principal offices are arranged on the ground floor level as before, but the entrance from Norfolk-street has been abandoned, and a large entrance and staircase hall placed at the corner of Surrey and Norfolk-streets. The borough accountant's office has been so arranged that all the rooms of the staff now open direct into the general office. The rates office is approached from Pinstone-street, Surrey-street, and Cheney-row, and, as now planned, the Pinstone-street entrance can be closed if required on special occasions, without in any way interfering with the general work of the office. The arrangement of the water department has been considerably varied, by the accompanying plan the offices of the staff are all grouped around the general office, a private corridor communicates and avoids the necessity of the staff entering the general office in order to reach each other's offices; a staircase at the end of the corridor next Surrey-street leads direct to the engineer's office and drawing-office on the floor above. An alteration has been made in the borough surveyor's department by which the district surveyor's office is brought close to the surveyor's office. In the health department the general office has been placed at the corner of Pinstone-street and Cheney-row, the medical offices and cleansing inspector's offices being placed on each side of the Cheney-row entrance. On the first floor the principal alterations consist of the arrangement for a second mayor's parlour for business use, the provision of a lobby leading directly from the council chamber ante-room to the committee-rooms and a rearrangement of the town clerk's department which it is considered would prove more convenient. An approximate estimate of the cost of the proposed building is £79,934 17s. 7d.

Mr. James Lindsay thus refers to his design:—"Simplicity has been aimed at in the block-plan, as well as in the lines of the corridors, and none of the business rooms obtain light from the two inclosed areas, with exception of the water office, which is top-lighted. The principal or mayor's entrance is from Pinstone-street, and the general business entrance is from Surrey-street; additional entrances are provided from Norfolk-street, as well as Cheney-row, and the basement floor next Cheney-row can be entered on the level from the large open court. The water and accountant's departments are placed on the lower ground floor, to the right and left of the Surrey-street entrance, the general office in each case having ample public and counter space, and serves as inquiry to the various rooms of the officials, which are grouped in view and in front of the counters. The accountant's department is all on one floor, but the water department is continued on the upper ground floor. By placing the two principal departments on the lower ground floor, and close to the entrance, would relieve the corridors and staircases of a considerable amount of traffic which at times will happen in connection with these departments. The council-chamber, together with its suite of six committee-rooms, are so situated that they would all be absolutely free, not only from external disturbing elements, but also from the general business traffic within the building. Access to the council-chamber can only be had through its ante-room, and also a doorway from the committee corridor. The sub-committee rooms are centrally placed, and within easy reach of the various departments. The unusual treatment of the principal stairs has been adopted, so that the council-chamber should be brought into closer connection with the mayor's suite, and the passage connecting the north and south landings, with a balustrade, and 10ft. of open space on one side, is certainly preferable to the usual 10ft. or 11ft. corridor. The cubic contents measuring from the datum line 262·0 are 1,843,600c.ft."

Messrs. Flockton and Gibbs, in their report, from which we quote, give the following explanatory statement referring to their design: The building is placed within the boundaries of the site, having its principal front and main entrance facing directly the large open space, about 225ft. long and 202ft. wide, formed by the junction of the five streets, the obelisk in the middle of which is in the central line of the building. The main entrance is thus fixed in the most prominent and convenient position for access from all five streets. The other three fronts have also open spaces between them and Pinstone-street, St. Paul's Churchyard, and Surrey-street, and thus an abundant supply of light and air is secured on all sides, while the building is exceptionally well placed for being seen to advantage from all surrounding points. The one-story building in Surrey-street is so comparatively low as not to interfere with these advantages, but rather to enhance the effect of the main building by spreading its base, and giving attachment to the ground. The fine open space or "place" resulting from the street improvements in this locality is by this design turned to the greatest advantage both to the building and itself. A considerable plot of land at the Norfolk-street end, sufficient to provide accommodation for three or four additional departments, remains unappropriated. Each set of offices for a department is made complete in itself, the entrance for the public being into and by way of the general or inquiry office, from which access is easy and direct to a corridor, in which are the private offices. These corridors give the officers the means of communicating with each other without entering the general office, and also with the general office at different points. The advantages of this plan over the usual arrangement of public corridors consist, not merely in the feature that no facilities are given for the public to seek admittance where they are not wanted; but that the private offices are rendered more quiet and undisturbed, the intercommunication more easy, and the control by the heads of the department more perfect. The departments, except the health department, are all approached from the central hall with its staircases, which is entered from the outside by the principal doorway. Private entrances and staircases and other means of communication are provided for the officials. The entrances to the accountant's and water departments are on opposite sides of the central hall, and from the hall can be seen those to the department of the town clerk and the borough surveyor, so that one hall porter centrally placed could control the whole. The health department has a separate entrance from Surrey-street. The council-chamber, reception, and committee rooms occupy an entire floor. The pay office, smiths' shop, meter-testing, weights and measures, and room for sale of disinfectants, also the public waiting-rooms, lavatories, &c., it has been thought very desirable to keep outside the main structure, and they are therefore provided in detached buildings. The borough accountant's general office has a counter 78ft. long, and in addition to accommodation as shown on the plan for 30 clerks at desks, there is room for an extension of desks so as, if required, to raise this number to 44. This and the water-works general office are lighted partly from skylights and partly from windows 5ft. 6in. high on each side of the raised central portions; these windows being also available for ventilation. The council chamber is in the form best adapted for speaking and hearing, nearer a square than a semicircle in proportion, has abundant light, and is in a position free from noise. It will seat more than the present number of members of the Council.

	Net cubical contents.
Foundations from 10ft. below present surface up to area level ...	122,143
Tower from 12ft. below present surface up to area level ...	1211,621
Superstructure from area level to eaves spouts	
Roofs ...	132,075

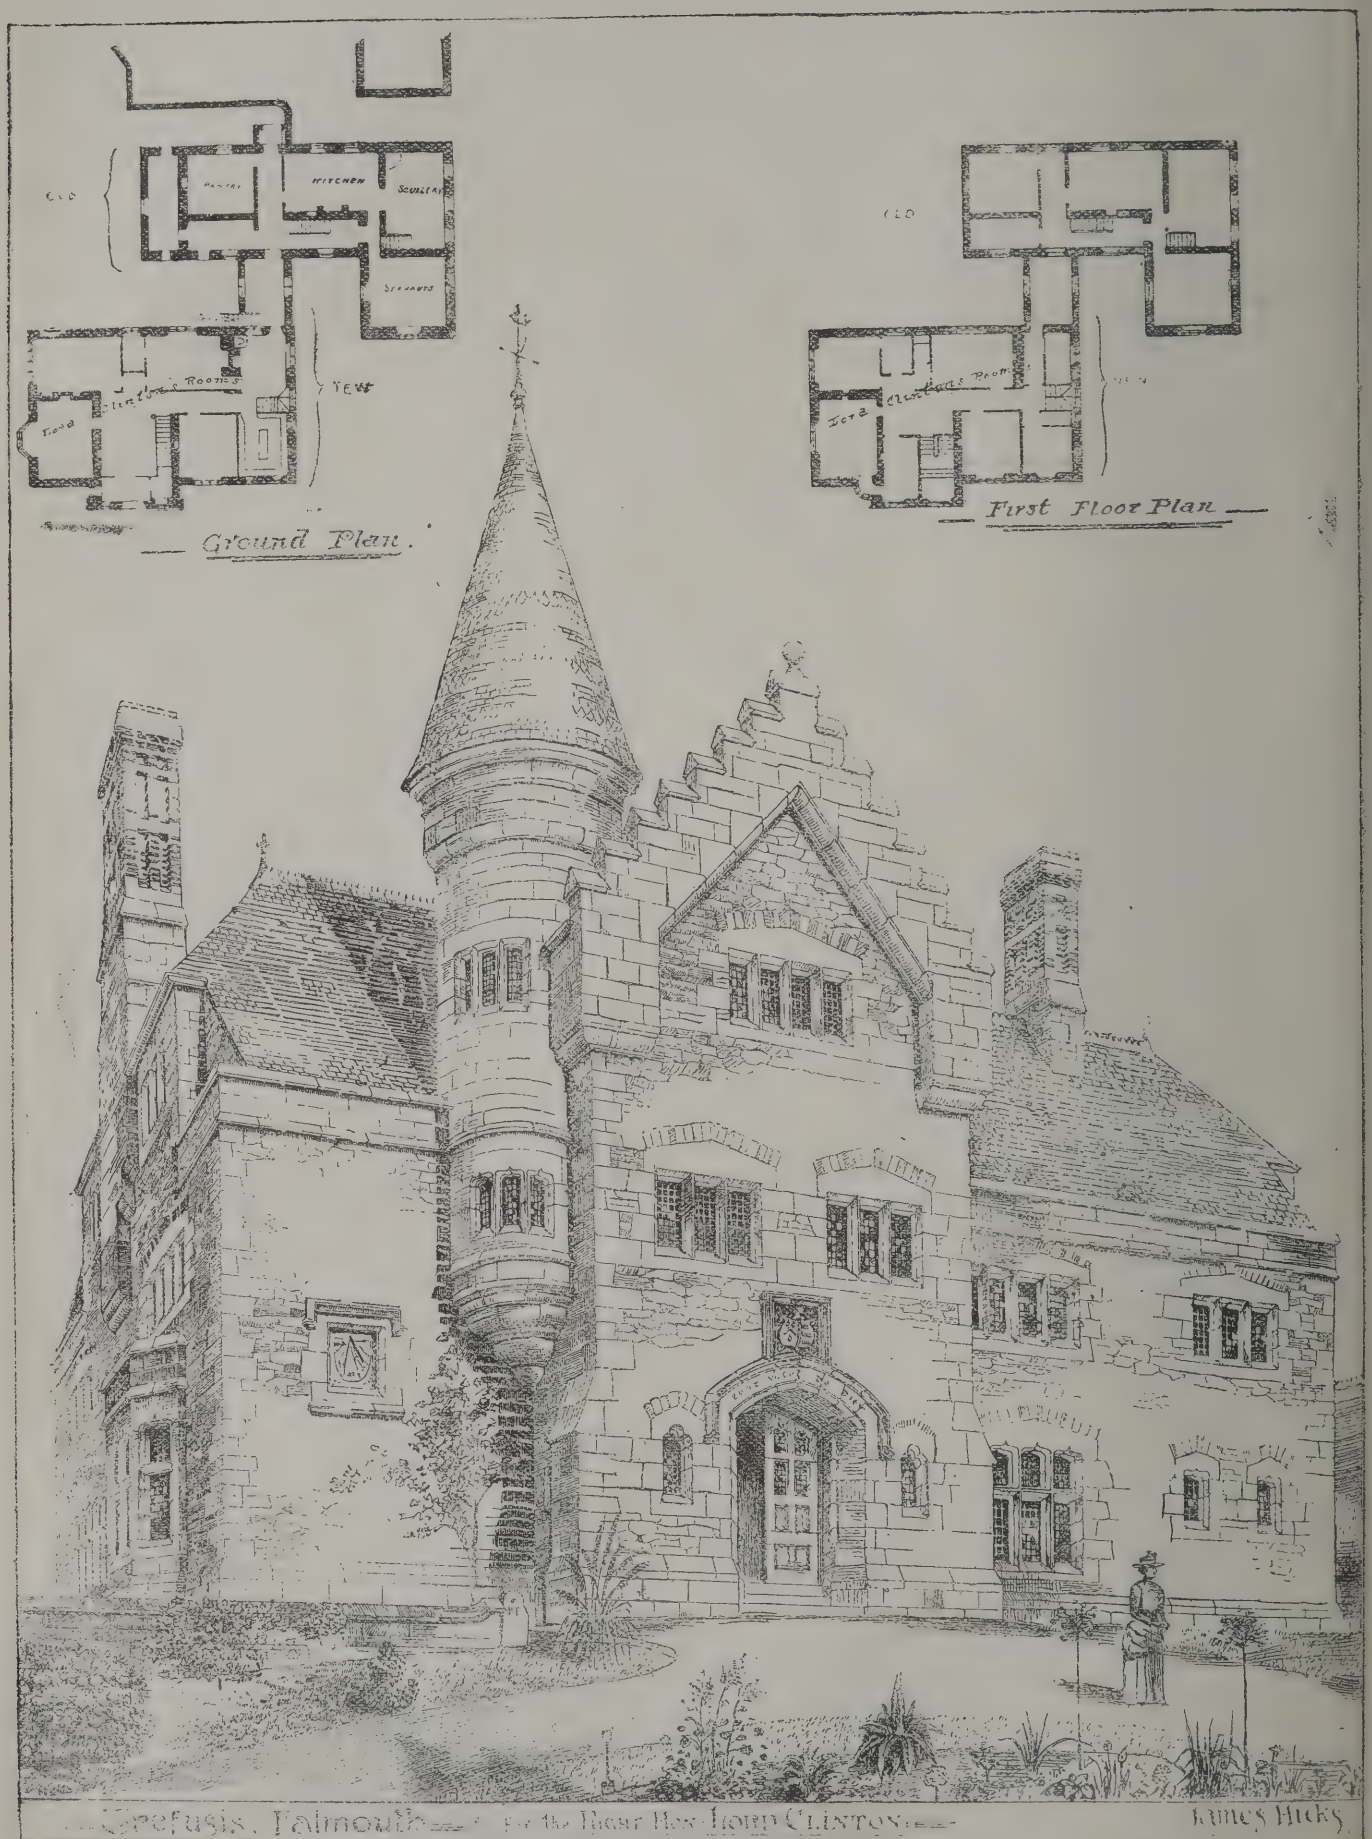
Area walls, balustrades, steps, &c. ...	8,651
Total ...	15,540,539

These works can be carried out for £80,000.

TREFUSIS.

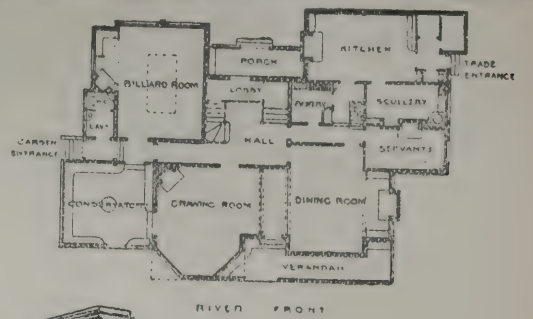
THIS house, now in course of erection, is situate on the slope of the hill overlooking Falmouth Harbour. The view from this hill is said to be one of the finest in Europe, embracing as it does river, harbour, ocean, woodland, rich pasture land, distant hills, and the quaint old town of Falmouth. An Early Tudor mansion-house formerly stood where the new building is rising. That was very much altered and enlarged in the Early Georgian style, and that in turn, not having been occupied for many years, fell into a state of dilapidation and decay, necessitating rebuilding. Lord Clinton's principal residences are in Devonshire and Scotland, and this at Trefusis is only intended as subsidiary. It is not, therefore, of large dimensions, and is for only occasional use, and for the most part will be in charge of the manager of the home farm. The walls are erected of granite in natural random work, and all the dressings are of granite from the celebrated Penryn quarries, and the roofs are of grey slate. Some quaint fireplaces in granite in the Tudor mansion have been refixed, and the principal rooms will be lined with oak panelling taken from the Georgian mansion, the design of the new building being affected by that consideration. The builder is Mr. Kelway, of Falmouth, and the architect Mr. James Hicks, M.S.A., Redruth.



"MERIOOLA," MAIDENHEAD COURT ESTATE, BERKS.

THIS residence has just been completed on the above estate, situate just above Boulter's Lock, and overlooking Clieveden Woods. The exterior is in red brick and half-timber work, all of which is in oak; the internal work is of an expensive character, the entire staircase being in wainscot. The drawing-room has been treated in the Arabesque style. The total cost, inclusive of lodge, stabling, &c., was £7,000. The works were carried out by Mr. G. H. Gibson, of High Wycombe, Bucks, from the designs of Mr. Frederick Wheeler, F.R.I.B.A., 22, Chancery-lane, W.C., and 50, Carfax, Horsham, Sussex.

A memorial cross, 10ft. 6in. in height, from designs by Mr. Mileham, of Chislehurst, has been placed on the spot in the Mamore forest, in Scotland, where the Rev. A. H. Mackonochie was found dead in December, 1887.



Mr. S. J. Smith, inspector under the Local Government Board, held an inquiry on Wednesday week at Bournemouth with respect to the application by the Improvement Commissioners for sanction to borrow £8,400 for works for the flushing and ventilation of sewers and the watering of roads, £3,300 for works of outfall sewerage at Alum Chine, £1,500 for alterations to West Yard, £800 for providing hydrants, £320 for works of private street improvement, and £200 for addition to a hospital.

WAYSIDE NOTES.

THE Earl of Rosebery has resigned his position as Chairman to the London County Council amid the splendour of many "opening" ceremonials. That much-needed structure, the new Battersea Bridge, was formally opened for traffic on Monday afternoon, and on the same day the new street running from the Holborn Town Hall to the Farrington-road was duly inaugurated. No less a boon is this latter improvement, although the full benefit of its construction may not be apparent until the remainder of the proposed thoroughfare leading to the "Angel" at Islington be constructed. In thus closing his arduous duties as chairman to the Council, the noble Earl brings to a conclusion a term of service to the citizens of London that should leave behind a feeling of indebtedness. What mistakes the Council would have made had not their chairman held the guiding reins with such a firm hand, it would be difficult to say; but those who have habitually perused the reports of the Council's meetings know how admirably the offices of the chair have been fulfilled. To have so managed affairs that the public remain pleased with the success, and at the same time to have preserved equanimity among the councillors themselves is to have accomplished no small feat, seeing that the body of which the Earl of Rosebery took command is even now but young and inexperienced.

Sir John Lubbock, who was elected chairman on Tuesday by a majority of 33, takes up the reins after the "breaking in," so to speak, and, consequently, should be in a position to better and more easily restrain any *breaking out*, such as that which occurred at the Council's last meeting on the occasion of a discussion as to London improvements. It seems a pity that so wonderfully little business was got through at this meeting, and that such prosaic matters as street improvements and the like cannot be discussed without heat and excitement. So far as I know, all the proposals embodied in the reports of the Improvements Committee may be classed as "necessary." The Isle of Dogs is to me almost as mysterious and unexplored as any of the Sandwich Isles group, so cannot say much as to the necessity for widening its four bridges, which, as at present existing, a councillor declared to be "a disgrace to the community." But the remaining districts to be improved lie within the bounds of civilisation, and we can appreciate the improvements to be made. The Chelsea Embankment scheme I described last week, and will, doubtless, be generally admitted to be "necessary" enough even to please Mr. Councillor Carr-Gomm. We know, too, that an improving hand could readily busy itself in Kentish Town and in Deptford, and Vauxhall and Hammersmith are not in every thoroughfare so perfect as to make improvement superfluous. Kensington High-street may be vastly bettered, as I have often pointed out, and it should receive early attention. Now, what there is in the consideration of these matters to rouse the County Council to vestry-like behaviour, will pass the comprehension of many. The Isle of Dogs Improvement Scheme was not agreed to without quite a scene, and then only on condition of the Limehouse District Board's contributing certain funds to the cost of the widening of the bridges—a condition that may be, and doubtless is, only just and fair; but one that could surely have been arranged in a quiet and business like manner. Disorder almost as pronounced seems to have characterised the discussion on the Kentish Town improvements. It was finally agreed to take steps to widen Fortess-road, in that neighbourhood, but not until after much dissension. The spirit of order and despatch in the discussions of public corporations would seem to have gone by with the good old times. Its opposites are ever ready to break out in any assembly of to-day, and they are only to be restrained with a firm hand. Lord Rosebery effectually did so during his term of chairmanship to the London County Council, and for the sake of public business it is to be hoped that the new chairman will be equally firm and resolute.

Sorry I was not "up" in the price of coals; but perhaps readers will not think that it should be part of my duty to follow the minute variations in the coal-market. Perhaps I can please "Hiram" better on the jerry-building question. He has reason in believing that restrictions as to the time of surveying a builder's operations will, in general, encourage bad construction. In the case of ordinary contracts, where one is doubtful of the contractor, there is nothing like dropping on him at all hours of the day when least expected. I was unaware of the new regulations as to district surveyors, which do not seem likely to promote sounder construction than in days past. At the same time, the evil will be most marked in connection with buildings erected without architects, and will not be so pronounced where these latter are employed. Between eleven and four o'clock should allow of sufficient time for the surveyors to see that the main provisions of the Building Acts are fulfilled: the details of building construction may be safely left to the architects engaged. Where there is no architect the district surveyor has more to do—and he should have—and it would be an advantage for him to be enabled to look in here and there at any odd time. I daresay that many of the district surveyors will be sorry that they are confined to the hours mentioned by your correspondent, wherein they may inspect the works within their jurisdiction; for it may often happen that it would be very convenient for them to get through certain official inspections earlier or later. The exact purpose and the wisdom of the alteration is therefore not at once apparent. It is certainly hampering the surveyor's power for good, and facilitating those occasions when the builder is enabled to hide away a wonderful amount of doubtful work in a very short time. If, therefore, "Hiram" be a district surveyor, he has my sympathy, which I trust may in some measure compensate for my lack of knowledge of the price of coals.

I have just been getting my hand in for the holiday season by a preliminary run down to North Wales, and, although mid-day Friday at Euston to nearly midnight Tuesday at the same place doesn't allow of a vast deal of sight-seeing, I managed to get in a small stock of mountain air and note a fact or two with respect to old architecture. Among other things I made a careful inspection of old Conway Castle, a building many pass by in the Irish expresses, but comparatively few stay to inspect, unless, as in my own case, they find themselves in the neighbourhood with a few hours to spare. I do not know of any old ruined castle that has given me more enjoyment in its inspection than this massive Welsh stronghold. One is doubtless much influenced by its beautiful position overlooking the waters of the Conway, and at the foot of the long slope that sweeps up to the heathery summit of one of the most imposing of the Welsh mountains, which also proves a grand background to the old ruin when the spectator stands on the other side of the river. Nearer at hand the aspect of the north side of the castle is a striking example of the power of simplicity in composition and of breadth of effect. The four great round towers, projecting so boldly from the main castle wall, when seen in sharp perspective, have a broadness of ultimate effect of which I have not seen the equal. Internally, there has evidently been beautiful work in windows, doors, and fireplaces, and the so-called Queen's Chapel is a gem. This feature is curiously unlike English or Welsh work, and reminds me more than anything of some of the architectural designs executed in granite that I have met with in Brittany. May-be that when the details were intact this effect would not have been produced; but as it now stands, in glorious decay, it is very apparent. The name "Queen's Chapel" I take to be somwhat of a misnomer. It is a lovely little recess in the tower called the "Queen's Tower," and very like a tiny apsidal chapel; but it may have been simply an ornamental recess or bay. Anyhow, whatsoever its uses may have been, it is a gem of design, and classes A1 among my memories.

In that quaint old home in the town of Conway—the *Plas Mawr*—the Royal Cambrian Academy is holding an exhibition of pictures, many of which are fine, and to the Englishman of additional interest as affording an opportunity of seeing a large number of Welsh scenes in one and the same collection. It was understood that the Academy was to have erected a new gallery in connection with the Plas Mawr which it has made its home; but no signs of building appear so far, the garden, suggested as a site for the gallery, being truly a "howling wilderness" full of slate blocks and general *débris*. It would not be a bad idea for the Academy to erect the gallery, as to persons anything over quite ordinary stature the strangely low doorways in the old Plas Mawr are rather too numerous. Of the exhibition I saw something, but the chief attraction was naturally the old house itself with its fine stone chimney-pieces, quaint plaster moulding, oak panelling, and the splendid black oak furniture—tables, chairs, chests, &c., that must be enchanting to those architects who may perhaps be called *furniture specialists*.

Conway Church, too, I saw, and wondered at the eccentricity of its builders in placing the nave arcade upon columns about half-a-foot wider than the walling above the arches. Like most digressions of this nature, the effect is more curious than beautiful, but ample compensation for this awkward piece of design—if design had anything to do with the matter: I rather think it was caused by a haphazard method of going to work—is to be found in other interesting features of Conway Church. Besides Conway I saw much whilst in the Principality. Llandudno and Penmaenmawr are as flourishing as they deserve to be, beautiful watering-places as they are, and, from all I could see, building is as lively thereabouts as anywhere, and the jerry-builder rampageth not the land. I did not get to the curious old church in the parish of Llanfairpwllgwyngyllgoqerychwyrndrobwlltysiliogogogoch; but I made my way over the Great Orme's Head to the tiny little church of St. Tudno, that looks out from its breezy height over the waters of St. George's Channel, and which, being too small for fine weather congregations, possesses an open-air combined pulpit and reading desk in the little churchyard. And as I, moreover, rambled among the streets and "rows" of Chester, and about the nave and aisle, and choir of the beautiful cathedral of that town on my homeward journey, I think I may say I did pretty well in the way of a Friday to Tuesday's outing. GOTH.

NOTES ON BUILDING PRICES.—IV.

By JOHN LEANING.

PRELIMINARY AND MISCELLANEOUS ITEMS.

THESE, whether they appear in a Bill of Quantities or Specifications or not, must always be allowed for in making an estimate, and they are better kept separate than included in the allowance on the items for profit.

Scaffolding.—The use of scaffolding and sheds may be looked upon as establishment charges, but they are most conveniently and exactly dealt with in their connection with a particular building. As they are means to the end of obtaining a profit, they had better be treated as a net outlay, and no profit added. Some builders calculate cost of scaffolding at so much for each rod of brickwork. Probably under ordinary circumstances it costs 4s. per rod. An exact calculation may be made by taking out the quantities of it, a row of scaffold poles at the usual distance completely encircling the building ledgers at about 5ft. apart, and the necessary putlogs, boards, ladders, and cords, calculate the cost, and add on this cost, say, 7½ per cent. per annum for interest on capital and depreciation, add labour, fixing, and the number of loads carted. When the work is in the country, the number of loads requiring carting and railway carriage must be allowed for. For large halls or churches, interior as well as exterior scaffolding will be required, and the use of this should be separately calculated. The cost of scaffolding will vary according to circumstances. Sometimes the builder may obtain work in the neighbourhood of another building from which the scaffolding has not yet been removed—he can consequently transfer it at a small expense; at other times the cost of carriage is so great that it will better serve his purpose to buy new in the vicinity of the proposed building. It is the frequent practice of the contractor for railways, docks, canals, or other great works of engineering to buy new plant for a particular work, selling it at the close for what it will fetch. When works are delayed for a long period, as sometimes happens, hire of scaffolding will probably be claimed, and properly so. The decay of scaffolding is rapid; a year's delay in the progress of a building leaves the cords useless for another work, and many of the poles badly decayed at

their butts. The boards and putlogs would probably have suffered but little. If a definite charge for scaffolding appears in the deposited bill of quantities, the stipulated time for the completion of the building may be compared with the time of delay, and a rate per week, month, or year calculated in proportion, or the scaffolding may be valued at the subjoined rates, and the value of its hire calculated as a percentage of its first cost. 7½ per cent. per annum would be enough—*i.e.*, 5 per cent. interest on capital, and 2½ per cent. for depreciation; or the charge may be estimated from the subjoined list of net charges in London for hire of building plant, which would much exceed a calculation on the lines first suggested, and are rarely allowed by experienced assessors:—

CONDITIONS OF HIRING.

1st. The scaffolding, fall ropes, &c., are sent out under careful supervision; but hirers should themselves, or by their agents, see that the goods hired are sound and sufficient for the purposes to which they may be applied, as ———— will not be responsible for any damage or loss that may occur through their unfitness or insufficiency.

2nd. A deposit is required to be left in all cases, as security on goods hired, until the articles are returned. An extra charge if less than a dozen is hired, and no charge less than a day made.

3rd. All goods to be taken from and returned to the rack or shed at the hirer's expense and risk. The day of hiring and the day of return are charged as whole days, irrespective of the hour at which the goods are hired or returned. All deficiency or damage to goods on hire will be charged for, together with the hire of, up to and including the day such deficiency has been ascertained. When any or all goods are returned, the deposit note must be brought with them, without which no deposit will be returned.

NET PRICES OF SCAFFOLDING AT DOCKS OR TIMBER MERCHANT'S.

To these prices must be added the cost of carting (see cartage), whipping the ends of the cords, worth ¾d. each, and shoeing the ends of the scaffold-boards with hoop-iron—cost about 2d. each board. Merchants charge 3s. per cwt. for cutting into lengths and whipping scaffold cords.

Painting three coats plain colour, 1½d. per round extra; iron bolts, 8d. each extra.

EXCAVATOR'S BARROWS.

Stout ash frame, 1in. elm top, full size, with leg and side stays, 14s.; ditto, extra large, with cleats to sides and two bolts through frame, and long iron stays bolted to bottom of legs, 15s. The cost of machinery, as mortar-mills, portable engines, travelling cranes, &c., may be readily obtained from the published lists of the manufacturers. The trade discounts are various—generally about 10 per cent. The depreciation of machinery per annum on first cost, according to Molesworth, is as follows:—

Engines	6 per cent.
Boilers	10 ,, ,,
Machines	7½ ,, ,,

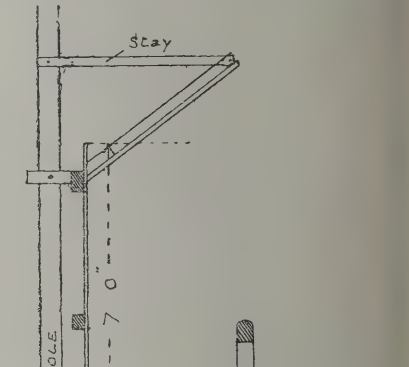
And this is pretty nearly in accord with other authorities.

The foregoing deals with scaffolding of the ordinary character. In large buildings, it will be necessary to use scaffolding of squared timber connected by iron dogs and bolts. In such a case it must be designed, and the quantities taken out charging it as use and waste. Twenty feet or thereabouts to a façade will be enough to base the whole calculation upon. Illustrations of scaffolds of this kind are to be found in Spon's "Dictionary of Engineering" and Seddon's "Builder's Work." See also the article "Scaffold" in the "Dictionary of the Architectural Society," and Cresy's "Encyclopædia of Civil Engineering"; and many interesting examples may be found in the *Transactions* of the Institution of Civil Engineers.

HIRE OF TARPAULINS.

18ft. by 12ft... 1s. 3d. per week, or any less period.
24ft. by 18ft... 2 6 ,, ,,

For any period over 28 days:—
18ft. by 12ft... 1s. 0d. per week.
24ft. by 18ft... 2 0 ,,



Some schedules regulate the hire of tarpaulins as follows:—

TARPAULINS FROM 60 TO 900FT. EACH PER 10 YARDS, SUPERFICIAL OR UNDER.

First Week.		Second Week.		Third Week.		After Third Week.	
Day	week.	day	week.	day.	week.	day.	week.
s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
0 1½	0 6	0 1	0 4	0 0½	0 2	0 0½	0 1

These would generally be used in the construction of temporary roofs, which would involve some arrangement of supports for the tarpaulins. The estimator must make a calculation of the material, pricing it as use and waste, and adding thereto the cost of fixing and removal. The same principle must be adopted for temporary floors. These contingent arrangements are so various that the only course open is clearly to realise the requirements, design something suitable, and price it.

Hoarding.—When the work involves the pulling down of an old building, enough timber and boarding can generally be obtained for use as a hoarding, or the builder has possibly more old material at his yard than he well knows what to do with, and this is available for such purposes.

Section of Hoarding
footway & fan
Scale 4 feet to an inch

The outlay is then for cartage, fixing, and removal only. When there is no old material new must be used, and the only exact way is to realise what will be necessary, and measure and value it. We will assume a case as follows, one of the simplest kind:—

Hoarding, 7ft. high, 25ft. long, with two 3ft. returns—31ft. lineal in all.
Planked footway, 3ft. wide, with post and rail.
Fan the whole length of frontage.

The sketch is a mere assumption; the variety of hoarding is considerable, but the student or

estimator will in every case be obliged to assume omething. The prices will vary according to xtent of carting, and kind of material used.

Some builders add no profit to cost of hoarding, and the dealing with the material as use and waste disposes of that consideration. When there is no stipulation in the contract against advertising, the hoarding may be let to an advertising contractor. The price per foot superficial varies with the locality, ranging between 1d. and 7d. On some of the larger building estates it is especially prohibited by the freeholder, and often the building owner prevents it by the terms of the contract. Since the passing of the Advertising Stations Rating Act, 1889, many of the vestries and district boards have prohibited advertising on hoardings; others charge a fee of so much per superficial foot of hoarding. Sometimes the advertisement contractor will include in his offer for the advertising privileges the erection and removal of hoarding. It is, however, in many respects, preferable that the builder do it himself. In cases of one builder doing the work of the basement, and another the superstructure, the first builder would erect the hoarding and leave it for the second, in which case the use and waste principle would not apply, and the whole value would be charged.

Some estimators price habitually at 6d. per foot run.

Shoring, Gantries, &c.—A visit to the building site will be necessary for the valuation of this item. Stock or Blagrove on "Shoring" will show the student what methods of shoring are best. If the site is cleared, and with old buildings on one or both sides, the shoring will probably be already done, and the question must be determined (if not provided by the specification) as to who is to pay for it, and to whom the timber shall belong when removed. When an old building is to be pulled down, sufficient old timber for the purpose is often available, when labour of fixing and removal, and cost of spikes, wedges, and hoop-iron are all that need be considered. If a credit amount has been allowed for the old building, something must be added for use and waste of the old timber. When new timber is involved, its cost must be calculated as use and waste, adding thereto the cost of labour, wedges, spikes, and hoop-iron as before. A common contract price in London for use and waste of shoring, including labour, wedges, spikes, hoop-iron, removal, and profit is 1s. 3d. per foot cube. When, from lack of room to store materials, or from necessity to keep the whole footway open, a gantry is required, it must be designed, the quantity of materials and labour calculated and priced, as recommended for shoring. In the country it will often be necessary to inclose the site of the building and a space around it with a post-and-rail fence, to prevent the men from trespassing on the adjacent land. This must be calculated in a similar way; but this will not be estimated for in the absence of an express stipulation. If, however, there is a condition in the contract to preserve the adjoining property or grounds from danger, contractors should take some precautions of the kind.

(*To be continued.*)

THE ROYAL SCOTTISH ACADEMY'S NEW CHARTER.

THE Royal Scottish Academy has issued another reply to the answers of the architects who have petitioned the Privy Council to be heard in reference to the granting of a new supplementary charter to the Royal Scottish Academy. The Academy denies that it had made unfounded and improper efforts to discredit the architects' petition. The Academy admits that among the petitioners are gentlemen eminent in their profession as architects quite entitled to the name of artists, but repeats its statement that the names of many of the signatories to the petition are unknown as artists. As to the "spontaneity" of the architects' petition, the petitioners say that, as respects Edinburgh signatures, these were mostly solicited by some three or four of the more prominent objectors, and that many signatures were got from gentlemen who did not even read the petition. It is pointed out that the architects refused to confer with the Academy on the subject of their views. In reference to the charge made against it that it had done little for art, the Academy recapitulates what it has been able to do in that respect with the limited funds at its disposal, and pleads that under the new charter the Academy hopes to do more for art, especially in the way of providing for more systematic teaching. With regard to the complaints that the claims of architecture were ignored by the Academy as respected its annual exhibition, the Academy points to the testimony of the architectural profession given in connection with the inquiry concerning the London Royal Academy. The Academy reiterates the statement previously made that it was the architects themselves that had ignored the Academy by their failure to comply with the prerequisites which the existing charter prescribes on the part of candidates for admission—viz., the exhibition of works in the Academy's exhibitions, and the placing of their names on the roll as candidates for election. It specifies several gentlemen whose names were on the architects' petition that were in this category. Mr. M'Lachlan applied for admission in 1883, but was not a qualified candidate, inasmuch as he had not, up to that time, contributed to the exhibition, and that gentleman had not renewed his application. Mr. Honeyman, Glasgow, had exhibited, but had never applied for membership. It had been said that eminent architects—such as Mr. Thomas Hamilton and Mr. W. H. Playfair—were at one time members of the Academy, but that such men did not now care for or seek its diploma. "This implies that in the opinion of the petitioning architects or of the committees who represent them, those gentlemen of their number who have applied—viz., Messrs. MacGibbon, Anderson, Blanc, and M'Lachlan—are not in the same class of architects as Mr. Hamilton and Mr. Playfair. Of this the Academy expresses no opinion. Free right to confer membership on architects as well as painters or sculptors is one of the important amendments sought in the amended charter, and yet a section of architects think fit to oppose the Academy's obtaining its new charter."

THE AUCTIONEERS' INSTITUTE.

A SPECIAL council meeting was held at the offices of the institute in London on Friday last, and was attended by representatives from Bangor, Bradford, Cambridge, Chesterfield, Cowes, Farnborough, Gravesend, Keighley, Liverpool, London, Northwich, Southampton, Wakefield, and Worcester. Mr. George Brinsley, of 30 and 31, New Bridge-street, E.C., and who has been a member of the council for several years, was unanimously elected president; the vice-presidents, Messrs. B. M. Bradbeer, J. Catling, F. Everill, and W. Weatherhead, were re-elected, and twelve new applicants were admitted to membership.

CHIPS.

The Cardiff School Board have purchased a site for a new school offered by Mr. J. P. Jones in Rutland-street for the sum of £1,800, which included sewer and road formation, and upon the condition that he be appointed architect. Accommodation is to be provided for not less than 1,200 children.

In connection with the renovation of the Wesleyan chapel, Acock's Green, an oak pulpit has just been added, which greatly improves the interior effect. The pulpit, octagonal in plan, stands on a plain, well-moulded base, which is corbelled outwards at the top to carry the body of the pulpit. The top part is enriched with graceful and varied tracery set in framing having a flat ogee head. This is surmounted by a deep moulded capping which finishes it off at the top. The architects were Messrs. Croucher and Butler, of Birmingham; and the work was intrusted to Messrs. Jones and Willis, of the same city.

At St. John's the Evangelist Church, at Putney, sedilia and arcading to the north and south sides of the sanctuary have just been completed from the designs of Messrs. Lee Bros. and Pain, architects. The work has been executed in alabaster by Messrs. Adamson and Sons, builders, of Putney.

Stained glass has been introduced into the east window of the German church in Bradford to the memory of members of the Delius family. The principal subject is the Ascension of Our Lord. It is from the studio of Messrs. Powell Brothers, of Leeds.

A bust of the late Timothy Falvey, of Southampton, has been executed in white Carrara marble for a memorial committee by Mr. J. Milo Griffith, R.C.A., of London, and will be placed in the Hartley Institute at Southampton.

A tribute of admiration has just been paid to the memory of the late Dinah Maria Mulock (Mrs. Craik), who wrote "John Halifax, Gentleman," in the form of a marble medallion, executed by Mr. H. H. Armstead, R.A., and placed in Tewkesbury Abbey. The framework and treatment are Corinthian in character. Tewkesbury was the place selected by Mrs. Craik as the home of John Halifax, and it was also the last place visited by her before her death.

Building Intelligence.

BRISTOL.—Special services were held at the Mayor's Chapel, College Green, in commemoration of the completion of the work of restoration and refitting which has been in progress for the past two years under the direction of Mr. John L. Pearson, R.A. We illustrated the front of the chapel, which is also known as St. Mark's Church, in our issue of March 18, 1881, and described the general works of restoration, then just brought to completion, in the BUILDING NEWS for Oct. 18, 1889. The works carried out since the latter date have included the cleaning of thick coats of paint, by means of a chemical solvent, off the rich canopies, arches, and tabernacle work in the chancel. The new stone and wood-carving was executed by Messrs. Davey and Bushell, of Bristol. The window of the newly-erected north transept, designed by Mr. Pearson, which is 24ft. in height and 14ft. in breadth, was last year occupied by cathedral glass, but has now been refilled with stained glass of the late 13th-century character, illustrating the life, work, and associations of St. Mark; stained glass has also been placed in the reopened nave window which adjoins this transept, the subject being the Ascension. Both were carried out by Mr. Edwin Howard, of Frome. Stained glass, containing the arms of mayors of the city from 1870 to the present time, has been placed in the north and south chancel windows. A new organ has been built by Messrs. Vowles, of Bristol, and a new lectern and communion, both of polished brass, and the work of Messrs. Singer, of Frome, have been added to the church furniture.

LONDON.—The foundation stone has lately been laid, by Lady Wimborne, of a new mission church and hall in Canterbury-road, S.E., for Corpus Christi College (Cambridge) Mission. The building is on two floors, the lower floor being devoted to a large hall, capable of seating 500 people, with a platform at one end and kitchen, &c., behind. The church is on the first floor, and has chancel, sanctuary, &c., and seats about 500. It is approached by two separate entrances from the street, and has two wide stone staircases. The floors are all fireproof, of Messrs. Homan and Rodgers' construction. The architect is Mr. Richard J. Lovell, 46, Queen Victoria-street, and the builder Mr. B. E. Nightingale. The same architect has also recently completed a similar building in connection with Magdalene College, Oxford. This is in Old Nichol-street, Shoreditch. It was, however, consecrated by the Bishop of London some few weeks ago, and now forms the parish church of Holy Trinity, Bethnal-green. The building has three floors, and has a gymnasium on the basement, large hall on the ground floor, vicar's room on a mezzanine floor, and the church on first floor. It is the first instance of a consecrated church being on the first floor of an otherwise secular building. The church has a separate entrance, and is approached from the street by a wide stone staircase. All the floors are fireproof construction, on Messrs. Homan and Rodgers' system. The cost of the windows has been about £600. The chancel has marble steps and platforms, and is laid with mosaic.

LONDON COUNTY COUNCIL.—Two great metropolitan improvements—New Battersea Bridge and the street between Holborn Town Hall and Farringdon-road—were inaugurated by Lord Rosebery on Monday. We described the bridge, which replaces a rickety timber structure erected in 1766, in our issue of the 13th ult. (p. 827, last Vol.), and need only repeat that it crosses the river on five segmental arches, consisting of cast-iron ribs resting on granite piers, the central span being 163ft. The design was prepared by Sir Joseph Bazalgette, and it has been carried out under the supervision of his son, Mr. Edward Bazalgette, by Messrs. Williams, Son, and Wallington, who took the contract at £143,000. The footways are paved with Claridge's patent asphalte, with which material the approach spandrils have also been filled in, and nothing could be cleaner or more suitable for the flooring of an iron bridge. The Rosebery-avenue, the new thoroughfare running from the Holborn Town Hall to Farringdon-road, is the first section of the projected line to the Angel at Islington. By means of a viaduct it is carried over Laystall-street and Warner-street. It is 60ft. wide, and is a great improvement on the dangerous "dip" between Mount Pleasant and Clerkenwell. The delay in the opening of the entire avenue arises from the County Council having to provide dwellings for the six or seven hundred poor persons who are displaced by carrying out of the improvement.

STRATFORD-ON-AVON.—In connection with the restoration work now in progress in the chancel of "Shakespeare's Church," the first of two stained-glass windows was put in on Friday, next the American window, which is near the poet's tomb. The two windows will cost £500, and have been given by the late Miss Bromley, of Stratford. The one just inserted is on the north side, and represents the Seven Acts of Mercy performed by women as recorded in the Old Testament. The second window, which will be exactly opposite on the south side, will depict scenes from the New Testament illustrative of the Eight Beatitudes. Another stained-glass window is to be put in to the memory of the late Mr. Halliwell-Phillips. It will be placed contiguous to Shakespeare's monument. In other parts of the chancel interior the restoration is being pushed forward, and the work will be completed in about two months. The old miserere seats with the grotesque carvings are being repaired. Beneath the old stalls a curious discovery has been made. Supporting them was found the carved and moulded stone which formed the old reredos of the present chancel, which was rebuilt about 1460. The architects (Messrs. Bodley and Garner) believe that they will be able to set up the reredos in its original position. The chancel walls have been cleansed from whitewash and plaster, and some beautifully coloured work has been found about the richly-carved niches at the east end. Unfortunately, a good deal of the Gothic carvings over the doorways have been mutilated in past ages, but no attempt will be made to reinstate them. A 17th-century candelabrum, which was removed about fifty years ago, is to be put together and hung in one of the transepts.

CHIPS.

A Local Government inquiry was held on Friday, the 11th inst., at the Board schools in Evington, before Colonel John Ord Hasted, R.E., in reference to an application made by the Billesdon Union Rural Sanitary Authority for sanction to borrow the sum of £2,500 for works of private street improvement. Mr. William F. Ault, surveyor to the Board, produced plans and gave evidence in support of the application. There was no opposition. The same authority have also recently received sanction to borrow £4,937 for private street improvement in the New Humberstone district, from plans, &c., prepared by the surveyor.

It is announced in Tuesday's *Gazette* that a receiving order has been granted in the case of Herbert Bignold, of Clapham Common-gardens, London, architect; and an adjudication in the case of Frederick George Helmore, of Grafton-street, Middlesex, late of Marlborough-road, West Brook-green, and Paternoster-row, City, surveyor.

The county council of Somerset have accepted the tender of Mr. G. H. Pollard, of Taunton, at £1,580, for the erection of a police-station at Wellington, in accordance with plans prepared by the county surveyor, Mr. C. E. Norman, of Taunton.

On Saturday the Right Hon. Osborne Morgan, M.P., laid the foundation-stone of the new Town Hall and Liberal Club at Bedminster, Bristol. The hall is to face Canon-street, and will be arranged to seat about 1,500 persons. Mr. Wills, of Bristol, is the architect.

The Forest Church at Guernsey is to be reseated and restored in accordance with plans prepared by Messrs. Freeman and Robins, of Granger-street, Newcastle-on-Tyne.

Mr. Christopher Wren Savage, formerly and for many years architect to the Poor Law Board and the Local Government Board, died at his residence, Roseleigh-avenue, Highbury, on Monday, at an advanced age.

The City Council of Gloucester, at their last meeting, raised the salary of Mr. R. Read, the city surveyor, from £500 to £600 a year, out of which he is to continue to provide such assistance as shall insure the efficient discharge of his duties.

The Unopposed Bill Committee of the House of Lords on Tuesday passed the Westminster (Parliament-street) Improvement Bill, which has already been sanctioned by the House of Commons, granting an extension of time for carrying out the Parliament-street widening and other improvements in the neighbourhood of Westminster, sanctioned by Parliament in 1887.

Engineering Notes.

EDINGTON AND BRIDGWATER RAILWAY.—The formal opening of the new line of railway from Bridgwater and Edington, on the Somerset and Dorset line of railway, thus placing the town and port of Bridgwater in direct communication with the Midland and South-Western systems, took place on Friday. The contractors for the line have been Messrs. Cutbill, Son, and De Lungo (represented in Bridgwater by Messrs. Buxton and Son). The capital sought for by the promoters was £135,000. The main line is $7\frac{1}{4}$ miles in length, but with the sidings for the wharves, constructed in connection with the line on the eastern side of the Parrett, the total length of permanent way is about ten miles. There are three stations—one at Edington junction of the Somerset and Dorset Railway, another at Cossington (about midway), and the third at Bridgwater. The station at Bridgwater is situate near the junction of the Bath and Bristol roads, at the end of Monmouth-street. Mr. Owen was the engineer.

SOUTHAMPTON.—The new dock will be opened to-morrow (Saturday) by the Queen. The dock is shaped like a mason's trowel, the handle representing the entrance. This form facilitates the berthing of vessels, which can come alongside any part of the dock without the wear and tear of working to which they would be subjected in a quadrangular space. The new structure has cost about £300,000 to build. The dock has a depth of 26ft. at low water in spring tides, and Messrs. Pearson and Sons have been intrusted with its construction. Mr. Giles, M.P. for Southampton, has acted as the dock engineer, and his son, Mr. G. F. L. Giles, C.E., has superintended the carrying out of the work. The completion of the dock has been considerably delayed by the serious disasters, first to the north and then to the east walls, owing to the giving way of the foundations, and to make good the damage thus caused, an extra outlay of £50,000 has been necessary.

The Earl of Rosebery unveiled on the 17th inst., in the Crypt of St. Paul's Cathedral, a memorial to the Right Hon. W. Bede Dalley, Chief Secretary in the Ministry of New South Wales in 1884. The monument was designed by Mr. F. C. Penrose, the surveyor to the Cathedral, and the execution of the design and the medallion portrait was intrusted to Sir E. J. Boehm, R.A. It consists of an octagonal slab of grey marble, with a circular recess, surrounded by mouldings, in which are shown in strong relief, in white Carrara marble, the head and shoulders of the Australian statesman. The whole rests upon a rectangular tablet of the same grey marble, bearing in gold letters an inscription.

An inquest as to the death of George S. Butterfield, an operative painter, who died in Westminster Hospital on Monday week, was concluded by Mr. Barnes on Saturday. T. Wilder, of Palmer-street, Gravesend, deposed that he was the subcontractor for painting the extension of Queen Anne's Mansions, and deceased, a journeyman, put up the scaffolding. Deceased had no business inside the lift shaft. During the earlier part of the previous Friday witness had noticed deceased on the plank, and ordered him off. Fredk. Brown, architect and surveyor to Lucas Brothers, contractors for the Queen Anne's Mansions extension, said the board whereon deceased was supposed to have been working at the time of the accident had no support. It was fastened by some 6in. nails, and had been cut to fix and fit into the guide rails of the hydraulic passenger lift. The depth of the shaft from the tenth floor was 139ft. 2in. Henry Walker, labourer, was working at the bottom of the lift, and saw Butterfield fall from the top. Richard Lewis, the foreman to Wilder, said he had to see that the scaffolding was supplied to the workmen. There was no scaffolding to be erected in the lift. If there had been, witness would have done it himself, and would have tried it before he trusted workmen on it. Deceased must have got inside the lift to paint the sill—a thing that he had no business to do. James Boughton, foreman-in-chief to Messrs. Lucas Brothers, and superintendent at Queen Anne's Mansions on their behalf, could not account for the accident except that deceased went on the plank contrary to instructions. The jury returned the following verdict:—"We have come to the conclusion that it was an accidental death, but it has been brought about by the gross negligence of the subcontractor and his foreman, in not seeing that proper scaffolding was erected." As a rider, it was added: "And they feel they cannot rely on the evidence given by the sub-contractor and his foreman."

COMPETITIONS.

HALIFAX INFIRMARY.—Plans for this infirmary were invited from five firms of architects, two of which were local. The competitors were Messrs. Young and Hall, London; Messrs. Milnes and Murgatroyd, Manchester; Messrs. Worthington and Elgood, Manchester; Messrs. Horsfall and Williams, Halifax; and Messrs. Utley and Gray, Halifax. The plans are being exhibited in the rooms lately used as a Free Library, adjoining the present infirmary. The site is in Free School-lane, near Heath Grammar School, and is about 13 acres in extent, with a slope slightly to the east. Four of the plans show the pavilions or wards branching from a straight corridor, crossing the site from east to west, and the remaining set of plans shows a curved corridor. The assessor is Mr. Alfred Waterhouse, R.A., who, after a day's examination, chose those of Messrs. Worthington and Elgood, of Manchester, the estimate being £59,510, which were adopted. The plans placed second in point of merit were those of Messrs. Horsfall and Williams, Halifax, the estimate being £78,000. The plans will be submitted to the executive and general committee after modification.

PARLIAMENT BUILDINGS AT BUCHAREST.—It is announced from Bucharest that the Roumanian Government have determined to proceed at once with the project of a new Parliament House for the Roumanian Legislature. An international competition has accordingly been opened for the new edifice, which is to comprise two portions, one for the Senate and the other for the Elected Chamber. The competition is open to foreign as well as to native architects, and the plans are to be sent either to the General Secretary of the Roumanian Cabinet at Bucharest or to any of the Roumanian Legations, where further particulars of the competition may be obtained. For the three best designs prizes are offered of £600, £280, and £120 respectively.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BRISTOL AND GLOUCESTERSHIRE ARCHÆOLOGICAL SOCIETY.—The annual meeting of this society is being held in Bristol this week, having commenced on Tuesday and terminating to-day (Friday). On the first day the mayor and the local committee received the society at the Council House, and the opening meeting was held. The report of the council for the past year was read, and the officers and members of council for the ensuing year were elected. The retiring president, Mr. Agg-Gardner, M.P., then introduced the new president, Dr. Beddoe, who delivered an address. Subsequently there was a visit to the Mayor's Chapel, under the guidance of Mr. W. R. Barker. The Cathedral was also visited, and the day's proceedings concluded with a conversazione at the Fine Arts Academy. On Wednesday morning the members assembled at the Academy, where addresses were delivered by Mr. John Latimer and Mr. John Taylor, the former on "Civic Bristol," and the latter on "Ecclesiastical Bristol." Various places of interest were afterwards visited, and the members were afterwards entertained by the mayor and Dr. and Mrs. Beddoe. The annual dinner of the society was held in the evening at the Royal Hotel, College Green. Yesterday (Thursday) Wells and Glastonbury were visited. The concluding meeting will be held to-day (Friday) at the Council House, followed by visits to St. Mary Redcliff Church, the Hermitage, and Temple Church.

The Berlin Academy of Architecture met on Wednesday week to settle the conditions for plans for the important edifices which it is proposed to erect on the Museum Island in that city. The project emanated from the late Emperor Frederick, who also projected a new cathedral for Berlin. The expenditure on the Museum Island is estimated at fifteen millions of marks (£750,000), to which twenty millions (one million sterling) would have to be added for the proposed new cathedral.

In the list of receiving orders published in Friday's *London Gazette*, the name appears of Walter Horne, of Worthing, surveyor to the local board of health for Worthing.

The new block of artisans' dwellings, to be known as De Walden Buildings, in Henry-street, St. John's Wood, was formally opened on the 17th inst. The block contains 150 rooms, and will accommodate 50 families.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—B. H. and Co.—F. H. C. and Co.—E. F. and B.—J. and W.—A. P. Co. — Capt. H.—J. S.—W. B. F. Co.

Correspondence.

HARROGATE BATHS, WINTER GARDENS, &c.

To the Editor of the BUILDING NEWS.

SIR,—Allow us as competitors to enter the strongest possible protest against the course pursued in the final competition—viz., the stipulation in amended conditions for the latter, of special features in the sketch-plans submitted by us in the first trial—a course which, we have reason to know, lost to us the position we occupied therein.

On receiving the amended conditions we at once pointed out to the town surveyor the injustice done to us whose plans already met all the new requirements (levels only excepted), and acting upon his suggestion, refrained from seeing the referee, or writing him thereon, at once, but left it for the report upon the final drawings, when we referred thereto as follows:—

EXTRACT FROM REPORT UPON DRAWINGS SENT IN SECOND COMPETITION.

Before entering upon any description of the plans now submitted, the authors wish most respectfully to call attention to a departure in the "Supplementary Instructions" from the conditions of the first competition, which, although doubtless not so intended, may seriously affect our chance of success.

According to the "Instructions" issued for the competition by sketch plans, the usual professional course was to be pursued, the selected competitors being called upon to work out their sketch plans to a larger scale, and, of course, without any knowledge of the arrangement of others sent in; but in the "Supplementary Instructions" no less than seven points are introduced as necessary, the *whole of which were provided by our sketch plans*, in accordance with the committee's suggestion, that competitors might introduce any features likely to "prove an attraction to visitors"; thus our suggestions were all made to work against ourselves by being handed over to our opponents as requirements in the second competition.

The following are the points to which we allude, the numbers being those of the paragraphs in the "Supplementary Instructions."

2. Crane baths to be provided, bouillon-room in connection with the Aixe Massage, and Bertholet in connection with vapour baths (Bertholet by printer's error in our report being put "Berthold").

5. Smoking-room.

7. All w.c.'s to have direct external air and light.

9. Areas to be provided in the interior of the building and readily accessible from the basement.

13. Cloak-rooms, &c., for water-drinkers.

16. Doors of crane-baths wide enough for Bath chairs.

19. All pipes laid where they will be easily accessible.

The whole of these highly important features were set forth in our original plans and printed report therewith, whilst the fact of their being specially requested in the final competition shows they had not been provided by some of the other competitors. Hence we are most seriously handicapped; but, having pointed out this no doubt unintentional difficulty, we have every confidence that the referee, by awarding to us the whole of these points, will prevent the wrong which otherwise we should suffer.

The above quotation from our report speaks for itself; but not only was no notice taken of it, but from a copy before us of the committee's report on the accepted plans, we find the following improvements suggested for adoption, the whole of which were fully worked out in our plans and reports thereon—viz., a porch for carriages bringing invalids, Bertholet and vapour baths in the same room and of proper size, additional Aixe douche, needle and shower-baths to be provided, well baths for each sex, douche apparatus to length baths, kitchens for attendants, and room for thermal apparatus for pump-room. Steps at principal entrance are also to be rearranged; as to which we will only point out that as against the large number required by the accepted plan, the baths being specially designed for use of invalids, we secured the approach by only one step, and a slight easy slope on both our plans, which are still in the hands of the committee.—We are, &c.,

C. O. ELLISON AND SON.

62, Dale-street, Liverpool.

BERMONDSEY PUBLIC LIBRARY COMPETITION.

SIR,—The above competition has been decided, the commissioners and their assessor having carefully gone through and examined (?) about 60 sets of drawings, and given their award in *a week*. The result is that the commissioners have added themselves to the long list of those who have done their best to prove that competitions are, as a rule, a delusion and a snare. The selected plan shows a sublime disregard to the instructions that were issued to architects, and it seems a great pity that the commissioners, if they did not intend that the instructions should be followed, did not say so.

Special attention was drawn to the fact that there was "no right to open windows overlooking any of the adjoining windows," yet the plan which is placed first coolly ignores this, and places windows on all sides directly looking on to and into the adjoining properties.

Had he followed the instructions and kept to the same plan, his motto, instead of being "Light," would have been "Gross Darkness." His design, too, could never have been carried out for the stipulated sum, £5,000.

It would be also interesting to know how he would arrange about the "ancient lights"; because if his design be carried out, the last state of those lights would be worse than the first.

I have been able, too, to obtain a little information as to how the award was arrived at. The commissioners met, and such was those gentlemen's grasp of the subject, that in a few hours' out of about 60 sets they selected eight. These in their turn were passed on to the assessor, Mr. Elkington, the surveyor to the parish, who, I presume, reported on them then before the designs were *publicly* exhibited; the commissioner wrote to the author of the design with the motto "Light," and had an interview with him, with the result that his design was adopted *after* he had agreed to several alterations, and after having an opportunity of going through the whole of the other designs. This, I think, you will agree with me, is hardly the right way of settling the matter, inasmuch as there were plans infinitely superior in every way to the ones selected.—I am, &c.,

X. Y. Z.

THE WEST HARTLEPOOL BREWERY COMPETITION.—WHAT *IS* THE GOOD OF THE INSTITUTE?

SIR,—I regret very much the fact of having brought this matter before the Council of the Institute, as their reply is most disappointing; and although they do not actually approve of the

manner in which this competition has been conducted, they do not express any disapproval, or give any expression of opinion one way or the other. This reply, or the wording of the same, has placed me in such a position that my hands are tied with regard to proceeding further in it.

Having given an undertaking to the Institute to forbear entering into competition where an assessor is not appointed, it is surely only natural to suppose that a certain amount of protection will be afforded by the Council to the members of the Institute when anything unsatisfactory takes place in a competition where an assessor is said to have been appointed?

Thanking you for the amount of trouble you have already taken,—I am, &c.,

WILLIAM H. DUFFIELD.

2, King-street, Cheapside, E.C., July 19.

OLD CHURCH FRESCOES.

SIR,—As many of your readers have been interested in the restoration of old churches, I, and doubtless many of your readers, would be glad if they would give us the benefit of their experience of the best mode of procedure to remove the superincumbent coats of plaster and whitewash without injuring any frescoes underneath, and also state if there is any preparation to preserve them from fading away afterwards, through exposure to sun and light.

My experience in church restorations confirms my belief that most of our old churches should have their walls aglow with colour, instead of the "restored" bare aspect they now wear, and that through want of knowledge and proper care many links of the past are lost for ever.

The fine church of Ewelme, near Wallingford, is an instance of its walls bearing indications of many a fresco under the coats of whitewash, and the interesting frescoes around the chancel of Chalgrove Church, close by, are fast fading away on the north side (where the Life of Our Lord is depicted), from exposure to the sun; while those on the south side (illustrative of the Life of the Virgin) are almost as clear as when uncovered in 1883.—I am, &c., A. MARDON MOWBRAY.

48, Iffley-road, Oxford, July 19.

Intercommunication.

REPLIES.

[10317.]—**Excavation.**—If "Student" deducts the cubical space occupied by the sewer, he will not be far wrong, as the earth filled in should be well rammed and consolidated.—H. L.

[10319.]—**Architect's Designs.**—I am afraid that "A. R." has no remedy, although he evidently does not feel flattered, as he might do. Some of the greatest architects have their works imitated, with more or less success, by members of their own profession.—H. L.

[10318.]—**Specifications.**—The standard work on this subject is that by the late Professor Donaldson. Some years since (1872), Mr. F. Rogers published a new edition of "Bartholomew's Specifications," which included many modern works; and I think that another edition has been issued more recently. Several specifications have been given in the BUILDING NEWS in "Practical Architecture." At the present day, specifications are hurriedly written. "Inquirer" should practise by writing from a well-detailed set of drawings.—H. LOVEGROVE.

A majority of the Improvement Committee of the Southport Corporation have approved a scheme for developing the north foreshore on the lines laid down by a plebiscite. A duplication of the existing marine park and lake is provided for. The north promenade will be widened and a carriage-way provided to the sands; but the setting back of the pier entrance is not included. The proposed new lake covers 25½ acres. It is intended to borrow £25,000 to carry out the scheme.

A church to seat 250 persons is being built at Beaufort, Mon., for the Rev. D. J. Llewellyn. The contract, which includes furniture and heating, has been taken by Mr. John Haines, of Cardiff, for £970, making the cost at per head a little less than £4. The plans have been prepared by Messrs. Halliday and Anderson, of Cardiff and Llandaff. A mission-room to seat 150 persons has recently been opened by the Lord Bishop of Llandaff at Cymmer, near Bridgend. The designs were by the same architects.

Arrangements are in active progress for the holding of the third Annual Art Congress at Birmingham in November next. The meetings will be held in the Town Hall, the Mason College, and the lecture theatre of the Midland Institute, and will be opened by the President's address on November 4th.

LEGAL INTELLIGENCE.

IN RE J. E. EDWARDS.—Mr. Registrar Hazlitt heard on Friday an application by John Edward Edwards for an order of discharge. He had traded as a builder in Campbell-road, Bow, and his statement of affairs showed liabilities to the amount of £2,105, and the Official Receiver certified that the assets had realised £83. The debtor commenced business as a speculative builder in 1886, with a capital of £80, and in 1888 he became bankrupt, with liabilities £2,695, on which a dividend of 3s. 2d. in the pound was declared. He received his discharge in November, 1888, and in the following month he resumed business. He attributed his failure and the deficiency upon his trading mainly to his inability to realise houses which he had erected at West Hampstead, and to the stoppage of advances on other hourses in course of construction. His Honour said that the debtor, after a recent failure, rushed again into speculative building. He was not a fit person to pose as a trader, and his order of discharge would be suspended for three years.

IMPORTANT EMPLOYERS' LIABILITY CASE.—On Monday last his Honour, Judge Prentice and a jury heard, at the Shoreditch County Court, the case of "Luther v. Patman and Fotheringham." It was an action brought by Thomas Luther, of Shaftesbury-street, Hoxton, to recover damages, under the Employers' Liability Act, for personal injuries alleged to have been received through the negligence of the defendants' servants.—Mr. J. Morten was counsel for the plaintiff, and Mr. Ruegg appeared for the defendants.—The plaintiff's case was that on the 24th of September last he was at work as a bricklayer for the defendants upon some buildings at Charing-cross. A scaffold had been erected, and he was at work upon it. There was an open window hole near the spot where he was standing, and his foot slipped and he fell through the hole, which was between 6ft. and 7ft. long, and between 2ft. and 3ft. wide. He fell on to his back, which was injured. He was taken home and afterward removed to a hospital. He was for seventeen weeks without work, and he now found that his back still pained him; he was unable to do the work so well, and with such facility as before the accident. Evidence was given by Henry Hadby, a scaffolder on the job, that when the bricklayers were sent up to work the scaffold was not finished, and witness said, at the time: "Give us time to finish it." He took the plaintiff to the hospital, and when he returned he found that the hole had been covered. Another witness named Ayling, who was also at work, said it was usual to cover up such openings like the one the plaintiff fell through, and he made the remark to Donoghue, the foreman scaffolder, that there should have been a short board across the hole. John Bowers, a general labourer, said that after the accident Donoghue, the foreman scaffolder, said: "Well, what can you expect? They don't allow us time to get the scaffold up properly before they set the bricklayers on it." After Donoghue had gone, Mr. Adams, the general foreman, came up and said, referring to the hole, "Why was it not boarded over?" Mr. Adams said that to Beazley the foreman bricklayer.—Mr. Ruegg severely cross-examined this witness, but he persisted in his statements. A great deal of evidence was then given for the plaintiff to show that it was the custom of the trade to cover such spaces. Mr. Ruegg then called Mr. Chaunley for the defence. The witness stated that he was manager to the defendants. He remembered the plaintiff calling on him shortly after the accident, and asking him for some assistance. The plaintiff stated that he did not blame anybody for the accident. He (witness) was a practical man, and it was not the custom of the trade to cover such places, except for the purpose of running materials away. He had never had any complaints from the men as to any danger, and he had never heard of a case before of a man falling through a window. Samuel Adams said he was the general foreman on the job; it was not his custom to cover with boards such openings. He went on the scaffold after the accident, but it was not true that he said "Why is it not boarded over?" In cross-examination, witness said that he really did not recollect what he did say. His foreman, Saunders, said he had put a few boards over the hole "to keep some other fool from falling down." This remark was greeted with hisses from the public in court. John Beazley said he was the foreman bricklayer. Hadley did not say the scaffold was not finished. The statement that Adams asked witness why the opening was not boarded over was also untrue. It was not the custom to do so. In cross-examination, witness said that they were hurrying on with the work. Adams and witness had no conversation about the matter whilst they were on the scaffold. If it had been necessary, the hole would have been covered up. It would have been a good precaution to cover up the hole. It would have been desirable, but it was not necessary. He did not think a man could fall through unless he stepped from one scaffold to the other—from the outer to the inner. Thomas Donoghue said he erected the scaffold, and did not think it necessary to cover up the opening. The witness contradicted the witness Bowers as to the alleged remark made by him (witness) as to not being allowed sufficient time. The bricklayers were at work on the scaffold whilst his men were erecting it. This remark was greeted with laughter and "Hear hear" from the back of the Court, and in answer to Mr. Ruegg the learned judge said he took no notice of the interruptions, and the jury were too sensible to be affected by them.—For the defence experts were then called to show that it was not the custom of the trade to cover such openings.—In his address to the jury Mr. Ruegg said that if they found a verdict for the plaintiff they would convict every builder in London. He contended that there had been no negligence on the part of the defendants. The affair was simply an unfortunate accident. Mr. Morten having replied upon the whole case, the learned judge summed up.—The jury having retired for about a quarter of an hour, returned into court and announced that they found that there had been negligence on the part of the defendants in not covering up the hole, and they awarded the plaintiff £40 damages. They also found, however, that the plaintiff knew of the risk "he ran," and "voluntarily" accepted it.—Upon this, Mr. Ruegg asked for judgment for the defendants, and his Honour assented. Mr. Morten said he should appeal, on the ground that the learned judge had not explained to the jury the meaning in law of the word "voluntarily."

CHIPS.

The new church of St. Mark, Bush Hill-park, near Enfield, is about to be commenced. The first section, which excludes the south aisle, will cost £3,500, and is being built by Mr. J. Tyerman, of Walworth-road, S.E. Messrs. J. E. K. and J. P. Cutts are the architects.

On Thursday in last week, in the Philharmonic Hall, Southampton, in the presence of the assembled students and members of the committee, Mr. J. C. Peak presented, on behalf of the students (past and present) of the School of Art, committee, and friends, the head master (Mr. S. C. Seaward) with a set of valuable wedding gifts, on the occasion of his approaching marriage.

Mr. A. A. Langley, who for many years has been engineer-in-chief to the Midland Railway Company, has accepted the position of consulting engineer to that company.

Mr. E. Davies has been elected surveyor to the Llangollen District Highway Board, in succession to Mr. Evans, who had obtained the appointment of surveyor to the Carnarvonshire County Council.

Sir Lyon Playfair opened on Saturday afternoon, in Knatchbull-road, Camberwell, a new public library, which has been given to the joint parishes of Lambeth and Camberwell by Mr. Minet, who last year gave the extensive space known as Myatt's Fields, close to the gates of which the new library stands. Mr. Minet has also given to the district a large hall, which has been erected in the same road.

A new patent elevating ferry steamer, which has been designed by Messrs. W. Simons and Co., of Renfrew, was opened at Finnieston, Glasgow, on Friday, by the Clyde Trustees. It is adapted for both passenger and carriage traffic, and is 80ft. by 43ft., and its depth amidships is 12ft. The vessel is subdivided into thirteen watertight compartments by iron bulkheads. The main deck is iron, and beneath it is accommodation for the crew. Its distinctive feature is an elevating deck platform (in addition to the ordinary deck) which extends the whole length of the vessel, and occupies two-thirds of the breadth. Supported by six steel columns of box section, the platform from its lowest position rises to a maximum height of 15ft. by six large steel screws placed inside the upright columns. The ferry is thus able to embark and land passengers on the quay or landing-place irrespective of the rise and fall of the tide. The steamer has accommodation for 300 passengers, besides eight loaded carts and horses, or if passengers only, 600 to 700. Having no chains, the Simons ferry is not confined to one berth, but can move from one point of debarcation to another.

The House of Lords Committee, which has had under consideration this week the Bill for the removal of the gates and bars across certain streets in London, heard on Wednesday the evidence of Mr. A. Binnie, the engineer to the County Council, as to the obstruction to traffic caused by the gates in question. He added that he had never known compensation paid for the removal of such obstructions.

The Devon County Asylum, Exminster, is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

Jean Gautherin, a talented sculptor, repeatedly medallist at the Salon, died on Monday of congestion of the brain at the age of 49. His "Paradise Lost" is a well-known piece of sculpture.

STATUES, MEMORIALS, &c.

LICHFIELD CATHEDRAL.—The memorial erected to commemorate the life and work of the Ven. John Hodgson Iles, late archdeacon of Stafford, was unveiled in this cathedral on Monday by the Bishop of Lichfield. The memorial takes the form of an effigy, which has been placed on the east side of the north transept steps, near the organ, and has been executed by Mr. W. R. Ingram, of London, who some years ago supplied a number of the figures for the west front of the cathedral. The effigy represents the late archdeacon in a recumbent position wearing his official robes, and with his hands crossed over his breast, clasping a copy of the Holy Scriptures. The figure is placed on an altar tomb with Gothic mouldings, the whole being executed in Caen stone, and on the front are three panels bearing the following inscription:—"John Hodgson Iles. Died 1888. Aged 61. Rector of Wolverhampton 1860-1876. Archdeacon of Stafford. Canon Residentiary of the Cathedral. 'Not slothful in business, fervent in spirit, serving the Lord.'"

WATER SUPPLY AND SANITARY MATTERS.

ALVASTON AND BOULTON SEWERAGE.—At a special meeting of the Alvaston local board held on Friday, July 11, it was decided to instruct Mr. W. H. Radford, C.E., of Nottingham, to prepare a scheme for the sewerage of the district. The district to be drained includes a rapidly-increasing suburb of Derby.

CHIPS.

Colonel Ducat, R.E., held an inquiry at Colwin Bay on Tuesday, touching an application from the local board for powers to borrow £5,250 in respect of the construction of a subway to the beach, and £750 for the formation of a footway and promenade. Mr. W. Jones, surveyor to the local board, described the construction of the proposed footways and promenade, adding that the subway under the railway would be constructed by the North Western Railway Company, who had furnished no estimates or plans, but had undertaken to do the work themselves for a lump charge of £3,500.

Alterations have been made to the Accrington Spinning and Manufacturing Company's mills, embracing the ventilation, the extraction of the vitiated air now being effected by the latest improved form of Messrs. Robert Boyle and Son's self-acting air-pump ventilator.

Mr. John Rhind, of Edinburgh, has just modelled in plaster three panels for the pedestal of the Chambers Memorial Statue, which is to be erected in Chambers-street, Edinburgh, opposite the entrance-door of the Museum of Science and Art. The figures, female in each case, are symbolical of Literature, Liberality, and Perseverance.

The sale of the 176 pictures collected by the late Mr. Charles Wells, of Berrington Lodge, Wolverhampton, realised on Tuesday nearly 11,000 guineas.

A large hall has been added to the Higher Tranmere, Birkenhead, High School for Girls, 35ft. by 26ft., with recessed bay window, which will accommodate about 200 persons; also large room below of same size for cloak and playroom, with extended lavatories, the whole costing about £800. Mr. James N. Crofts, of Liverpool, was the architect; Mr. John Shaw, of Birkenhead, the builder. The concrete and wood-block flooring are by Mr. Lowe, of Farnworth.

The exhibition of the works submitted for the National Art Competition, 1890, by the schools of art throughout the kingdom will be opened to the public on Monday next, the 28th inst., and will remain open until the end of August. The works will be on view in the Enamels Gallery of the South Kensington Museum.

A committee of the Dundee Water Commission have recommended that body that Mr. Watson, the engineer, receive an honorarium of 250 guineas for the extra work imposed on him in preparing Parliamentary plans, &c., for the proposed extension of the waterworks, which is estimated to cost about £50,000. It was arranged that from January next Mr. Watson's salary should be raised from £500 to £600 per annum, this increase to cover the preparation of Parliamentary plans and the execution of new works in the future.

Further additions have recently been made to our knowledge of old Chester by the excavations for cellarage made in Watergate-street by Mr. Charles Brown, formerly mayor of that city. The base of a Roman column was uncovered, and will be left *in situ*, an arch being built over it to preserve it; above this was found a 14th-century stone coffin and carved gravestone.

The Stainland local board have appointed Mr. G. H. Crowther as engineer for the proposed works of water supply from Coldacre, at an inclusive retainer of £500.

Our Office Table.

MR. TATE'S offer of his collection to the nation as the nucleus of a National Gallery of British Art, although looked at askance by the Government, is being warmly and substantially supported by art patrons. Mr. William Agnew, M.P., urges that the site of Kensington Palace is the best one for such an institution, and puts the matter into practical form by offering "not less than £10,000" towards the £100,000 which he considers would be ample to provide a good sculpture gallery, four or five for oil-paintings, and others for water-colours and engravings. Towards the same object Mr. Harry Quilter also promises £2,000. Such gifts will stimulate the liberality of other wealthy connoisseurs, and although we cannot agree with Mr. Agnew in his selection of Kensington Palace as the ideal situation for such a gallery, we trust that Mr. Tate's collection will be secured for the public and worthily housed.

MR. DAVID DAVIES, M.P. for Cardigan District from 1874 to 1885, died on Sunday, aged 72 years. As a railway contractor, he carried out extensive undertakings in South Wales. Between 1851 and 1862, in partnership with the late Thomas Savin, he made the Llanidloes and Newtown line, the Vale of Clwyd line, and the Oswestry and Newtown Railway. After the partnership with Mr. Savin was dissolved, he joined the late Ezra Roberts in making the Pembroke and Tenby Railway, and other lines. Subsequently he threw his whole energies into the development of collieries in South Wales, and became one of the wealthiest men in the Principality. He was the principal promoter of the Barry Docks and Railway, and became vice-chairman of the undertaking, which has proved a great success.

A PUBLIC MEETING was held on Wednesday, under the auspices of the Plumbers' Company, at the Kensington Town-hall, presided over by the Rev. E. Carr Glyn, M.A., with the object of considering measures whereby the technical and scientific education of apprentices and other plumbers may be systematically insured, and the public protected against the action of unqualified plumbers. Sir Algernon Borthwick, M.P., read a report, stating that some of the registration committee had urged that statutory powers be applied for to consolidate and enforce the registration system, and render it penal for persons to falsely represent themselves as registered plumbers; also that investigations be made to determine the suitability of some of the materials and systems used in plumbing work, which could not be undertaken by private individuals. It was suggested that a better system of apprenticeship be adopted, and that apprentices should go through an educational course and present themselves for periodical examinations. He moved the adoption of the report; also a resolution declaring that "the progress of the system affords indisputable evidence of its having satisfied public requirements, and in a marked degree commands the confidence of sanitary and other authorities." Lord Lorne seconded the resolution, which was agreed to. Professor Garnett moved and Professor Hicks seconded—"That effective measures should forthwith be taken for securing a systematic training and instruction of plumbers' apprentices, and education in the branches of science and technology required by persons engaged in works affecting the sanitary condition of dwelling-houses and other buildings in respect of their water supply and drainage, and that the object can only be satisfactorily attained by the combined action of plumbers and technical authorities throughout the kingdom in accordance with the proposal of the Worshipful Company of Plumbers, which is worthy of approval and support." Attention was, by a further resolution, directed to the anomalous circumstances that, while it has long been the practice to require that those dealing with matters affecting the health of the community should possess sufficient training and prove their qualification before undertaking their duties, there is not at present any corresponding safeguard to the public in respect of plumbers.

Mr. Edward Large, formerly Government engineer at Melbourne, died at Boulogne-sur-Mer, France, on Saturday, in his 68th year.

Holloway's Ointment and Pills are never at fault in successfully disposing of skin diseases, scrofulous sores, and scorbutic affections. In all hereditary diseases these excellent remedies may be relied upon, and by their means the most delicate may become strong; the foulest blood may gradually be changed into the purest fluid.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful COLOUR of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ANNSCROFT, SHREWSBURY.—For the erection of additional farm-buildings at Stoneyford, for Mr. W. Brown:—
Southern, W. W., Nobold, Shrewsbury, (accepted) £130
(Lowest of three tenders received.)

BOSTON.—For machinery for the new grain warehouse, for the harbour trustees:—
Stott and Co., Manchester (accepted) ... £1,218

BRIXHAM, DEVON.—For alterations and additions to the Bolton Hotel, for Mr. J. Bartlett. Mr. G. S. Bridgman, M.S.A., Torquay and Paignton, architect:—
Hazlewood Bros. (accepted).

CARDIFF.—For the erection of new schools for 290 children, in the parish of St. Mary the Virgin, Cardiff, for the Rev. G. A. Jones, M.A. Mr. F. J. Veall, Arcade Chambers, High-street, Cardiff, architect. Quantities by the architect:—

Lock, F. S.	£1,733	0	0
Allan, J.	1,696	0	0
Gibbon	1,613	0	0
Thomas, W., and Co.	1,597	0	0
Haines, J. (accepted)	1,577	0	0

All of Cardiff.

CANONBURY.—For works and redecoration of Trinity Presbyterian Church, Canonbury, N. Mr. R. Annan, Highbury, N., architect:—

O'Dyly and Co., Ltd.	£362	0	0
Flaxman, G.	243	0	0
Taylor and Son (accepted)	231	0	0
Gasfitter's work:—			
Taylor and Son (accepted)	69	0	0

CHILD'S HILL, MIDDLESEX.—For enlargement of All Saints' Schools. Messrs. Tatham and Flower, 15, Clement's Inn, architects:—

Dove Bros.	£545	0	0
Burford and Son	509	0	0
Lawrence, E., and Son	595	0	0
Parkinson and Son	498	0	0
Scrivener and Co (accepted)... ...	478	0	0

CLERKENWELL, N.—For the erection of a school for 2,006 children on the Hugh Myddleton site, Clerkenwell, for the London School Board. Mr. T. J. Bailey, architect:—

	A.	B.
Patman & Fotheringham	£45,396 ... £46,096	... £45,496
Colls and Sons	44,075 ... 44,766	... 43,956
Killby and Gayford ...	43,820 ... 44,540	... 43,720
Grover, J., and Son ...	43,577 ... 44,267	... 43,567
Lawrance, E., and Sons...	42,534 ... 43,238	... 42,584
Dove Bros....	41,505 ... 42,580	... 42,520
Mowlem, J., and Co. ...	41,448 ... 41,938*	... 40,938
Pattinson, S. and W.† ...	38,312 ... 38,939	... 38,000

* Accepted. † Withdrawn on account of error of omission amounting to £2,188 18s.

A.—If brickwork be built in cement. B.—If brick facing be substituted for terracotta facing.

The provisions included in the tender amount to £2,563 11s. for the main school, £203 for the deaf and dumb centre, and £74 for the blind school.

[(*a*) Cost of school buildings only, £27,603; (*b*) six teachers' rooms for main school, £600; (*c*) blind school and single cookery centre, £1,572; (*d*) one teachers' room for ditto, £100; (*e*) deaf and dumb centre, £3,567; (*f*) two teachers' rooms for ditto, £200; (*g*) tar pavement playgrounds, and drains, £3,150; (*h*) boundary walls and gates, £850; (*i*, *j*, and *k*) extra depth of foundations, £2,836; (*l*) works to existing buildings, £1,270; brickwork in cement (less credit of £300 for old bricks), £490; total, £41,938. Cost per head of (*a*), £13 15s. 2d.; total cost per head, £20 18s. 1d.]

DAWLISH, DEVON.—For erecting eight cottage residences, for Mr. E. R. West. Mr. G. S. Bridgman, M.S.A., Torquay and Paignton, architect:—

Pepperell, W....	£1,915	0	0
Chudleigh, L....	1,879	0	0
Friend, S.	1,804	16	0
Cundy and Stoyles	1,698	10	0
Lamacraft, J. H.	1,684	10	0
Webber, H., Paignton	1,590	0	0
Rabbick and Brown, Paignton ...	1,549	0	0
Hatcher, W. H., Dawlish	1,489	0	0
Westcott, J.	1,440	0	0

(It is intended to accept the lowest.)
Rest of Dawlish.

DALSTON, N.—For the enlargement of the Wilton-road School, Dalston, by 400 places, and also the provision of a cookery centre on the site, for the London School Board:

	A.
Grover, J., and Son	£5,208 ... £5,309
Kellaway, W. L....	4,989 ... 5,086

Longley, J., and Co., Crawley, Sussex	4,295 ... 4,414*

* Accepted.

A.—If brickwork be built in cement.

[(*a*) Cost of school buildings only, £4,223; (*b*) tar pavement and playgrounds, £24; (*c*) extra depth of foundations, £38; brickwork built in cement, £119; total, £4,414. Cost per head of (*a*), £10 11s. 7d.; total cost per head, £11 0s. 8d.]

GRIMSBY.—For building new school, for Sister Evangelist of the Convent, Nottingham, Heneage-street, Grimsby. Mr. E. W. Farebrother, F.R.I.B.A., Grimsby, architect:—

Marrows, H. (accepted)	£380	0	0

(Lowest of four tenders.)

GRIMSBY.—For building new braiding rooms, Grimsby, for the Great Grimsby Ice Co., Ltd. Mr. E. W. Farebrother, F.R.I.B.A., Grimsby, architect:—

Kirk, N.	£421	0	0
Hewins and Goodhand	343	0	0
Chapman, J.	338	0	0
Smith, W. H.	334	0	0
Wilkinson, J.	308	19	6
Nightingale and Danby	299	0	0
Siminson, T. (accepted)	293	0	0

All of Grimsby.

GRIMSBY.—For building new Apprentices' Home, Victor-street, for the Great Grimsby Ice Co., Ltd. Mr. E. W. Farebrother, F.R.I.B.A., Grimsby, architect:—

Guy and Gooseman	£4,338	0	0
Walker and Cook	3,778	0	0
Marrows, H.	3,722	0	0
Siminson, T.	3,693	7	8
Hewens and Goodhand	3,681	15	0
Thompson, J. R., & Sons, Louth*	3,575	0	0

* Accepted.

Rest of Grimsby.

GRIMSBY.—For alterations and additions to the offices and works of the *Grimsby News Co.* Mr. E. W. Farebrother, F.R.I.B.A., Grimsby, architect:—

Thompson, J. R., and Sons, Louth	£249	0	0
Walker and Cook, Grimsby... ...	235	0	0
Grey and Gooseman, Grimsby* ...	195	0	0

* Accepted.

GRIMSBY.—For new shop-fronts, for Mr. C. Jeffs, Grimsby. Mr. E. W. Farebrother, F.R.I.B.A., Grimsby, architect:—

Manows, H. (accepted).
(Lowest of four tenders.)

HAWKSLEY'S PATENT TREADS.

Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.

Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

AND ENGINEERING JOURNAL.
VOL. LIX.—No. 1856.
FRIDAY, AUGUST 1, 1890.

THE NATIONAL COMPETITION OF SCHOOLS OF ART.

THE works submitted for the annual competition for prizes, now open to the public in the gallery of the South Kensington Museum, is a satisfactory representation of the progress made in the art schools of the department. Out of the 233 schools of art and branch schools, 54,780 works were sent up for examination; over 43,000 from 317 science schools, and 37,761 works from 265 art classes. Of this large number 2,084 works were selected for competition, and only those awarded medals and Queen's prizes have been exhibited. We naturally turn first to the architectural and decorative art designs. As usual, there is very much that is feeble and commonplace; by feeble we mean want of a truthful motive and purpose in design, and this quality appears in some of the premiated works. This year a gold medal has not been awarded to any architectural design; few towns represent the winners. These are Burnley, Dublin, Glasgow, Manchester, and South Kensington. The designs for architectural subjects which take silver medals come from Chester, Manchester, and Sydney, New South Wales. We may first notice the design for a church by Heber Rimmer, Chester. The design is intended to show the styles of architecture from the 12th to the 16th century—a very ingenious idea certainly for instructing a student in the styles of English architecture, but one that appears to us to be a most mistaken view for teaching the art and science of architectural design, which is the main object of the Science and Art Department. Looking at the design in the first-named aspect, the author displays considerable knowledge of style, especially of the two latest, the Decorated and Perpendicular. The Norman and Transitional parts in the apse and transepts are less satisfactory. The apse is lumpy, the three-light windows are out of proportion. The nave of Decorated work is better, and there is a fair sense of proportion and detail. The square and rather low tower over the crossing is characteristic. The design by Charles Townson, of Barrow-in-Furness, awarded a bronze medal, and shown by ink line drawings, has a plan comprising nave and aisles, chancel, tower and spire at west end. The style is of the Decorated or 14th century type. The author has shown his knowledge of the general features of this period. His proportions are pleasing, and there are breadth and quiet treatment in the design and details, especially of the west end and tower and spire. The examiners say the square orders of the doorway are not characteristic of the style: perhaps it is not a general type; but nevertheless there are examples in which the main groups of mouldings are arranged under three square outlines. Certainly, as a design, the work is worthy of a silver medal. F. W. C. Gregory, Nottingham, takes a book prize for a design for a cruciform church with rather a heavy and extravagant tower and spire, the style Florid Decorated. The drawing in ink is firm, and the details show knowledge of the style. A silver medal has been given to a Sydney student, J. A. Kethel, for a design for a colonial mansion, in the Italian style of two orders, the merits of which are at best of a commonplace kind; but the examiners considerately thought that it should not be judged by the same standard as designs by home students. The plan is symmetrical, an open colonnade surrounding the house on three sides. The perspective is correct and neatly drawn. The plan itself is crude and formal, the offices are small, and the general conveniences ill arranged. A bronze medal is given to W. H. Martin, Birmingham, for a design for a museum and library—a Classical scheme, rather rigid, segmental pediments at the ends, and a lofty centre dome. The dome is out of proportion, and the details display ignorance of the style. The same medal is awarded to C. B. Howdill, Leeds, for the design for a public school. The square plan has an assembly-hall and six classrooms on each floor. The front is jumbled, and a low storied building, occupied by cloakrooms and other offices, appears tacked on to the high block behind it, forming the school, its lowness being rendered more apparent by the lofty tower which springs from it. Equally doubtful as a work of merit is the design for town hall, by E. T. Heazell, Nottingham, a rather poor building of a Late Gothic character, and exceedingly feeble in drawing and design, but for which a bronze medal is given. Another Sydney student, P. E. Malumby, takes this prize for a design for a bachelor's residence, Classic in style, and with a plan forming a cross, utterly impracticable as a design for a temperate climate and too much like a temple. There are four pediments with flights of steps to each front, and the interior is sacrificed to the Classic formula. The diamond-shaped panelling and other details of the inner doorways are in ill-keeping with the style. A bronze medal goes to F. B. Cooper, Leicester, for a town house, a design of considerable merit. The drawing shown is a large-scale elevation, coloured, in a 17th-century style in red brick and terracotta with a pavilion roof—the details and panels of ornament well drawn. The plans show a fairly good arrangement.

Prizes of books are awarded to several Leicester students—to W. Grewcock for a design for a village inn, a nice brick and half-timbered gable being shown; also to H. G. Riddett for a brick and stone vicarage; to E. R. O. Davis, for a simply-treated lodge and small stables of brick and half timber; and to W. Langley for a nice coloured drawing of front for village shop stuccoed, with red tile roof. The same prize is given to W. H. Cowlishaw for a carefully-drawn country parsonage; but the perspective is too heavily shaded or hatched, and the distant church on hill is out of perspective. Though there is considerable ability shown in these exercises, more attention is required to the essentials of good construction. Sections are conspicuous by their absence. Unfortunately, the students are taught by a wrong method—the style is fixed upon before the plan has been designed, instead of proceeding from requirements to an expression of style.

The architectural drawings from measurement include several examples of creditable draughtsmanship. Arthur H. Hind, Leicester, obtains a silver medal for drawings of panelling of St. Vincent's Church at Rouen and other sketches. The panelling is drawn in brown ink. Other pencil sketches of St. Maclou stairs and porch are interesting, and details of sedilia, Cassington; buttress head, Gaddesby, &c. A bronze medal goes to W. B. Savidge, Nottingham, for drawings of Church of St. John the Baptist, Tideswell—an interesting type of church with a long chancel, nave and aisles, and western tower, of Late Decorated and Perpendicular. Details of the tracery, arcade, doorways, &c., are shown. We notice the same award given for drawings of Tomb of Lord de la Warre in Broadwater Church, Sussex—a heavy and Late Gothic canopied monument—to two Brighton students, George P. Fisher and Chas. E. Georges. The sepia drawing of doorway, Aston Hall, by Walter Freeth, Birmingham, takes a similar prize; J. Smieton, Dundee, also receives it for drawings of the old church at Leuchars, Fifeshire, with some interesting arcading and circular apse of Norman date. H. Walker, Banbury, takes a book prize for a neat drawing of an oak pulpit in Orton-Waterville Church, a carved Renaissance example; also F. G. Wood, Manchester, for a sepia drawing of the Picton (miscalled "Pigeon" in official list published) Reading-room, Liverpool, with details. Amongst other book-prize drawings we notice those of Aston Hall, including details of chimney-piece and grand staircase, by W. F. Edwards, Birmingham; by O. Middleton, Peterborough, some ¼in. scale drawings of a bay of the cathedral and doorway of St. Leonard's Priory; drawings of the Royal Naval College, Greenwich, to a large scale, with minutely figured dimensions by G. Harvey, Polytechnic; drawings of monument in Holland, by H. Allen; of the Angel Choir, Lincoln, a finely-executed line drawing of this beautiful example by J. R. Halkes, Lincoln; of the elegant Tomb of Walter Gray, Archbishop of York, by J. Hamer. Though exceedingly fine outlines, the latter drawings miss the spirit and character of the detail and foliage. In this category we may also notice J. H. James's drawings of the Lady-chapel, Llandaff Cathedral, drawn to a 2ft. to the inch scale, with details; of doorway, &c., of mansion at Elstow, in sepia; and of Corinthian Tower, Brighton, by C. E. Georges. To students of the National Training School are awarded silver medals for shaded drawings of the Temple of the Sun; C. Ripper and H. Allen send cleverly-executed drawings; J. J. Hamer and J. W. Comley receive bronze medals for the same subject. Prizes in bronze are given also to J. W. Allison, G. Scott, A. Shuttleworth, and W. H. Osmond for drawings of monument finely executed in outline from a cast in the S. K. Museum.

In Stage 23, comprising designs and decorative products, we can only name a few of the contributions. These include carpets, printed tiles, mosaic floors, wall-papers, cotton hangings, lace, embroidery, silver plate, wrought ironwork, book-bindings, decorations, &c. Archibald Walker, Glasgow, takes one of the gold medals for design for a Persian carpet, in which foliage and animals are well arranged on a green ground, boldly conceived. The filling and border are well contrasted in colour. Designs for printed tiles, by L. P. Butterfield (gold medal), Kensington, exhibit a clever disposition in two colours; also one in which two blues are introduced by printing, the other colours being laid on by hand. W. T. Done, Hanley, has a silver medal for a carpet design in the Persian style, cleverly disposed, and in nice colours: the repeat is not easily traced. E. Hodgkinson, Manchester, also wins the medal for a design with flowers and foliage on a blue ground. The wall-papers are not remarkable for any special merit in design. We notice Paulina Shepherd, a South Kensington student, wins a silver medal for a paper with a folial arrangement and flowers in nice colours; John H. Cantrill, Manchester, takes a bronze medal for a bold design. L. P. Butterfield, South Kensington, has a successful arrangement with flowers. Dora Robinson, Manchester, shows a clever disposition of foliage and flowers on a dark-green ground in five colours. In these and other designs fancy and inventiveness are shown, but the repeats are not always worked out. A bold pattern in green and yellow is shown for an Eastern finger carpet by F. J. Donohue, a Kensington student (book prize). A silver medal goes to Gertrude Roots, Canterbury, for a mosaic floor design in delicate colours, of blue, buff, and light-green; the arrangement of polygons intersecting is clever and out of the common. Another pleasing design for a

hall-floor, by Thomas Barrett, of Macclesfield, receives a book prize, in which medallions are introduced; it is quiet and in subdued colours. The same prize is given to a Hertford student, Evelyn D. Foster, for decoration in mosaic, in which intersecting circles are treated with good taste.

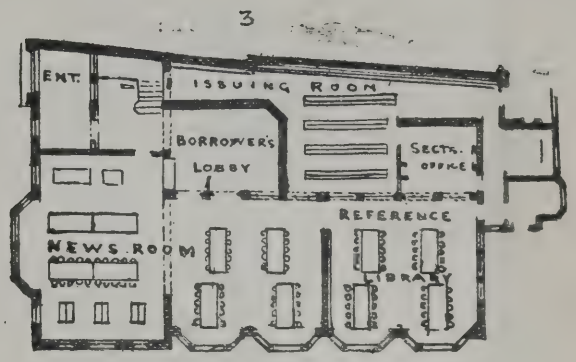
W. Holt, of Burnley, has the gold medal for a printed cotton hanging, the merits of which are doubtful. We do not like the arrangement of quaint figures, sheaves of wheat, and flowers—it is thoroughly in the style of the 17th century; the colours are somewhat tawdry and harsh. Emily C. Brothers' design (Canterbury) receives a silver medal—a cleverly-disposed treatment of birds and foliage in greens and buffs. For cotton prints, R. V. Green, Manchester, has well won a bronze medal; also R. Pollock, of the same city; Daniel H. Shea, Burnley, a like prize for a nice design and arrangement of thistles and roses—the colouring too purple; Maggie Strang, Glasgow, for a bold curtain, with folial groundwork in colours. The entwined foliage and birds of a Glasgow student (293), the silk and gold tissue by C. Ripper (515), are other designs. The embroidered quilt (silver medal) by a Manchester student, executed on linen in silk and flax thread, outline worked in "couch" and rope stitched, is very effective. In designs for textiles we also note a window-blind in cut linen arranged in three compartments, by a Dublin student (105), another from the same school (99), for which bronzes are awarded. A very rich design for a side-board cloth, embroidered on cut linen (95), is sent by a Cork student, and wins the same distinction. A good damask pattern (18) wins a silver medal for a Canterbury student. All these are by ladies.

The designs for wrought-iron gates and metal-work are few. A bronze medal goes for an effective four-panelled gate with fan-light, and for an elegant pair of entrance gates the chief merit of which is that it is not overdone. We also notice a measured drawing of gates to choir at St. Ouen, which takes a silver medal. A silver medal is given for a jewel casket and candelabra in silver by a Birmingham student; there are weak points in the design, notwithstanding its general elegance. E. Preston, a Birmingham student, has the same prize for a very elegantly-designed hand mirror in silver. The figures of Truth and Falsehood round the border are very simply and gracefully drawn in ink outline, and the motive shows a thoroughly artistic and refined sense of the material. In another branch of design, pottery, we get a few works. A Sheffield lady student wins the silver medal for a design for plaque, in which medallions are introduced; well-drawn, and the colouring is harmonious, on blue ground. A clever and delicate treatment shown by a Poole student (400) for surface decoration. A Chester student, W. L. Hankey, wins a bronze medal for a design for hall seat, the details of which are well designed and drawn.

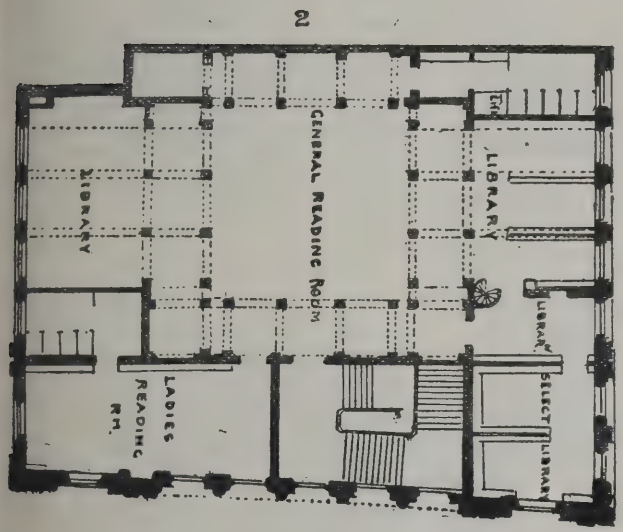
Designs for decoration include a clever treatment of the end of swimming-bath, Pompeian in style, by Herbert Cole, Manchester, who takes a silver medal. The colouring in shades of green and chocolate is harmonious. No. 371 is in the same style. Another Manchester student, W. H. Cantrill, has silver medal for a design for the decoration of a staircase and proscenium. The motive of open verandah is not quite appropriate; but there is much refined taste in design and colour evident. The drawing-room decoration (372) is unsatisfactory, and the dining-room treatment (332) poor in proportion and heavy, especially the frieze and doorway. A silver medal is given for a design of a stained-glass window, the subject being the "Burial of Moses," by a Birmingham student, a conception of much power and ability.

Our limits prevent our reference to the monochrome painting of ornaments, many of which are excellent, as the frieze No. 48 and No. 35; the designs for arabesques, the drawings from the antique, and the groups in oil and water-colour, foremost among the latter being students of Aberdeen, Edinburgh, Blackheath, Lincoln, Nottingham, and Norwich, and Hanley.

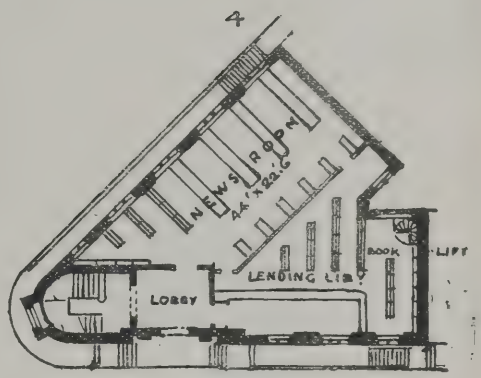
The modelling works are especially meritorious, David M'Gill, of the Art Training School, taking two gold medals for a circular panel relief or medallion, 454, and two delicate reliefs for a medal, admirable in the grace of the figures.



FREE PUBLIC LIBRARIES.—III.



WHAT are the essentials of a building intended to serve the purpose of a free public library? Hitherto we have given a few examples of buildings that have been erected in the provinces and in London for the objects sought to be promoted by the Public Libraries Acts. They are some contribution to the solution, but it is more than problematical whether many of them have fully answered the objects. A small congested entrance, a public lobby space inadequate to meet the demands of the public who go to borrow books, difficult access to the cases in galleries, and sometimes very defective light and ventilation are a few of the mistakes which one sees in visiting these buildings. We will now briefly point to some of the essential principles of library design. First, as to entrance and access. In some new buildings the tendency has been to cramp these and to reduce the width of the entrance to that of a private house. A great mistake. The larger it is in reason the better. The entrance hall should bear some proportion to the number of books to be lent out, or to the probable demand made by borrowers in the district. The number of readers in a given area may be approximately ascertained before the plan of a public library is prepared. We enter such an institution to find the entrance hall crowded with persons waiting to borrow or return books, others blocking the way by gossiping, or mere idlers, many of whom infest the free library with the object of killing time or lounging about. As a refuge for the mere idler, the free public library is open to abuse, and is one of the things that authorities will have to consider. But the crowd which fills the entrance halls of many of the Metropolitan libraries at certain times is one of the impediments to a public lending library. There should be some arrangement by which the borrower or visitor can enter at one door and leave at another to prevent confusion. At any rate, the hall or borrowers' lobby should be roomy. In large public buildings there ought to be one entrance and exit for borrowers who come and go, and another for those who use the news-room, reading-room, or reference library. Mr. Mountford, in a paper on the subject, suggested that there should be an outer porch, wherein copies of daily papers might be posted for the benefit of those who, being out of employment, want to see the advertisements early, before the library doors open: an excellent idea for large libraries in popular places. Our idea of a properly planned entrance and borrowers' lobby or public space is that it should be central between the news and reading rooms, that the lending library should immediately adjoin it, and have the book shelves in convenient proximity. The librarian and his attendants should command this space, or be near it. A side position is undesirable for an entrance to a large library, as there can be less supervision exercised. The public space for borrowers should be at the side, or be a prolongation of the hall, either open or separated by glazed screens, and should be of the whole width of hall or larger. One good arrangement is to inclose the space by a counter projecting into the lending library, which may be in a line with the entrance. Thus entrance-hall, space for borrowers, and lending library may be arranged on a central axis; on each side of the hall being arranged the news and magazine rooms, ladies' reading-room, and librarian's office. This distribution would give a general plan of a ⊥-shaped kind, with the cross piece downwards facing the street. The selected design for the Bermondsey Free Library is of this description. (See our remarks last week on the designs.) The whole width of the lending library may be given to the hall and borrowers' lobby on the principle we have named.



Easy supervision is next to be considered. This desideratum can only be fulfilled by grouping the apartments round the hall, and in placing the librarian's office in a central position so as to command the rooms on the ground floor. Circumstances will vary the position assigned to the librarian. He must have easy access to the departments, and should, if possible, be located next the hall, having a staircase to give access to the upper floor, and doors opening into lending library and news-room. The lending library should have communication by a staff stairs—often a spiral iron stair—to the reference library and store-rooms above. The attendants at the "issue" and "return" desks, which should be placed in connection with the counter surrounding the public or borrowers' space, should be able to see what is going on in the news and reading rooms, and with this object in view may be placed on opposite sides of the borrowers' lobby, glazed screens being erected, if necessary, round the lobby. Another of the requirements for easy supervision is the readiness with which books may be obtained, and the advantage of having cases not more than 6ft. 6in. high, so as to be within reach of female attendants, is obvious. The economical distribution of the cases or racks we will consider under another head, and to reach books on shelves high up ladders and galleries are required. Intercommunication between the departments is an essential for public convenience, and really resolves itself into good planning. Passages and corridors should be avoided; indeed, the most convenient plan is one which allows a person to pass from one room into another by openings between them. Thus the news-rooms and reference library, if on one floor, may be made *en suite* to open into each other, as shown in the Clapham Library, Fig. 3. The lending library should be on the ground floor, and, as we have said, in immediate connection with the hall and public lobby. It is not a public room, but filled with cases of books, in parallel rows about 3ft. apart, so as to allow of passage-room between them. The student and ordinary visitor to a library will first enter the news and magazine room; he will afterwards saunter into the reference room, where he will probably sit down to peruse a few books, and in passing from one into the other room it is not desirable that he should traverse a passage or cross the public lobby, which is generally taken up by the class of readers of fiction, chiefly ladies, who seldom enter the other departments, and who are in a state of constant migration to and fro. The news-rooms, being the most frequented, should be spacious, and have two doors, but placed so as to prevent a thoroughfare. The exit door should be within sight of the staff.

Accommodation is an essential point of plan. The architect has to consider two sorts of accommodation, one of books the other of the public. We have already noticed the value of a spacious entrance hall and lobby for borrowers. A great deal depends on the system of shelving and stacking the books. Three plans are in vogue.

One is the "alcove" or bay system, in which the cases are made to project at right angles from the walls between the windows forming bays or alcoves; another consists in placing the racks flat against the walls, and a third plan is in placing the racks in parallel rows across the room about 2½ft. to 3ft. apart. Whichever plan be adopted is of the first importance to the architect in planning his rooms, so that he may distribute his window openings and doors accordingly, and decide upon a width and length of room for the racks. On page 897 in our last volume we have shown these several arrangements. Plan 3 shows the alcove system as adopted at Edinburgh, plans 1, 4, 5, and 6 the other two arrangements. The plan of the Belfast Public Library, Fig. 2, which we now give, also illustrates the bay system, which has been carried out at Wigan and other libraries very successfully. There are some decided advantages in the alcove plan; it economises space, it allows for classification into departments of literature, it gives more light on the racks, and it enables readers to occupy the quiet of a recess undisturbed by the other visitors. Architecturally the bays facilitate the division of the room by columns, and thus aid the effect. Taking, as an example, a rack 5ft. long and 7ft. high, and allowing 10 books to every square foot, we shall get $7 \times 5 = 35 \times 10 = 350$ books, and supposing the room to have 10 such racks placed at right angles to the walls, there will be accommodation on this plan for 3,500 books. The centre of the room can be used for reading. As to the treatment of side walls, every case must be decided by circumstances and the need of light. Sometimes it is desirable that the lower part of the walls should be entirely given up to book room, and that the windows in the walls be placed as high up as possible, so as to allow flat racks or bookcases of 5ft. or 6ft. high to be placed below them. In the lending and reference libraries, standard bookcases 7ft. or 8ft. in height, exclusive of plinth and cornice, and 18in. in depth, with shelves on both sides, should be provided; the shelves ought not to be longer than 3ft. 6in. and be movable. For higher cases a gallery is necessary. For this height ten shelves can be obtained for octavos and 12mo. books; but for larger books, folios and quartos, there would be about eight shelves. For wall cases a ledged base is required about 18in. deep and 3ft. high, the upper portion of case being 9in. deep. An allowance of ten volumes per lineal foot is calculated for a lending library case ten shelves high; reference books are estimated at nine volumes per lineal foot. Details of libraries have been given in Mr. Greenwood's useful work on Public Libraries, a new edition of which has been lately published.

The public accommodation is so directly connected with the book provision and the manner the cases are arranged, that the architect may devote his principal attention to the latter. A small public library to accommodate, say, 10,000 books should be planned, therefore, with distinct reference to the space occupied by the books.

We have endeavoured to give a few typical arrangements of economical plans. Those we now illustrate are good examples of buildings erected under limitations of space. Plan 1 is the ground plan of the Darlington Library. The entrance and public space are skilfully aligned, and in direct connection with the lending department and other rooms. The library has a gross number of 14,390 books, and the average number of visitors to the reading-rooms daily is 950. The dimensions are as follows: Lending library, 57ft. by 29ft., lighted from roof; reference library, 36ft. by 29ft., with north light and top light, having two glazed bookcases 16ft. long, each capable of holding 3,000 vols., two reading tables 14ft. long by 3ft. 9in. wide; general reading-room, 51ft. by 29ft. By glass-panelled doors in the lending room the librarian, whose desk is in front of the centre, can see every person who enters the lobby, reading-room, and reference-room. The indicators, which run from the desk, give record of 2,400 volumes. The bookcases contain 32,000 volumes. Cost of building was £8,000, and the architect was Mr. G. G. Hoskins, F.R.I.B.A. The Belfast School, designed by W. H. Lynn, R.H.A., Fig. 2, represents a plan in which the rectangular area is cleverly arranged with a central reading-room, with the libraries opening out of it. The architectural effect is good, and the lighting well managed. Plan 3—the ground floor of Clapham Library—shows a satisfactory *en suite* arrangement of news-rooms and reference library, designed by Mr. E. B. I'Anson, the cost £3,865. The news-room is the largest, and is 57ft. by 27ft., and will hold 150 persons. The issuing room or lending library has space for 27,000 volumes, and is lighted by three lanterns. It has wall and centre cases. From the borrowers' lobby two large swing doors open into the news-room; a large room upstairs, 45ft. by 24ft., can be

used as a lecture-room. Plan 4 represents the Clerkenwell Library, ground floor. The news-room is 44ft. by 22ft. 6in.; the lending library 25ft. 6in. long and of triangular shape; a good counter and lobby is accessible from the entrance, and there is a book lift and stairs. The upper floor contains a large reading-room 52ft. by 22ft., with transverse cases, and a reference library 24ft. by 22ft. The plan is a clever adaptation of a triangular or corner site, the staircase occupying the corner.

The increase in these valuable institutions during the past few years has been remarkable. There are now 209 public libraries in the United Kingdom, of which no fewer than 76 have been provided during the last four years, and the number promises to steadily grow as the educational and recreative value of such establishments becomes more fully appreciated. The latest addition to the metropolitan parishes which have adopted the Acts is St. Mary, Newington; but in several other cases the adverse vote of previous polls of former years will probably be reversed next time the ratepayers consider the question. Architects will do well, therefore, to study the question more thoroughly, for in several recent competitions we noticed designs exhibited showing a ludicrous failure to grasp the elements of the problems set.

LANDSCAPE GARDENING.*

VERY few recent attempts have been made to treat the principles of the art of landscape gardening as an important accompaniment to architecture. The architect has, in fact, very seldom the opportunity of devising a scheme of laying-out grounds in connection with his buildings. Often the work of the landscape gardener has been done before he is called upon to design his edifice; frequently Nature has already accomplished all that is required, or is left without interference, and what is done by art to improve the surroundings of the site is handed over to the estate gardener or steward, who often, through ignorance, spoils the site and grounds by the ruthless removal of trees, and by general levelling operations, which completely destroy the character of the landscape, by ignoring the connection which should subsist between the park and the surrounding scenery. Few architects are prepared, either by education or natural aptitude as artists, to undertake the arrangement and formation of grounds, and therefore any hints and suggestions on the subject of landscape formation are of value. Mr. Henry Ernest Milner, F.L.S., Assoc.M.Inst C.E., has contributed his experience and artistic conceptions on the subject in the form of a handsome folio volume on "The Art and Practice of Landscape Gardening," illustrated by plans and etchings. The work is practical and suggestive. Many of those still living can remember the time when the house and garden were planned with the most rigid formality, the endeavour being made to produce an air of artificiality, by reproducing Italian and French features, and to separate, as it were, the gentleman's estate from the surrounding landscape as much as possible. Many of our old parks and estates still preserve this appearance. Mr. Milner follows in the wake of Nature: his taste is essentially for the English or picturesque method of formation, and in this respect he develops the principles established by Repton in his able and interesting work on landscape gardening.

The age of pictorial effect followed as a reaction that of the Italian or Classic landscape style. Mr. Milner enumerates some of the elements of the beautiful in landscape. Water, varieties of curvature, undulation of surface, contrast, gradation of light and shade, direction of lines, masses of foliage, outline grouping, effects of distance, openings in trees, all lend their aid, and become valuable agencies in the hands of the artist.

Some useful hints are given on the "approach," the first feature to decide upon in designing a park, which may even in some cases determine the site of the residence. Many estates have been ruined by a bad and ill-devised carriage approach. The great principles to bear in mind is that the road should appear to be a naturally direct approach; that while straightness is to be avoided, the curvature or deviation should result from the undulation of the ground, from some obstacle like a clump of trees. A curved road commands variety of views, and is generally of easier formation on account of the levels. The straight approach is admissible only for grounds which are flat, and when the building to be led up to is of a palatial or Classic character. We can, for example, admire the stately avenue leading to Hampton Court Place. The author recommends 11ft. or 12ft. in width for one carriage, and 16ft. to 18ft. for a double drive, a sharp curve requiring a greater width. The main drive should rise gradually to the house, or at least when the house comes in view; the impressions obtained from it at different points should increase in interest at every turn. Several sketches of treatment are given which indicate how advantage may be taken of the line or direction of the public road to form the entrance-gates. A lodge should be placed to command a length both of the drive and public road, and the entrance is better placed at the foot of a hill, and not on the rise or at the top. Speaking of the site of the house, as regards the aspect, the south-east is preferred for the main front in the Southern and Midland counties of England; in the Northern counties a more southern aspect is recommended, so as to gain full advantage of the shorter period of sunshine. Our author says: "It is not desirable that the aspect of a residence should be sacrificed to secure prospect." A fine view may be taken better from a position in the garden than from the windows. It is an advantage to create new points of interest. Some useful remarks are given about boundaries, which should not be too formal, but allow the eye to travel between groups of trees, so as to give the idea of distance and space; the necessity of obscuring by plantations unpleasant objects. A southern hillside is a good situation for a house. Referring to shelter, the author says planting may be employed on north-eastern, northern, and north-western sides, and on southern coasts on the south-western side. Much, of course, must be left to circumstances, and a compromise between aspect, prospect, and shelter made. Good prospects to the south-east and south-west being obtained, the main entrance may be on the north-western side, the offices on the north-eastern, and the garden toward the south-east.

The value of the terrace as a base to a building cannot be over-estimated; it is, in fact, an artificial arrangement or setting, which serves to separate the rural and picturesque portions of the grounds from the building. The straight lines of slope, balustrade walks, and beds harmonise with the architectural design, and the more important the building the more artificial and pretentious should be the terrace, the greater its breadth and length as a base. The parterres should be formal, geometrically arranged, and the style of architecture should dictate that of the terrace. A few plans and details of terrace arrangements are shown; beds for flowers, statuary, foliage plants, clipped yew, and box are necessary accompaniments to the terrace-garden. Terrace walls, flights of steps, and balustrades are considered, and some useful dimensions are given as to height and thickness of walls. An etching is given of the terrace arrangement to Friar Park, Henley, a residence in a Late Gothic style, designed by Messrs. Satchell and Edwards, architects.

The author's remarks on arrangement and formation are to the point. The plan of a garden must be controlled by such conditions as contour, natural levels, soil, the display of surrounding features. Any attempt to arrange a garden or a park upon paper without studying the site must end in failure. Various positions and views have to be considered and dealt with; the factor of growth of trees must be taken into account. Many things have to be avoided, such as straight lines, meaningless walks, sameness of groups of planting, uniformity of curvature and outline of trees. From the terrace outwards nature should be simulated; on the other hand, as the house is approached the planting and work should become more artificial and more intricate. Suggestive observations are given by the author about planting groups as screens for the purpose of shelter, or to shut out observation, and the value of arranging the outline on plan so that its form cannot be followed by the eye; it is this resource of the artist, the charm of expectancy rather than revealing all at once, which adds to the natural beauty of the landscape garden, and gives apparent spaciousness. Variety in outline, as well as in plan of groups, is an important point. Mr. Milner illustrates how curved walks and groups of planting should be arranged, and the levels formed to produce variety and prospect. We have no space at our disposal to treat of the practical part of the work on Formation and Planting, which latter contains useful lists of trees and shrubs suitable for different positions and soils. The important feature of Water is discussed in another chapter. Fountains, structures such as seats, pavilions, and bridges, hothouses, and other accessories, are also dwelt on. Public parks and cemeteries are illustrated by plans of the Buxton Public Gardens and Stoke Cemetery. A building estate forms another example. In the examples of work an etching is given of a view of the grounds and palace at Keszthely in Hungary, the former laid out by the author, and the latter from a design of Herr V. Rumpelmeyer. The arrangement of the gardens is shown by a plan. A more suggestive example of laying out a garden or park is that of Peverey, near Shrewsbury, for Sir Offley Wakeman, Bart., though the work is yet incomplete. The river Perry runs, though, in a north-east to south-east direction, the ground falling on both sides towards it. The land converted was agricultural, and consisted of several fields. Of the house and terraces, designed by Mr. Aston Webb, in a Late Gothic style, we gave a view on May 16th. The house occupies an elevated part of the beautiful grounds, and its site was determined by the architect and Mr. Milner, the latter of whom laid out the park and gardens.

* The Art and Practice of Landscape Gardening. By Henry Ernest Milner, F.L.S., Assoc.M.Inst.C.E. London: Of the author, Dulwich Wood, Norwood, S.E.

SHADOWS—IV.

WE now come to the system of shadows for curved surfaces. The principle remains the same, that of finding the intersection of the planes of the shadows with the horizontal or vertical planes.

In Fig. 12 we have a semicircular doorway flanked by two buttresses. The shadows thrown on the wall by these projections are easily found by means of the plan, as at A A, *a a*, B B, *b b*, S S, &c. The plane of the shadows of S S intersects the moulding C H on plan at *c*, and in elevation at C; the plane of intersection being at 45°, the shadow at C will take the form of the moulding reversed. The shadow of H *h* meets the wall plane of the doorway at *h* H.

We have now to find the shadows thrown by the soffits of the inner and outer arches of the doorway. The centre from which these two arches are drawn is at D in elevation and *d* in plan. We have remarked above that the shadow of a point is equal in distance, vertically and horizontally, to the projection of this point from the plane which receives the shadow. The shadow of an arch, being itself the shadow of an infinite number of points taken on the circumference of the arch, and the shadow of these various points being distant from these same points in proportion to their projection from the wall-plane, the curve contained in these shadow points will be equal or proportional to the circumference itself, and therefore have the same radius as the circumference which casts the shadow. The centre, therefore, with which to describe the curve of the shadow, will be the shadow of the point serving as centre for the arch. We must find the shadow of the point D *d* at E *e*. Then if with the point E and the same radius as for the outer arch we draw a semicircle, we will find that the circumference will pass by the shadows of the various points taken on the circumference of the outer arch; this circumference will therefore be the shadow of the arch. In the same manner, for the inner arch, the projection of the centre D *d* gives us the shadow F *f*; this point F is the centre from which to draw the shadow of the inner arch.

Thus, to obtain the shadow thrown by the soffit of an arch, drawn with any point as centre, we have to find the supposed shadow of this point on the plane from which the arch projects, and with the point obtained as centre and the original radius describe the curve of the shadow.

At Fig. 14 we have a detail of the shadow thrown by the projecting portion of the string mouldings. The shadow of the point A of the moulding falls in this case on the wall plane

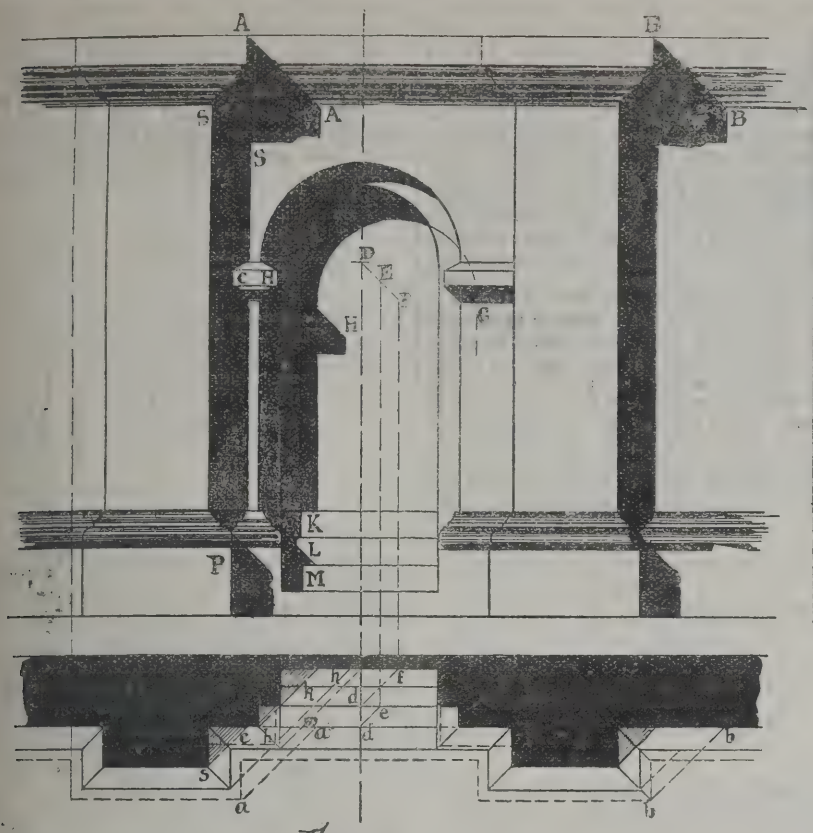


Fig 12.

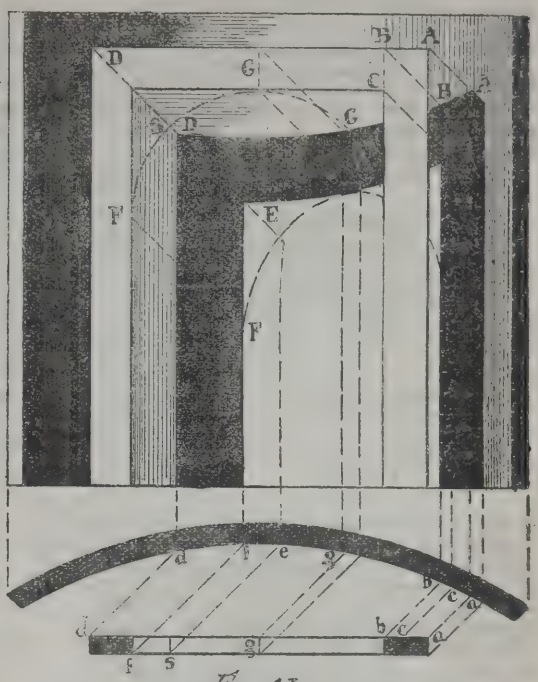

Fig 13.

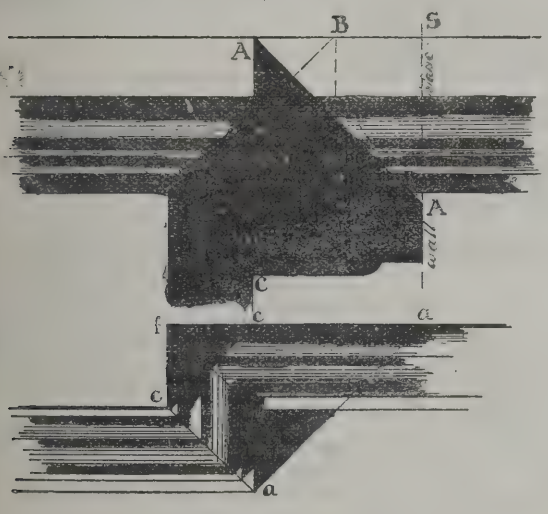

Fig 14.

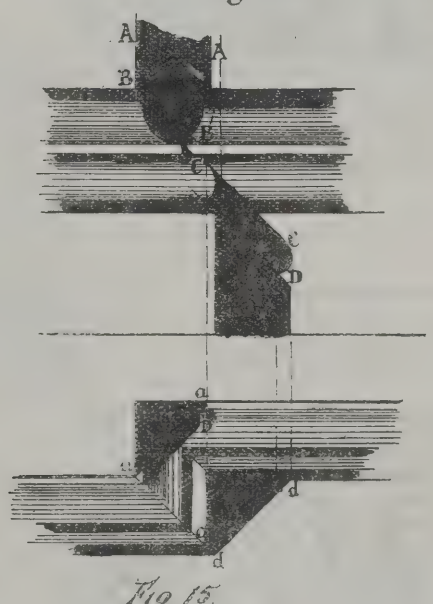

Fig 15.

below the string-course at A, which point is given us by *a* in the plan. It was, however, possible that the shadow of the point A may have been stopped by one of the component mouldings of the string before it reached the wall-plane. Let us suppose such a case, and that the moulding is not continued beyond the points A C, and that we have only the plane wall surface A S, against which the shadow of A is cast. A A is the shadow line at 45° from the point A. Let us now continue the string mouldings beyond A C, and trace the section of the moulding A B projecting from the wall plane A S. If the shadow line A A meets the section of the moulding at any point, we know that at this point the shadow from A would have been stopped by the moulding, and so not have reached the point A on the wall-plane. In Fig. 14, however, the shadow line A A is not stopped by the section of the mouldings, and therefore proceeds to the wall at A. The line B C is at 45°, and similar to A A. A B is also necessarily equal to the amount of the projection of the return of the moulding *c f* on plan. Thus, in similar cases, we have to mark off from point A, a distance equal to *c f* on plan, as at B, and from the point B draw a line B C at 45°. If the line reaches the wall plane without touching the section of the moulding, the shadow of this point, or the corresponding point A, will be on the wall plane. If, however, the line at 45° touches the moulding at any point, at this point the shadow is stopped, and the remainder of the shadow of the moulding follows a different form.

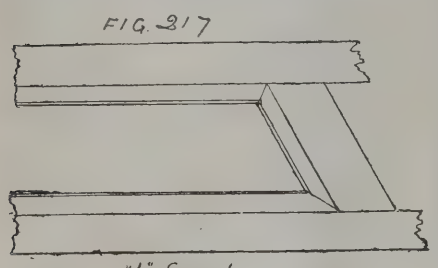
Fig. 15 is a detail of the shadow thrown by the moulding of the plinth. The plane of the shadow A B meets the wall-plane at A, and also cuts the congé of the moulding at 45°, forming the shadow B. The shadow of the point B would reach the wall-plane at M, but is interrupted by the congé and stopped at B. The remaining shadow at C D is easily found by means of the points of the plan *c d*.

It would be good practice for the student to draw to a large scale a series of different forms of mouldings, and find the shadow thrown by the projecting portions on the rest of the moulding, first obtaining the shadow points as thrown against the wall-plane, and then the points where the plane of the shadow cuts the section of the moulding, thus obtaining the true shadows. A little practice, and he will find no difficulty in drawing these shadows.

We now come to the system of shadows thrown by projecting bodies on concave or convex surfaces. In Fig. 13 we will suppose the projecting body to be an entablature supported by columns, and represented in the figure simply by F O B, &c. From the points on the plan *d g b c a*, &c., we draw the lines at 45°, meeting the concave surface at *d g b c a*; the intersection of the projection of these points, with the shadow lines from the corresponding points in the elevation, will give us the shadow of these various points; then by drawing the curves contained by these points we obtain the shadow of the whole body. The shadow of the semicircle F S G is found in the same manner. This Fig. demonstrates what we have remarked above—viz., that the shadow of a point descends to a distance equal to the distance of the point causing the shadow from the plane receiving the same.

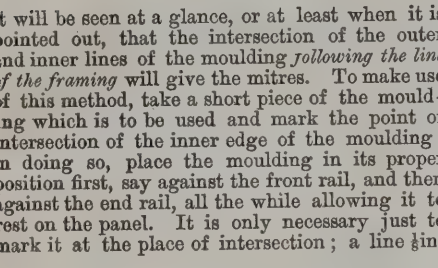
Arthur Vye Parminter.
Palais des Beaux Arts, Lille.

CARPENTRY AND JOINERY.—XXXII.



Window Finishing.—(*Continued.*)

In the preceding article, a general outline was given of what pertains to a "full-trimmed window;" however, some of the details were not



entered into, so before entering upon other varieties, it will be better to attend to these.

The soffit has a *tongue* allowed for and worked on the inner rail, which enters into a plough groove in the top inner casing of the sash-frame. This will be seen to be very serviceable, for obvious reasons. The moulding of the acute and obtuse angles of the soffit may present a little difficulty to some.

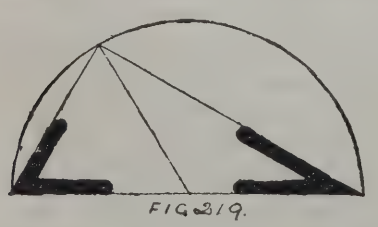


Fig. 217 shows the two angles referred to, and

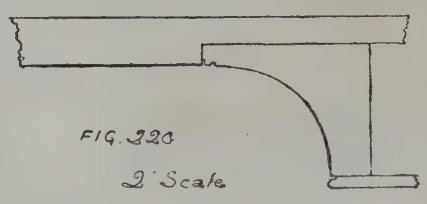
it will be seen at a glance, or at least when it is pointed out, that the intersection of the outer and inner lines of the moulding *following the line of the framing* will give the mitres. To make use of this method, take a short piece of the moulding which is to be used and mark the point of intersection of the inner edge of the moulding; in doing so, place the moulding in its proper position first, say against the front rail, and then against the end rail, all the while allowing it to rest on the panel. It is only necessary just to mark it at the place of intersection; a line ⅛in.



long in each case will suffice. The moulding may be cut to the *rake* by marking it when laid near to its position. In the cases wherein one end of the piece of moulding has ordinary mitre, make the centre or obtuse angle intersection first, as it is much easier taking the length and mitring the other end afterwards. The end piece should be fitted first, and the obtuse angle first of this end-piece of moulding, as it is much easier fitting the acute angle. In cutting with the saw (which should be a fine one) allow the moulding to be a little long, and with a *mitre plane* fit the respective ends of the moulding to suit the angle before putting in at all. This trial is best made by laying the two pieces of moulding upon the top of the rails, bringing

them near to the edges of the rails and at the angle they are intended to be placed in.

Fig. 218 shows the framing of one end of the soffit without any moulding, and also gives two pieces of moulding placed so as to test whether the intersection is a good one or not. This is a somewhat roundabout method, although pretty generally practised, and it is as well to know it; by it no knowledge of any lines or principle involved is necessary. The correct method is very simple.

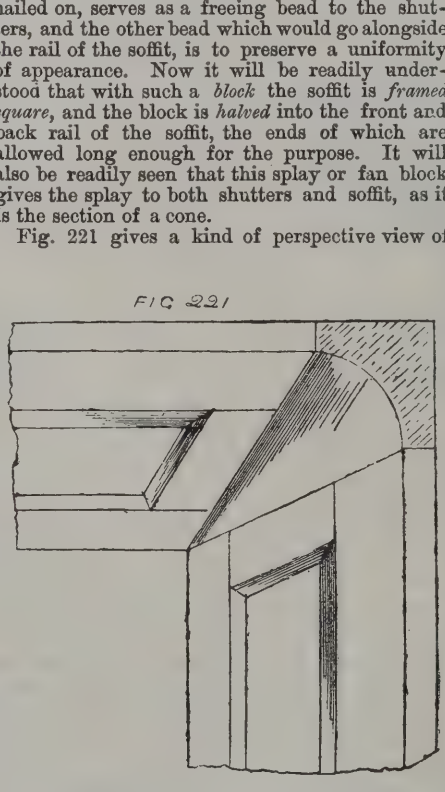


Fig. 219 shows how the lines are obtained. Having the line shown as horizontal in the figure, draw a line forming a similar angle with the horizontal line that the end rail of the soffit does with the front rail, let the point of meeting of the inclined and horizontal lines be the centre of a semicircle, which describe as shown, join the extremities of the diameter with the point at which the inclined line meets the circumference, and you have the bevels to cut the ends of the mouldings to, so as that they will intersect perfectly in the acute and obtuse angles. This method suits for all such angular framing when the angles are formed by the meeting of straight lines. When it is the case of a curved line meeting a straight one, the mitre or intersection of the two mouldings will be *curved*, not straight. When there are a number of soffits to mould having the same inclination in the end rails, it is best to make a *cutting block*, putting in a right and left-hand cut of each kind (bevel) to guide the saw, and the time will be saved, as, if the cuts are made accurately with a fine saw, one shaving off with a *mitre plane* will suffice; or, in most cases, if the cutting is done with a *dovetail saw*, it will do without any planing. In former times, say a generation or more ago, when the soffits of window finishings were elevated (splayed), a somewhat simple method was

adopted to get over the difficulty of the corner or angle, viz., by the insertion of a *fan block*.

Fig. 220 shows a front elevation of the outer end (that nearest the spectator in the room) of such a fan block. The lower bead, which is shown nailed on, serves as a freeing bead to the shutters, and the other bead which would go alongside the rail of the soffit, is to preserve a uniformity of appearance. Now it will be readily understood that with such a *block* the soffit is *framed square*, and the block is *halved* into the front and back rail of the soffit, the ends of which are allowed long enough for the purpose. It will also be readily seen that this splay or fan block gives the splay to both shutters and soffit, as it is the section of a cone.

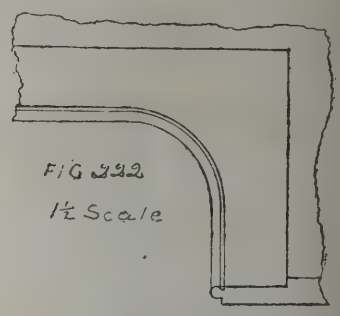

Fig. 221 gives a kind of perspective view of

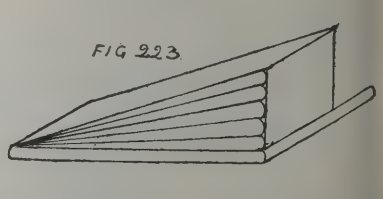
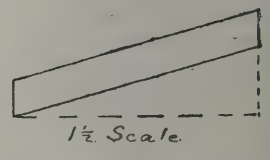


the fan block, and part of shutter and soffit, so as to give a pretty clear idea of the finished trimming. No architrave is shown in Fig. 221, to avoid complications. However, the architrave is often put on just as if the angle were square—that is, the top and side architraves intersect at right angles, showing part of the end of fan block. In other cases when the architrave is a *double-faced* one, the bead on its inner edge is carried round the quadrant of the block, and the first sunk face forms the right angle where the rebate or check forms the second face. (See Fig. 222.)

Of course, it is quite possible to have the architrave forming a quadrant corner throughout its full width, thus showing lines parallel with the fan block. But since the fan block has been almost completely set aside, other kinds of blocks have been introduced in order to serve the purpose.

Fig. 223 gives a view of a conical-reeded block which will suit, or *fluting* may be substituted for the reeding. When a block of this kind is used the soffit has to be framed with its outer cross rails splayed, and so that the block when fastened to the soffit, the rail will show a suitable margin that is equal at least to the top rail of shutter



Instructions were given in the 29th article of this series as to how the bevel on the top edge of this splay block may be obtained; but in that article it was jamb-linings which were being treated of, but the thing required is the same. However, a very simple arrangement for getting the bevel on the top edge of this splay block is having the working lines of the window-finishing *laid down* upon a panel; whatever splay or bevel the shutter have, if the soffit is to have the same, get out two wedge-shaped pieces having their butt ends of breadth equal to the splay of the soffit, plus, say ¼in. for sinking or housing into the soffit, and a point end equal to the depth of this sinking; then lay these, when planed, upon the panel and just over the *plan* of the front shutters, the

take a straight-edge and lay it on across the upper edges of these blocks, and it will be seen how much has to be planed off these top edges so as to suit the soffit. It will be found that it is always off the outer part of the top edges—that is, towards the back side, that the planing off has to be done, so that in getting out the blocks with square edges, first of all it does not require any extra amount to be left on.

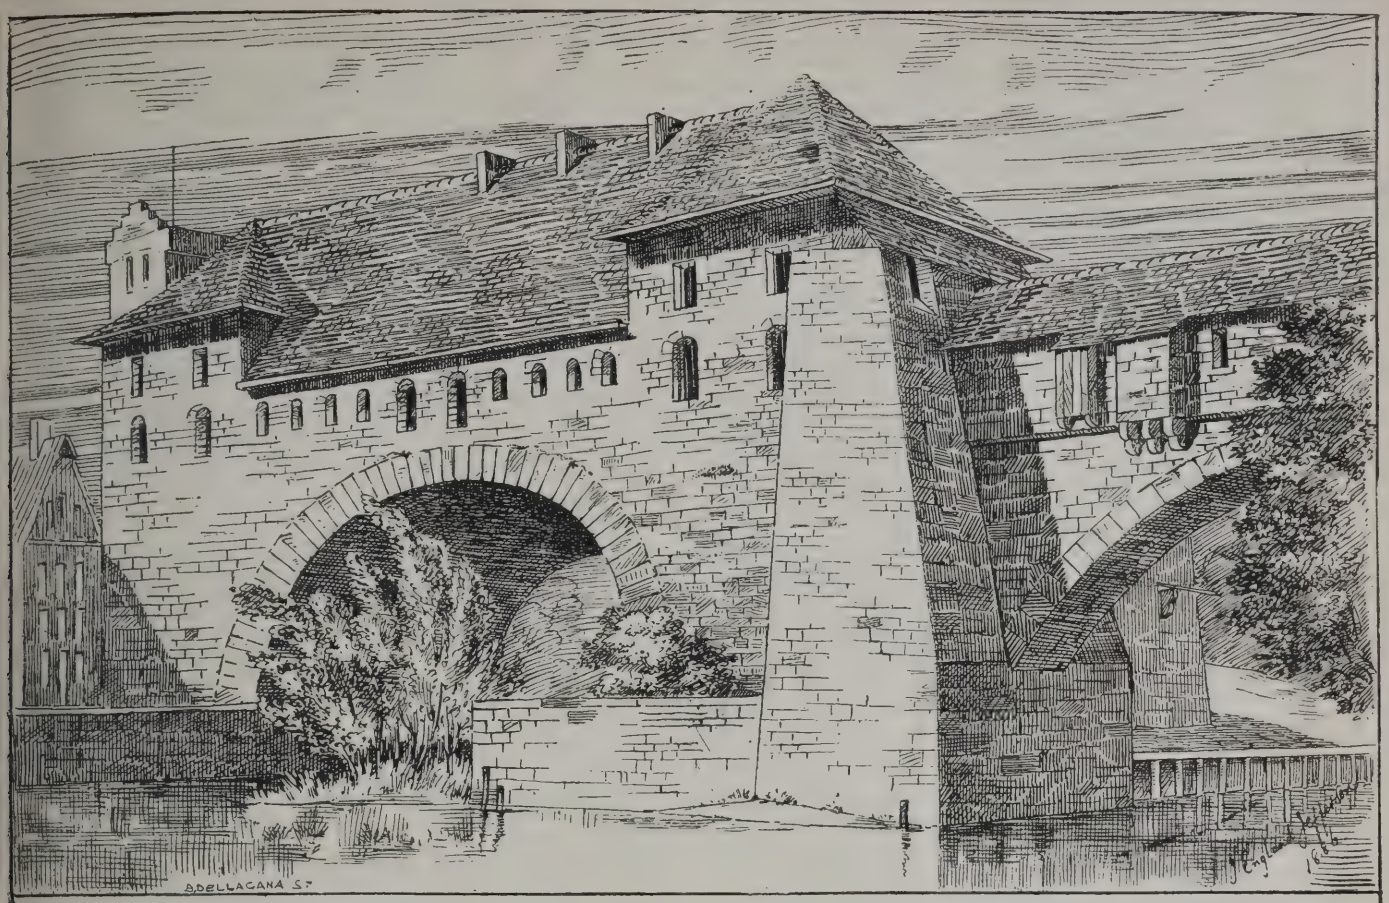


Fig. 224, which is almost unnecessary, shows the wedge-shaped block, and the under drawing of the figure shows the plan of this wedge-shaped piece; as it will be readily understood

that its ends will require to have the splay of the shutter, seeing that the plan of the shutter is in plan, and that, of course, is splayed.

SUPERFICIAL v. CUBIC CAPACITY AS STANDARDS FOR SMALL HOUSES.

At the annual congress of the Sanitary Association of Scotland, held at Perth on Thursday in last week, under the presidency of Dr. Cameron, M.P., a paper was read by Mr. John Honeyman, F.R.I.B.A., of Glasgow, on the "Substitution of a standard of superficial area for one of cubic capacity in small houses." The author explained that hitherto there has

KETTERN STEG PART OF CITY WALLS OF NURNBERG
AT THE EFFLUX OF THE RIVER PEGNITZ

been only one way of securing space for the occupants of houses—viz., by prescribing a certain number of cubic feet for each; and he desired to suggest another, which was in many respects preferable—viz., to prescribe a certain number of superficial feet of floor area. The object of such specific rules was, of course, to prevent overcrowding—probably the worst of sanitary evils. It was not seriously contended by anyone that 300 or even 500 cubic feet was enough for an adult for, say, the working man's eight hours' sleep; yet cases had been recorded in Glasgow where each adult had only 86 cubic feet. Overcrowding was a nuisance which must be put down summarily by some rule of easy application, and that legal definition of space was merely an instrument to that end. The chief merit of the rule he had suggested, as distinguished from the existing rule, was that it allowed more freedom of action to those who had to turn expensive sites to account in providing dwellings for the poor. It would also give them more freedom in dealing with existing property. Within moderate limits they could give the poor superficial area easier than cubic capacity, and therefore by following that course they made it easier to get a supply of houses for them, which meant that rents would be easier, even when sufficient inducement remained for builders to invest money in such property. In this regard he did not approve of the Police Bill at present before Parliament, in so far as it would prohibit civic authorities from converting certain large buildings into dwellings for the poor. The sanitary results of his proposed rule would be even more important than the economic. So far as the administration of the law was concerned, the change of standard would make no difference. It would be as easy for sanitary officials to apply the one as the other. The area would be a shade more easily got than the capacity. The position of the occupants of houses affected by the rule would be improved. Their houses would be cheaper, they would be larger, and more comfortable, and they would be more easily ventilated. These things had a direct bearing on health. For the purpose of illustration and comparison, he took a tenement having on each floor three houses of one apartment and one of two apartments. If the single apartments were to accommodate three adults with 400c.ft. each, they would require to be 10ft. high and to measure 12ft. by 10ft., and the frontage of the tenement would be 35ft. and the depth 32ft., and the site would extend to, say, 240 yards. Taking that as it stood, it was evident that if they were content with an area of 40ft. super. per adult, these houses would pass for three occupants either by the one standard or the other. But the difference was that whereas by the new Glasgow standard of 400c.ft. the tenement must have 10ft. ceilings, by the other the ceilings might be less. Suppose they were only 8ft. high, the rooms would still have the cubic capacity which up till last week was generally considered enough as a minimum—namely, 300ft. Now, he need hardly point out that if they reduced the ceilings to 8ft., and so took off the total height of the tenement, they would considerably reduce its cost. They could either do that or, maintaining the height, secure an additional story, still reducing the cost per house, and accommodating a larger population on the same area. The height of ceiling suggested (8ft.) was quite sufficient for all practical purposes. But he was not sure that the area of 40ft. per adult was sufficient. They might venture to fix the minimum at 45ft. without throwing any additional burden upon the poor householder.

The cost of a four-story tenement would be about £1,200, including ground at £1 per yard; and the cost of a five-story tenement would be £1,300, including other twelve yards of ground at £1. Taking the rents at a low figure, say £5 10s. for the single apartments, and £7 10s. for the two-room houses, the rental of the four-story tenement would be £96, or a gross return of 8 per cent.; while the rental of the five-story tenement would be £120, or a gross return of 9¼ per cent. These houses would have a cubic capacity of 360ft., and they would be large and more comfortable and more healthy.

A short discussion took place upon Mr. Honeyman's paper, in which it was pointed out by Dr. M'Vail (Kilmarnock) that the principle advocated was already applied to dairies and cowsheds in some quarters.

KETTERN STEG.

THE sketch of the above, which we herewith illustrate, is a portion of the walls by which the ancient town of Nuremberg is surrounded. The small river Pegnitz cuts the city in two, and during its progress through is crossed by some eight bridges. The subject of our illustration is that part of the town walls which bridges the river at its efflux. Nuremberg, or Nürnberg as the Germans call it, was once the centre of art and trade, and the most important town in Germany. During the 18th century it sank into comparative insignificance, and though perhaps it will never regain its position of greatness, yet it has risen commercially very much of recent years, and is well known for its manufactures of children's toys and lead pencils. Innovations are steadily making way, yet Nuremberg maintains its ancient aspect probably more than any other town of like importance, and with its antique towers, rambling streets, and quaint gables, is picturesque in a high degree.

A collection of drawings and designs, 500 in number, by the late Thomas Stothard, R.A., recently presented to the nation by Mr. Felix Joseph, has just been removed from the South London Art Gallery to the Nottingham Castle Museum, which is its final destination. These pictures are in course of arrangement in a special gallery at the museum, to be called the "Felix Joseph Gallery," together with some 600 other drawings by celebrated deceased Royal Academicians and others, likewise presented by Mr. Joseph.

Mr. E. Long, R.A., and Mr. T. Woolner, R.A., have awarded the scholarship in art of the Crystal Palace School of Art, Science, and Literature to Miss Edith Struben, a student from South Africa. At the exhibition of students' work on Saturday these gentlemen also adjudged a silver medal to Miss A. M. Scrase and a certificate to Miss Struben for landscape and architectural painting. In the oil painting classes a silver medal was awarded to Lady Hume. Miss Diana White gained the silver medal for a head modelled from the life.

A residence for Mr. E. J. Jenkins will shortly be erected on the Tyn-y-Pwll Estate, Whitchurch, near Cardiff, from plans prepared by Mr. Charles C. Jones, architect, Cardiff.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 166.)

NEW LABORATORIES AND WARE-ROOMS, NEWCASTLE-UPON-TYNE.

These buildings are now in course of erection for Messrs. Brady and Martin, wholesale and manufacturing chemists, on land situated in Northumberland-road. They comprise in the main building shown in front a large cellar in the basement, on the next floor the extensive offices of the firm and clerks, and a show-room of the various products manufactured by the firm. The two floors above will be devoted to the ordinary routine work of wholesale druggists. At the back the chief building will comprise drug mills, and a large laboratory fitted with the most approved machinery and appliances for the manufacture of pharmaceutical preparations on a large scale. The various retail departments of Messrs. Brady and Martin will still be carried on at 27, 29, and 31, Mosley-street, where the firm occupy one of the most artistic buildings in the city. The walls of the new premises are of brickwork throughout, the front towards the street being faced with red pressed bricks from Ditchling in Sussex; the dressings to the front elevation are in Kenton stone, polished. The contractors for the building are Messrs. R. and J. Lowry, Newcastle. The designs are by Mr. Lister Newcombe, F.R.I.B.A., of Newcastle, and the total cost will be between £8,000 and £9,000.

SHEFFIELD MUNICIPAL BUILDINGS.

Last week we completed the illustration of the six perspectives and plans of the two principal floors of the selected final designs for these buildings, including the one which is to be carried out. We also gave the elevations of Mr. Tulloch's design, because of its merit in detail. To-day, for the same reason, we reproduce the main façade of Messrs. William Harvey and Smith's design facing Pinstone-street. The description of their design was printed with the perspective last week.

RUNKERRY, BUSHMILLS, CO. ANTRIM.

This house is the residence of the Right Hon. Lord Macnaghten. It commands extensive views of the North of Ireland Coast, and is within a short distance of the celebrated Giants' Causeway. The buildings were carried out by Messrs. James Henry and Sons, from designs by Mr. Samuel P. Close, F.R.I.A.I., Belfast, who prepared the drawing which we reproduce to-day. It was exhibited in a recent exhibition of the Royal Hibernian Academy at Dublin.

PLUSCARDYN PRIORY, ELGINSHIRE, N.B. (ROYAL INSTITUTE OF BRITISH ARCHITECTS' SILVER MEDAL DRAWINGS, 1890.)

In the Building News for April 4th this year we gave two double-page plates from this same series of prize drawings by Mr. Alexander Mackintosh, with his description of the buildings illustrated. To-day we complete the series by a further sheet of geometrical sections and a view.

LIME TREE-WALK, SEVENOAKS.

The street of cottages at Lime Tree-walk, Sevenoaks, of which we give an illustration to-day, were designed to remedy the growing want of houses for artisans and labourers caused by the high price of land in that neighbourhood and the restrictive covenants put upon all that was brought into the market for building purposes, which prohibited the erection of any house less than a villa. The consequence of this prohibition was that while many attractive cottages with garden plots were pulled down for the sake of their sites, none were built to replace them except on a crowded site at an inconvenient distance from the town, in a most unattractive position, where a poor quarter rapidly sprang up with all its attendant disadvantages. Fortunately it was possible to secure a field free from restrictive covenants close to the centre of the town, and commanding lovely views over Kippington Park and the Holmesdale valley. Here a road was formed, and 24 cottages were built, containing a kitchen, parlour, and, with two exceptions, three bedrooms apiece. Each has a small plot for flowers in front, and a small piece of ground at the back. They are built of concrete, with red brick dressings and red tiled roofs, and the dark-brown ironstones dug on the site have been used in the arches over the porches and in the columns under the outer gallery of two sets of cottages which occupy an upper floor. Near the entrance to the new street is a coffee-house, which goes by the name of the "Lime Tree," containing a large room, 40ft. by 20ft., suitable for public entertainments and private parties, a large bar and reading-room, and a considerable number of bedrooms for visitors. Attached to the coffee-house is a garden and stabling. It is well frequented in the spring and summer by pleasure parties and school excursions, as well as by regular customers. The ground was laid out and the buildings were designed by Mr. T. G. Jackson, M.A., architect, and the work was carried out by workmen employed under the direction of his clerk of works, Mr. E. Long.

The London County Council rejected on Tuesday the recommendations that they should undertake, as Metropolitan improvements, the widening of Knightsbridge, near Albert Gate, and of that part of the Albert Embankment formerly called High-street, Vauxhall, except on condition that the parishes of Kensington and Lambeth should contribute in each case one-fourth of the cost. The Camberwell Vestry propose the purchase of 48 acres of land near Peckham Rye, to be added to the common. The purchase money required was £50,925, and towards this £32,000 had been promised—£12,000 by the Charity Commissioners, and £20,000 from the Camberwell Vestry. It was decided that the Council should conditionally contribute the balance, not to exceed £18,000.

The new National Museum and Library Buildings in Kildare-street, Dublin, will be opened by the Lord Lieutenant of Ireland on the 29th inst. They have been built from the designs of Messrs. T. Newnham Deane and Son, of Dublin, who were successful in the final competition, and have been illustrated in our issues of Oct. 31, Nov. 14 and 28, 1884. The style is that of Sansovino's Library at Venice.

St. Cuthbert's Roman Catholic chapel at Gorgie, near Edinburgh, was opened on Sunday. The building, which will serve the double purpose of school and chapel, pending the erection of a church upon another part of the site, is of simple Gothic design. The sanctuary has been richly decorated internally in colours and gold. The building is seated for a congregation of 250, can accommodate 160 school-children, and has cost about £800. It, along with a presbytery on the same site, has been erected from the designs of Mr. J. B. Bennet, of Messrs. Buchanan and Bennet, 24, George-street, Edinburgh.

The First Commissioner of her Majesty's Works announces that in future the words "which must be verified by the persons desirous of tendering" will be omitted in the Board's advertisements for tenders for building works.

COMPETITIONS.

Bermondsey Free Library.—We have good reason to believe that the final award made by the committee in this competition was not in accordance with the report of the professional assessor, Mr. George Elkington, F.R.I.B.A., neither were the premiums conferred as he advised. The committee reserved the right of making their own selection, and, acting upon this clause, their ultimate choice was determined in favour of Mr. Johnson's plan. This decision has been this week ratified, and this design will be carried out, though thus far the consent of the Vestry for the erection of windows on the return front has not actually been obtained. The conditions of the competition provided that there should be no windows on this elevation.

Fleur le Lis, Wales.—Five architects sent in designs for a new church at Fleur de Lis to seat 300, at a cost of not more than £1,500, and the plan by Mr. E. A. Johnson, of Abergavenny, has been chosen by the Trustees of the Gelligaer Lectureship Endowment at their meeting last week.

CHIPS.

A contract for a mission church in connection with St. James's Church, Moss Side, Manchester, has been accepted by the committee, and the work commenced. The outlay will be about £500. Mr. Geo. Macfarlane is the contractor for the works, and the drawings have been prepared by Mr. John Lowe, architect, of Manchester, under whose superintendence the parish church was recently erected.

The Society of Antiquaries of London has struck a medal of Mr. Charles Roach Smith, in recognition of his life-long services to archæology. This is the first instance of such an honour being accorded to a fellow of the society, and a surplus of over 100 guineas accompanies the medal.

The Duke of Edinburgh, who was accompanied by the Duchess, presented the prizes at the Ryde School of Art on Monday.

The Amphitryon Club and Aouste's Restaurant are about to be housed in premises in Albemarle and Stafford streets, W., which are being rearranged by Messrs. J. W. Shillitoe and Son, of Bury-St.-Edmunds, from plans by Mr. John W. Rhodes, of Clifford's Inn. The decorations will be executed by M. Meilliers, of Margaret-street, W., under the architect's superintendence.

The second excursion of the archæological section of the Birmingham and Midland Institute took place on Friday in last week, when Melbourne Hall and Church, Derbyshire, and Ashby-de-la-Zouch Castle and Church were visited, Mr. J. Cotton acting as guide.

The alterations and enlargement of St. Margaret's National Schools, Whalley Range, Manchester, have been commenced, in accordance with plans, &c., approved by the Education Department, by Messrs. R. Neill and Sons, builders, of Manchester: cost about £1,100, under the superintendence of the architect, Mr. John Lowe, of Manchester.

A Select Committee of the House of Commons, presided over by Mr. Woodall, passed the Bill incorporating a company with powers to construct a circular "subway railway" around Glasgow. The total length of this line will be over six miles, and the share and loan capital authorised is £937,500. This scheme has now been sanctioned by both Houses.

A new Roman Catholic Church at Burnham, Somerset, adjoining a convent of French nuns, has just been opened. It has been built from designs by the Rev. A. J. C. Scholes, of Bridgwater.

Plans have been prepared by Messrs. L. and J. Falconer, architects, Blairgowrie, for the erection at Clayquhat, Bridge of Cally, Perthshire, of a new Free Church. The plans show a Gothic erection seated for 200, with vestry and heating chamber.

Two elaborate memorial windows have just been placed in Delph-hill Chapel, Bolton, illustrating the texts, "Suffer Little Children" and "Feed My Sheep." The work was painted in St. Peter's Studio, Manchester, by Mr. W. G. Sutherland.

A new Primitive Methodist church, with schools underneath, is in course of erection at Congleton, from the designs of Mr. A. Tomkinson, architect, of Tunstall. The building, with fittings, will cost about £200. Mr. John Worrall, of Congleton, is the contractor.

The contract for the erection of the lecture-hall and schools connected with Withington Congregational Church has been accepted, and the work begun by Messrs. Southern and Sons, contractors, of Salford, involving an outlay of about £2,000, under the superintendence of Mr. John Lowe, architect, of Manchester.

ALTERATIONS AND ADDITIONS TO COTTAGE AT HURLEY.

ORIGINALLY two cottages—one at back, and adjoining that shown in small sketch—this house is beautifully situated at Hurley-on-Thames, overlooking General Owen Williams's park, being used as a summer boating residence. The alterations shown were carried out last winter, when the interior was largely remodelled. There were three entrances, one being done away with and thrown, with the two front rooms, into one large dining-room, now 22ft. 6in. by 14ft., without the bays. A good entrance-hall was formed, and porch added. In addition, the accommodation consists of drawing-room, large lobby, and six bedrooms. The new stoves and wooden mantels have been supplied by Messrs. Barnard Bishop. The oak fences and gates were from Messrs. Taylor and Brooking, of Dorking, the general work being carried out in the best possible manner by Mr. Y. J. Lovell, of Great Marlow, from plans by Mr. Spencer W. Grant, A.R.I.B.A., of 63, Finsbury-pavement, E.C.

ARCHÆOLOGICAL.

Explorations at Strata Marcella.—The first week's excavations on the site of the Montgomeryshire Abbey of Strata Marcella have been very successful and satisfactory. Mr. Charles Jones, F.S.A., had consulted Mr. Stephen Williams, F.R.I.B.A., Rhayader, who has charge of the excavations at Strata Florida. The site of Strata Marcella was indicated by the fact that some land near the Abbey Bank at Pool Quay was tithe free. The abbey was built in the 12th century. The first impetus given to the proposal to explore the site was the finding amongst the material which formed the weir in the Severn not far away of a beautiful floriated carved stone, which had evidently been the capital of an Early English column. Foundations of several walls ave been found, including those of the choir of the monastic church. To the north of the chancel trenches have been dug, and have disclosed a flagged space extending for 24ft. north and 25ft. west. The flags are in a good state of preservation, and one of them is 6ft. square. At the north of this space a skull and nearly a complete skeleton were found, and a large number of bones have been exhumed. Other discoveries include fragments of window tracery, odd pieces of iron, lead, and pottery, and many chips of stained glass. Some of the pavement tiles are of the same pattern as some found at Strata Florida.

The parish church of Bromfield, near Ludlow, was reopened on Thursday, the 24th July, after restoration. The oak roofs have been repaired, the walls panelled, and the church reseated with open seats of oak. A brass eagle lectern has been placed in the chancel. Stained-glass windows have been presented by the Bishop of Melanesia and two other donors. At the entrance of the churchyard a lych-gate of oak has been erected by Mrs. Selwyn, the vicar's mother, in memory of her husband, George Augustus Selwyn, Bishop of New Zealand. The cost of the work, exclusive of the special gifts, has been nearly £3,500. The walls have been re-cast at a cost of a hundred guineas. The work has been carried out by Mr. J. Grosvenor, of Ludlow, from designs by Mr. C. Hodgson Fowler, F.S.A., of Durham.

At the last meeting of the Bath school board it was agreed to invite the whole of the Bath architects to send in competitive designs for the new girls' and infants' school, which it is proposed to erect in Lower Bristol-road.

At a meeting of persons interested in a scheme for providing dwellings for the labouring classes in Manchester and Salford, held on Friday, it was decided to form a joint-stock company to be called "The Manchester and Salford Dwellings Corporation, Limited," with a capital of £250,000 in £5 shares. Plans were produced by Mr. J. Corbett of the suggested class of block of dwellings, and were referred to the committee.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Exeter.—The architects of this city have recently formed an Architectural Association with the following as officers for the ensuing year: President, Mr. John Hayward; Vice-president, Mr. R. Medley Fulford. Council: Messrs. J. Crocker, E. H. Harbottle, J. Jerman and J. M. Pinn. Hon. Sec.: Mr. E. G. Warren.

CHIPS.

Mr. E. H. Shorland, of Manchester, has just supplied his patent warm-air ventilating Manchester grates to St. Agnes Schools, Birch-in-Rusholme, near Manchester.

The South Wales Manure Company intend erecting temporary slaughter-houses and stables at Cardiff, from plans by Mr. Charles C. Jones, Cardiff.

Memorial stones were laid on the 21st inst., at Cockshutt, Salop, of a Primitive Methodist church and school, to cost about £700. The building will be of a Gothic character, with Ruabon red brick facings and Grinsill stone dressings. The plans have been prepared by Mr. A. Tomkinson, architect, Tunstall, and the contractors are Mr. J. Wood and Son, of Willaston.

A new Roman Catholic church is in course of erection at Aughrim, from plans by Mr. W. Hague of Dublin. It is Early Gothic in style, consisting of a nave and chancel, the outside dimensions being 100ft. by 32ft. The walls and dressings are of local granite, and the roofs of pitch-pine.

The death is announced of Mr. John Wray, for the past eighteen years borough surveyor and engineer to the town commissioners of Enniskillen, and for nearly forty years assistant county surveyor for Fermanagh.

An extensive roller floor mill is about to be built at the East Bute Docks, near Cardiff, at an outlay of about £30,000. Mr. S. Rooney, of Cardiff, is the architect, and Messrs. W. Thomas and Co., of the same town, are the contractors.

NOS. 13 AND 14, CHARING CROSS ROAD.

THESE premises, which are situate at the corner of Denmark-street and Charing Cross-road, have recently been erected for Mr. J. Tongue by Messrs. Patman and Fotheringham.

Two stained-glass windows, executed by Messrs. William Morris and Co., of Merton Abbey, have this week been placed in the western ends of the north and south aisles of Leigh parish church. They were drawn by Mr. E. Burne-Jones, A.R.A., and present "Prayer" and "Praise," being the last of a series of seven windows executed by the same firm. The figures in the lower lights of the "Prayer" window are Enoch and Elijah; in those of the "Praise" window, David and Solomon; while in the upper lights of each window a path appears and reappears leading upward, fenced and protected by angels, who are also looking upward. The tracery at the top is filled with the figure of an angel and sapphire templates.

The local board of Knaresborough adopted on Monday plans and a scheme prepared by M. Baldwin, of Houghton-le Spring, for dealing with the sewage from both sides of the town on land near Grimbald Bridge, where it would be used for irrigation. The estimated outlay is £8,000; but at present only the first section of the scheme, dealing with the eastern, or most thickly populated part of Knaresborough, will be carried out.

The town council of Newcastle-on-Tyne have, by a large majority, rejected a committee's plans for altering the present inadequate Town Hall and Municipal Offices, and decided to make only temporary changes at the existing buildings, referring to a committee the question of providing a new town hall on a site yet to be defined.

BUILDERS' BENEVOLENT INSTITUTION.

THE forty-third annual meeting of this institution took place on Thursday, the 24th July, at 4, Vernon-place, Bloomsbury-square, W.C. Mr. George Plucknett, J.P. (hon. treasurer), occupied the chair in the unavoidable absence of Mr. J. W. Hobbs, J.P. (president). The report was read, in which the committee congratulated the subscribers on the circumstance that the income from all sources had been sufficient to meet the necessary expenditure of the year. This gave great satisfaction to the committee, and they desired to express their hearty thanks to Mr. J. W. Hobbs, J.P., for his able advocacy of the claims of the Institution, whereby the charity was substantially benefited. Whilst acknowledging with gratitude the success which had thus been achieved, the committee hopefully trusted that the subscribers would not relax in their annual support of the Institution, as only by persevering and united help of its well-wishers could it be made to prosper and to be continuous in effecting the good it is doing. In the year there have been four deaths of pensioners. One man and one woman had been elected by the Institute of Builders, in accordance with the terms agreed upon by the Institute and the committee. The committee, with much regret, had to report the death of Sir Samuel Morton Peto, Bart., who was a trustee and a munificent contributor to the institution. He was president so far back as the year 1852. Mr. Frederick John Dove has been appointed a trustee in the place of the deceased baronet. The annual ball realised a profit of £55 5s. The annual dinner will take place, with the consent of the Worshipful Company of Carpenters, at their hall, on Thursday, 6th November, when Mr. William Shepherd, who has kindly accepted the position of president of the institution for the ensuing year, will preside.

The CHAIRMAN moved the adoption of the report.

Mr. THOMAS STIRLING seconded the resolution, which was unanimously agreed to.

Cordial votes of thanks were passed to the president, the vice-presidents, trustees, treasurer, committee, and auditors.

The CHAIRMAN next proposed that Mr. William Shepherd be the president for the ensuing year.

Mr. CHARLES RUSSELL seconded the resolution, which was cordially adopted.

A hearty vote of thanks was then accorded to Mr. Plucknett for presiding, and the proceedings terminated.

The bronze Jubilee statue of the Queen at Winchester—one of the best known works by Mr. Alfred Gilbert, A.R.A.—has been unfortunately located from the first, and now it is undergoing a removal to a corner close to the windows of the County Council offices. When unveiled by the Princess Louise, the statue was placed in advance of the great entrance to the County Hall, but its appearance was marred by the low base on which it rested. Now the authorities are elevating and enlarging the base, but putting the whole work into the corner.

The County Council of Stirling have decided to divide the jurisdiction into three districts for county surveyors, and to offer a salary of £225 a year for the most important of these, the eastern one, and £200 for each of the other two.

WAYSIDE NOTES.

HE Watkin Tower scheme has latterly been somewhat modest and retiring. Until the ent announcement that Sir Benjamin Baker s appointed engineer to the Tower Company, le was known as to the intention of the pro- ers, although certain rumours as to a site near rrow were abroad. Towards the end of last ek, however, some particulars as to the pro- ed position, &c., of the tower were given ing the course of an address by Sir Edward itkin to the shareholders of the Metropolitan ilway Company, at their half-yearly meeting. would appear, therefore, that the Metro- itan Company and the Tower Company, ough not in reality one and the same concern, y, for all practical purposes, be in future ognised as closely allied; for they have one l the same chairman, who, on the strength of readiness to "put a little of his money into Tower," advises shareholders in the railway do likewise. Moreover, it seems that with a w of accommodating the Tower Company the lway directors have purchased 28 acres of ound at Wembley Park, "ten minutes by press. train from Baker-street Station"; and Tower people have under their consideration question of using this site to erect their glish Eiffel, with a new station to be placed nveniently on the spot.

Also, Sir Edward proceeded to lay on the rose- our to the proposed structure, justifying nself possibly by the fact that the Eiffel iron- rk was of a ruddy hue. Otherwise, I do not how, from a financial point of view, com- risons can be made between the success of the wer in the centre of Paris, inaugurated, too, the time of a world's fair of unparalleled lendour and extent, and a similar structure, en minutes by express train from a metro- litan railway station," remarkable chiefly for sulphurous atmosphere, and only fashionable the Eton *v.* Harrow day. But these financial nsiderations do not greatly concern ourselves, d I would gladly abandon any hostile attitude therto shown in these columns, since now the wer is to be sufficiently far removed from the etropolis to prevent its becoming an intolerable d over-bearing eyesore. Although from ints of view elevated above the average ane of London chimney-pots, such as the acus of the Monument, the Stone and olden galleries of St. Paul's, and the summit Bow steeple, and less breezy elevations even an these, we may, at times, be able to e the iron monster breaking the distant rizon, he yet will not peer down into un- pected nooks and crannies, as he would have ne had a central site been selected. We may, erefore, now regard the proposed tower scheme a harmless adventure, providing we hold no ares in the concern, and may interest ourselves its progress and development. Unfortunately, e are at present much in the dark as to proposed tentions. I would imagine, however, that Sir enjamin Baker is to take in hand the design aced first in that memorable, nightmare-like mpetition, and to carry it into execution. his would certainly be rather hard on the de- gners; but I believe there was nothing stated the instructions to competitors as to the carry- g out of the design, and it is equally certain at it would not be easy to name a better man r the work in hand than Sir Benjamin de orth Bridge. Considering the nature of his ex- rience, we may safely conclude that—financial rangements going smoothly—the commence- ent of the tower will be tantamount to its mpletion.

In country districts the relative cost of site and ilding will rarely bear any comparison: so it ften happens in the heart of the City of London, aly here it is all the other way about. The orks to be done in the enlargement of Liverpool- reet Station, I learn from the G.E.R. Com- any's meeting, will cost between £300,000 and 400,000. The land required will cost the com- any no less than £700,000. The example may ot be so fair as it might, possibly, because in ne extension of the station it may be that much f the land required will merely be metalled and ft uncovered by buildings; at the same time ne figures are instructive, and give an idea of ne value of land on the east side of the present ation buildings.

The additions to the Great Eastern Railway Company's terminus are to be executed with despatch. They have only recently commenced work on the proposed extensions, yet Mr. C. H. Parkes, the chairman of the company, states that they hoped to be able to utilise some portions of the new buildings for the suburban traffic by the end of August. The new accommodation will be a great relief to the station, especially as regards the main line platforms, at present too small and ill-adapted for the purposes they have to serve. When complete, there will be six lines of rail *into* Liverpool-street Station, a fact that will do away with the necessity, as at present existing, and contrary to first principles of railway engineering, for trains entering the station to cross one another's road. In connection with the station improvements will be the enlargement of the Liverpool-street Hotel; and not the least noteworthy of Mr. Parkes' statements, with reference to the future of the Company's terminus, is that referring to the increased facilities for providing for the accommodation of the working classes. In facilitating a solution of a problem, to which I recently referred—viz., the rehousing of poor people turned out of their homes by improvement schemes, the Great Eastern Railway Company has done much good work. It issues tickets at such nominal rates as to enable the most poorly-paid artisan or operative to reside in the open country instead of the slums and rookeries of London. The easy hours of the modern British working man should enable immense numbers to avail themselves of these facilities; and, from the G.E.R. Chairman's remarks, I imagine that they *have* been thus appreciated, and to such an extent as to need additional and special provisions for the traffic.

It is a little unfortunate that the most desirable of the Metropolitan improvements proposed by a committee of the County Council should not have been agreed to by the Council. Between St. Mary Abbott's and Kensington Court there is a restricted thoroughfare that must appear to the least observant eye out of keeping with the surroundings, and wholly inadequate for the daily traffic east and west. The Metropolitan Board of Works failed to remedy the defect, and now the County Council have not arrived at any decision in the matter. In this case, however, one cannot blame the Council, for it seems that it is the Kensington Vestry that is at fault. That close-fisted corporation would like to have all the fun of the fair, and no paying. In all the other improvements arranged by the London County Council, the local authorities have agreed to pay from one-quarter to one-half of the expenses entailed. Not so the Kensington Vestry, which refuses to contribute anything to the proposed widening of the great highway through this district. Whilst arguing that the improvement would be for the benefit of the community in general rather than for their own district, they must know well enough that it would enhance the values of the adjoining neighbourhood, and generally promote the welfare of Kensington. In throwing over the whole matter, therefore, the County Council have done wisely. It is a pity, indeed, that the Council cannot in some way compel the Kensington Vestry to pay the moderate demand made; for the narrow roadway hinders traffic, and thus becomes a public nuisance which the local authorities should be made to remove. For the present the Council does well in leaving the selfish vestry to itself.

There is now a good chance that matters relating to line of frontage, hitherto the cause of so much unpleasantness, may be future progress more smoothly. Under Clauses 30 to 41, in the London County Council Bill, appeal will be allowed against the decision of the superintending architect to a tribunal consisting of one member appointed by the County Council, one by the Council of the Royal Institute of British Architects, and one by the Council of the Institution of Surveyors. On Tuesday last, at the continued consideration of the L.C.C. Bill by a committee of the House of Lords, Mr. Henry Currey was examined as to the desirability of the proposed tribunal of appeal, and stated that he considered it advisable that there should be an appeal against the decision of the superintending architect as to the general line of building, and that the tribunal of appeal proposed by the Bill was a satisfactory one. All architects will agree with Mr. Currey as to the usefulness of the proposed tribunal. It should constitute a safeguard against the many disagreements, heart-burnings, and annoyances caused by questions of frontage. The Bill, as most persons will be aware, is not yet law, but it is going on that way, the chairman of the committee announcing on Tuesday that the consideration of the clauses dealing with the question of appeal against decisions as to frontage, and other matters touching building legislation, would be proceeded with.

Judging by the aspect of your correspondence columns last week, the competition world is in anything but a contented frame of mind. I fear that so long as competitions remain there will be complaints, for where there is not genuine cause for complaint—in the one instance out of six—competitors imagine grievances. Mr. Duffield's complaint, however, is, so far as I can gather, more than usually justified by the facts of the case. Readers may remember what I said as to the upshot of the West Hartlepool Brewery Competition, about as abominable as can well be imagined, if the information vouchsafed me was correct. "X. Y. Z." has a grievance if his facts are as stated, and one that he shares with other competitors. But it appears to be the old question—If in a competition the promoters find a plan disregarding conditions, but more to their taste, are they to refrain from adopting it? It is to be feared, whilst human nature remains as at present constituted, that the answer must be in the negative, hard as it may seem to the other competitors. A somewhat similar principle may be applied in Messrs. C. O. Ellison and Son's case, though that firm have some cause to complain of what appears to be a new-born drawback to dual competitions. At the same time, if by the action taken the Harrogate Town Council finally got a more complete design than if they had acted as your correspondents would have desired, is it to be expected that they would have followed the latter course? I fear in this world that the hope is vain. In the near future competitions may be differently conducted, but at present I am afraid that there are many little imperfections from which competitors must suffer, actually or in imagination, and that architects must recognise this or leave competitions to others who agree to put up with a certain amount of chance-dealing. None the less should we constantly strive to blot out these defects in the competition system. GOTH.

CHIPS.

The local board of Burnham, Somerset, have appointed Mr. Robt. A. Wilson as their surveyor, waterworks manager, and inspector of nuisances, in succession to Mr. John H. Palmer, resigned. Mr. Wilson has been assistant to Mr. Palmer for some years, practically carrying out all the duties of above appointment. There were twenty-five applications, and the person appointed is allowed to practise as an architect and civil engineer within a radius of ten miles from Burnham.

The Royal Ophthalmic Hospital, of which the foundation-stone was laid by the Prince of Wales on Thursday in last week, is being rebuilt from designs by Mr. Keith D. Young.

According to the Allahabad *Pioneer*, the largest reservoir or artificial lake in the world is the great tank of Dhebar, 20 miles south-east of Udaipur, Rajpootana, which covers an area of 21 square miles. The masonry dam is 1,000ft. long by 95ft. high, 50ft. wide at the base, and 15ft. at the top.

Among the dissolutions of partnership announced in Friday's *Gazette* are those of Chambers and Roberts, Lowestoft and Cannon-street, City, architects; and F. and H. Francis and Sons, Old Broad-street, City, architects and surveyors, as far as regards R. F. C. Francis.

Mr. William Stringfellow, A.M.I.C.E., for the last four years assistant borough surveyor of Southampton, has been appointed assistant borough and water engineer of Cheltenham.

The memorial stone of a new chancel for St. Thomas's parish church, St. Helen's, Lancs, was laid on the 24th July. In addition to the chancel, the scheme includes the erection of several vestries, an organ chamber, heating apparatus, &c., and the contract, for £2,800, has been taken by Colonel Rothwell, of St. Helen's. The work is being carried out from plans and designs prepared by Messrs. Aldridge and Deacon, of Liverpool, and will be completed in March next.

On Saturday morning a destructive fire broke out at 6, Orange-street, Red Lion-square, W.C., on the premises of Mr. J. T. Bassano, plumber, and resulted in the destruction of the entire premises.

CONTEMPORARY BRITISH ARCHITECTS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THIS double-page assemblage forms the eighteenth group of portraits given in the BUILDING NEWS of living British architects in this series since the commencement of the year. The first photograph on the sheet is that of Mr. George Corson, of Leeds, who was articled to the late Walter Newall, of Dumfries, an architect of large practice in the south of Scotland, and who contributed many drawings and specifications of executed works to Loudon's "Encyclopædia of Architecture." Mr. Corson has had an extensive practice in Leeds and its district for many years. The Municipal Buildings, Free Library, and School Board Offices were built some years ago from his designs at a cost of about £100,000, and the Grand Theatre at a cost of over £60,000 for land and buildings. He is now engaged upon a large extension of the Leeds General Infirmary, and the following are among his past works:—The Leeds Medical School in Park-street, 1864; in Park-row, Leeds, the offices of the Scottish Widows' Fund, and business premises for Mr. A. Ramsden and Messrs. Headland; in Wellington-street, warehouses for Messrs. Sykes, Cooper (two), Lupton (following one by W. R. Corson, of Manchester), and Ledgard (three); in Commercial-street, business premises for Messrs. Harvey and Reynolds; in East Parade, auction rooms for Hepper and Sons, and for the same firm a horse and carriage repository and auction rooms in York-place and Park-place; for the Leeds Infirmary, nurses' house and other works; the brewery of Messrs. J. Tetley and Son almost entirely reconstructed; a mansion for the late F. W. Tetley, at Foxhill, near Leeds, and another at Spenfield for J. W. Oxley, banker; St. Clement's, St. Silas', and St. Edmund's churches; parsonages for these and for St. Simon's, and schools for St. Silas' and St. Mark's; board schools at Bewerley-street (the first under the Act), and Green-lane, Leeds, and at Pateley Bridge, and a house for Mr. Ingleby at the latter place; at Bradford, a warehouse in Scotch Baronial style for Mr. Walter Dunlop; at Ripon, extensive additions to the grammar-school, and schools at Hampsthwaite; at Headingley, his own residence, Dunearn, St. Michael's Mount, St. Ives, the Parish Institute, and the cemetery, chapels, and lodge at Lawn's Wood; and a number of other houses in the neighbourhood of Leeds, and additions to others. In competitions, besides the buildings carried out, he obtained the first prize of 750 guineas in the first competition for the Glasgow Municipal Buildings—this was not proceeded with, however, owing to the action of the assessor, Mr. Charles Barry, who advised the Corporation privately that the proposed expenditure ought to be increased from £150,000 to £250,000; the first prize of 300 guineas for designs for laying out Roundhay Park for the Leeds Corporation, which, however, was not carried out, the little that was done being intrusted to the borough surveyor; the second premium for the Leeds Royal Exchange, the third premium for Nottingham Municipal Buildings, and the second for Burnley. He has also acted as assessor in several competitions, quite recently in that for the Montpellier Baths at Harrogate. Mr. Corson was the first president of the Leeds Architectural Society. The portrait given is by Mr. Donald McIver, of Leeds.

Mr. James Lewis Thomas is a native of South Wales, and was educated at Christ's College, Brecon, and King's College, London. After finishing his articles in Wales he was for some time in the office of Messrs. Grissell and Peto at the Houses of Parliament to learn measuring. In 1844 he was appointed by the Master-General of the Ordnance to the Royal Engineer Department, and was employed at the Tower of London under F.M. Sir Linton Simmons, R.E., in superintending the erection of the Waterloo Barracks, designing the officers' quarters, and restoring the old towers in the Ballium Wall, for which the experience gained at the Houses of Parliament eminently qualified him. He then served from 1848 to 1854 in the West Indies, and while quartered in Antigua was appointed Colonial Architect by Governor Mackintosh with the consent of the Master-General of the Ordnance, for the purpose of restoring the public buildings and churches destroyed in a disastrous earthquake and hurricane. On returning to England in 1855, during the Crimean War, he was appointed permanently to the War Office as deputy surveyor, and in that capacity designed the Royal Victoria Hospital, Netley, and had the honour of exhibiting his drawing of the buildings in bird's-eye perspective to the Queen on the occasion of her Majesty laying the foundation-stone on the 19th May, 1856. The Permanent Barracks at Aldershot were also designed by Mr. Thomas, as well as the Royal Pavilion, on which occasion he was honoured with the personal advice of the late Prince Consort. During his long service at the War Office many other important public works too numerous to mention in all parts of the United Kingdom and abroad were designed by Mr. Thomas. The Memorial Convalescent Cottage Home at Bournemouth, erected to the memory of the late Lord Herbert of Lea, who during his presidency at the War Office as Secretary of State was conspicuous for his devotion to the comfort of the soldier and as the great pioneer of sanitary reform, was also designed by Mr. Thomas and presented to the committee as a tribute of respectful regard for the memory of his revered chief. In the progress of this work Mr. Thomas had the benefit of Miss Florence Nightingale's advice, who afterwards selected that design to illustrate one of her works on hospital construction. In 1882 Mr. Childers, the Secretary of State for War, appointed Mr. Thomas Chief Surveyor of the War Department, which appointment he now holds. He was elected a Fellow of the Royal Geographical Society in 1872; Fellow of the Society of Antiquaries in 1879; Fellow of the Royal Archæological Society in 1880; Fellow of the Royal Colonial Society, and Member of the Society of Arts. In Freemasonry, Mr. Thomas is a Past Grand Officer in the United Grand Lodge of England since 1878. In 1851 he was married to the eldest daughter and co-heiress of the Hon. Henry Cecil Hodges, nephew of the first Marquess of Exeter, by whom he has several sons. The portrait is by the London Stereoscopic Company.

Mr. Wm. Landless, architect to the Leeds School Board, had the advantage of being trained in the office of his uncle—Mr. Burnet, of Glasgow—who for many years has carried on an extensive practice in the city of Glasgow and throughout the West of Scotland. Mr. Landless was born in 1847, and commenced business on his own account about the year 1873. It was at this time that the Tramway Act became law, and Mr. Landless was largely employed by the Directorate. He has also accomplished a variety of work in and around Glasgow, both for commercial and domestic purposes, his principal building, and the one by which he is best known, being the Glasgow Asylum for the Blind, opened by Lord Rosebery; a large structure designed in the Scottish Baronial style, situate to the north of the cathedral and distinguished by its hexagonal tower and spire. Mr. Landless was latterly occupied in the building of schools, and has carried out some of the schools erected by the Glasgow Board; he has also been employed by the Govan School Board, having erected for that body the large school situate on the lands of Partick-hill, which was opened by the late Mr. Craig-Sellar, M.P. Mr. Landless's connection with school boards and his experience gained thereby led to his present appointment in 1889 under the Leeds School Board, to which body he had previously rendered preliminary services. He has at the present time four new schools on hand, as well as additions to older ones. Mr. Landless held the office of hon. treasurer to the Glasgow Institute of Architects for some years, and was vice-president, and subsequently president, of the Architectural Section of the Philosophical Society of Glasgow. The portrait is from a photograph by Messrs. Wormald, of Leeds.

Prof. T. Hayter Lewis, F.S.A., was born on 9th July, 1818. He was articled pupil to the late Mr. Joseph Parkinson, of Sackville-street, Piccadilly, in 1837 was admitted as a student of the Royal Academy, and in 1839 won a silver medal of the R.A. in the class of Architecture. Afterwards he entered the office of Sir William (then Mr.) Tite, and travelled in France, Germany, Italy, Sicily, and Greece in company, for the most part, with Mr. Ewan Christian and the late Sir Horace Jones. A large number of his sketches then made were published in various numbers of the Architectural Publication Society's "Dictionary." Soon after his return he entered into partnership with Mr. T. Finden, brother of the well-known engraver. In 1860 he succeed Sir M. Digby Wyatt as hon. sec. to the R.I.B. and on resigning that office was elected one the vice-presidents. In 1864 he was appoin as one of the examiners (at first in conjunct with the late Sir G. G. Scott and Art Ashpitel) in the voluntary examination of Institute. In 1865 he was elected Profes of Architecture and Construction at Univers College, where, in 1871, he acted as Dean of Faculty of Arts. In subsequent years he ag travelled in Germany, Italy, Greece, Alge Egypt, Palestine, &c., papers by him relat to these countries being included in the *Trans tions* of the R.I.B.A., Biblical and Brit Archæological, and other societies. He design at various times, the Alhambra (originally b for a scientific society), the north and south si of the intended quadrangle to University Colle the schools and other extensive buildings o nected with them, many buildings for private public use in London, and mansions in vari parts of the country; but in 1869, owing severe illness, gave up the greater part of practice. In 1881 he resigned his professorsl at University College (having on two separ occasions obtained leave of absence owing continued illness), and was then elected Emeri Professor. He is the author (in addition various detached essays) of the articles "Ancient and Modern Architecture" in the n edition of the "Encyclopædia Britannica" (Mediæval portion being written by the late G. Street, R.A.), and of the annual review of arc tecture in the "Companion to the Almanac" 1885, 1886, and 1887, when he resigned, owi to his absence abroad. With Colonel Sir C. Wilson he annotated Mr. Aubrey Stewar translation of Procopius on Justinian Buildin and in 1888 wrote "The Holy Places of Je salem," published by Mr. John Murray. P fessor Lewis is one of the executive commit of the Palestine Exploration Fund, and also the Egyptian Exploration Fund and ot societies. His photograph was taken this y in Jerusalem by Mr. G. Krikorian, of that cit

Mr. Thomas Chambers Hine, F.S.A., was architect to the Nottingham Castle Museum a Gallery of Art, and originator of the proje In addition to most of the works enumerated the number of this periodical of January 1 last as executed in conjunction with his s Mr. G. T. Hine, Mr. Hine, sen., was previou concerned as architect in works mainly consist of the Great Northern Station at Nottingh and the buildings on that line between Notti ham and Grantham, three of the Nottingh churches, the General Hospital, and Corn change, and some thirty of the principal wa houses and factories connected with the lace hosiery manufacture in this town; the erect or restoration of between thirty and forty pa churches in the Midland Counties, and on Ireland, various parsonage houses and school connection therewith; numerous domestic other buildings in Nottingham, Liverp Newark, Grantham, and Peterborough; Bentinck Memorial, Mansfield; Broughton H near Manchester; Cranfield Court, in Bedfo shire; and the partial rebuilding of Appl Hall, Leicestershire; Ogston Hall, Derbysh and Flintham and Gonalstone Halls in Notti hamshire; also, since 1854, the laying-ou the Nottingham Park estate, and the erectio houses thereon, under the administration of fifth Duke of Newcastle and the trustees of present Duke. The portrait is from the can of Mr. Arthur Neale, of Nottingham.

Mr. G. C. Inskip, F.R.I.B.A., the Presi of the Royal Victorian Institute of Architect partner of the well-known firm of Inskip Robertson, architects, &c., Melbourne, is second son of the late Mr. Harry Inskip, a l mill-owner of Hertford, who was well kn and respected in Hertfordshire and adjoi counties. Mr. Inskip was educated at Brig in Sussex, and finally completed his studie Germany under the Rev. A. Dammann, D.D Hanover, during which time he visited man the principal cities of Europe. Mr. Inskip articled to Messrs. Tress and Chambers Queen-street, in the City of London, archit in extensive practice, being architects to sev of the large City companies, and surveyor some of the City parishes. Mr. Inskip completing his articles paid several visits to Continent to complete his architectural stu On first arriving in Australia he practised profession for several years in Stawell, wher

an extensive practice. Some seven years Mr. Inskip visited Western Australia as tect for the Union Bank of Australia, Ld., ank buildings for this corporation in Perth, antle, Geraldton, Roebourne, and Albany erected from his designs. Mr. Inskip was rchitect for the head office of the Western ralian Bank, Perth, and was appointed tect to superintend the erection of the Perth edral, which is now nearly completed, the nal plans of which were prepared by the late Blackett, of Sydney. Mr. Inskip has erected ge number of important buildings in Vic- and neighbouring colonies, amongst others tawell Free Library, several churches, ware- es, shops, hotels, mills, hospitals (including lelbourne Convalescent Hospital for Women), esidences of the late Mr. D. McKellar, of ella Station, Mr. Chas. Ayrey, of War- oke Station, and several large residences in uburbs of Melbourne, and many bank build- in various parts of the colony, and has per- had as varied a practice as any architect in olony. Mr. Inskip is a Fellow of the Royal itute of British Architects, London; a Fellow ie Royal Victorian Institute of British Archi- ; a member of the Royal Society of Victoria, His portrait was taken by Messrs. John- e, O'Shannessy and Co., of Melbourne.

r. George Truefitt, F.R.I.B.A., whose por- we give to-day, was a pupil at the age of f the elder Cottingham. He was articled five years, and then had an appointment at with the late Sancton Wood, and afterwards Eginton, of Worcester. He then went his friend, Calverd Vaux, on a walking through France and Germany, taking ween 400 and 500 sketches. On his return, ough very young, he competed for the Army Navy Club in Pall Mall, a most successful petition for him, as his design brought him of the best of friends and clients in Mr., w Sir) William Cunliffe Brooks, M.P., for om he has worked ever since. Mr. Truefitt erected buildings in 25 different counties; he put up 15 churches and chapels, including St. rge's, Tufnell Park; St. George's, Worthing; John's, Bromley, Kent; Davyhulme church, shire; Blakemere, Herefordshire, &c.; and ored 10 churches. He has erected 8 rectory ses; 7 schools; 13 banks in London, Man- ster, Altrincham, Blackburn; 7 large halls church rooms; 170 houses and mansions, luding a large house at Antibes, in the South France; 20 various buildings; 44 cottages lodges. Amongst his works he has laid out ge sums of money in the forest of Glen Tana, erdeenshire, for Sir William Brooks, in hitectural buildings, and he is now engaged extensive restorations and additions to Aboyne stle (also in Aberdeenshire), the residence of Marquis of Huntly. He has also been hitect to the Tufnell estate for over 20 years. . Truefitt has been, and is, a hard worker, he nself having made the whole of his designs, wings, working drawings, specifications, and spective, coloured, or in pen and ink. Com- itions have therefore been easy with him, as y never cost him anything but his own time, I he reckons that of all the work he has done, out three-fourths of it has been the result of npetitions—a good hint to young men. Mr. uefitt is now giving up his London practice his elder son and a cousin, a former pupil, himself now residing at his picturesque home Shelsley Lodge, Worthing, which is filled th choice curiosities which he has been col- ting ever since he was first a pupil; and here good health, which we wish he may continue he will go on with his Scotch work, and so t quite give up his professional duties which ve always been such a pleasure to him, but so to give him plenty of time to enjoy the auties of a seaside life to the end of the apter.

Mr. William Bell has been connected with the orth-Eastern Railway Company for about 30 ars, the last 12 of which he has acted as archi- ct to the railway company; during which time has carried out a very many large and im- rtant buildings on the system at various places tween the Humber and the Tweed. Amongst hich are the completion of York Station and otel, additions to Leeds Station; new stations Darlington, Sunderland, &c.; warehouses at Vest Hartlepool, Tyne Dock, Hull, &c.; loco- otive and carriage works at Gateshead, Dar- agton, York, and Hull; and at the present me is carrying out extensive additions to the Station Hotel at Newcastle. The photograph given herewith is by Mr. W. P. Glaisby, of York.

CHIPS.

On Saturday the King of the Belgians opened the new Musée des Beaux-Arts, Antwerp, which has been designed by MM. Winders and Van Dyck. It is one of the largest buildings in Belgium, and shows the works of art to great advantage as to lighting and classification.

The Local Board of Bideford have adopted plans submitted by Mr. Baldwin Latham, C.E., for an additional storage reservoir at Bideford. The work will be entrusted to Mr. Baldwin Latham's superintendence. The new reservoir will be situated at the head of the existing reservoir; it will hold at least ten million gallons of water, and will probably cost rather under £5,000, exclusive of a piece of land yet to be acquired.

A committee has been formed for raising a memorial in Manchester Cathedral to the late Dean Oakley.

A public park is about to be provided for the city of Wakefield, partly by gifts in land and money, and partly by subscriptions, the latter amounting to £3,600. An area of 28 acres will be secured, including Lawe Hill and the adjoining plateau.

The Bishop of Bedford consecrated the new south aisle of the Martyrs' Memorial Church, in St. John's-road, Clerkenwell, on Saturday afternoon.

A sub-committee of the Edinburgh town council have commissioned Mr. Charles McBride to execute a marble bust of Mr. Andrew Carnegie, to be placed in the new Public Library just completed from Mr. G. Washington Browne's designs. In recognition of Mr. Carnegie's generous gift to that institution, the town council recently voted one hundred guineas for the bust.

Mr. Alexander Saunderson, builder, of Whittington, Salop, got into a wrong train at Oswestry one day last week, and hastily leaped from it while in motion, rolling beneath the carriages. His left leg has been amputated below the knee, and he is making a good recovery.

The Warneford Hospital at Leamington is about to be altered and enlarged, from plans by Mr. Keith D. Young, of London. The works will include the provision of better sleeping accommodation, a recreation and dining-room for the nurses, rooms for a junior house-surgeon, and more beds for the patients. The outlay will be between £8,000 and £9,000.

The Lords Committee have passed the preamble of the Bill for removing gates and bars from the streets of London. They decided that it was not necessary to insert a compensation clause; but they desired that a clause should be prepared providing that wood pavement shall be put down where it may be considered necessary. The Bill has now passed both Houses.

The parish church of St. Nicholas, Great Yarmouth, the largest parish church in England, is now entering upon its fifth portion of restoration. The parts under treatment are the north and south chancel aisles, and £5,000 is required to carry the works out. The main features of this restoration consist in rebuilding the two large eastern windows, both of enormous size, and of restoring both roofs.

Justices Day and Grantham have granted a rule calling upon the Vestry of St. Mary, Newington, to show cause why a mandamus should not issue requiring the vestry to approve a plan of drainage at the New-street Station of the City and Southwark Subway, the Vestry having declined to do so because the station was built in advance of the building line.

M. Bernhofer, an Austrian engineer, has found that Portland cement resists the action of frost better when mixed with soda. One of his experiments consisted in making a mortar composed of one litre of cement, one litre of lime, three litres of river sand, mixed with two litres of water, in which one litre of crystallised soda had been dissolved. The mortar withstood a temperature of 31½° below zero Centigrade, and a subsequent baking in an oven.

On Wednesday week the foundation-stones of a new Wesleyan Chapel, for Stanley, in the Shotley Bridge and Consett Circuit, co. Durham, were laid. The design is Early English. Accommodation is to be provided for 400 worshippers, and the cost is estimated at £1,600. The architects are Messrs. John Smith and Son, Shotley Bridge, while the contractors are Messrs. Routledge, Dunfield Plain, and Mordue, of Dipton.

The corner-stone of a new north aisle was laid on Friday at Mexborough parish church, under the auspices of the Phœnix Lodge of Freemasons, by the Grand Master of the West Riding of Yorkshire. It is proposed to raise about £600 for the work of restoration.

Building Intelligence.

BINGLEY.—A new cottage hospital built and furnished at a cost of £2,500 has just been opened on the side of Ferncliffe Hill, overlooking the Aire Valley. It has been erected from the designs of Messrs. Armistead and Parkinson, of Bingley and Bradford. It has a south-westerly aspect, and the frontage is 78ft. A verandah is provided in the front of the hospital, and a corridor runs the full length of the building, lighted by a window at each end, the lavatories being placed at the ends. The front is occupied by male and female wards of five beds each, and rooms for the convalescents and the matron, the male ward and the convalescent room being to the right. The full length of the back of the building is occupied by two single-bed wards, matron's and nurses' rooms, medical officer's room, and bath-room. At the rear in a separate wing are the kitchen and domestic offices, whilst on the first floor in the front are two spare rooms. The woodwork throughout is of pitch-pine, varnished, and the walls and ceilings are of white plaster. The heating has been carried out by Messrs. Constantine, of Manchester. Fireplaces are also fixed in the rooms. The vitiated air will be extracted by Boyle's ventilators. The building is of one story, and is built of pitch-faced stone, with ashlar dressings. The chief contractors were:—Mason's work, Mr. W. Foster, Bingley; joiners, Messrs. W. R. and R. Atkinson, Bingley; and plumbers, Mr. C. Howroyd, Bradford.

DUNBLANE.—In the course of the restoration of the cathedral, now in progress from plans by Mr. Rowand Anderson, of Edinburgh, there has been found embedded in the south wall of the south aisle, and partly in the wall of the tower, just above the main door entrance in this aisle, a stone pillar. It has been taken out altogether and laid aside for further examination. The pillar measures 4ft. long and is 18in. in diameter. There is no trace of what it could be supporting, although its foundation was well packed. The work of restoration is making good progress, and the south aisle is nearly complete. The keystone of a window has just been put in in the south aisle. It rises to a height of 30ft., with three columns, and is surmounted with tracery work. All the upper portion of this window is new, and there was little or nothing to guide the architect in his design, as the window has been minus the traceried head for centuries, but the reconstruction is in harmony with the rest of the building.

EDINBURGH.—The commemoration stone of the new asylum for the insane at Craighouse, near Edinburgh, has been laid by the Earl of Stair. In 1878 the managers acquired from the late Col. Gordon of Cluny the estate of Craighouse, the old mansion of which was at once utilised as a retreat for patients of the higher class. The managers finally resolved to build a new asylum, with detached villa residences, a little to the west of the old mansion-house, the latter being still retained in its entirety. The new asylum is designed to accommodate about 150 patients of the better class. The plans were prepared by Mr. Sydney Mitchell from rough designs by Dr. Clouston, the physician-superintendent of the Institution. The cost as contracted for will amount to nearly £66,000, besides outlay on heating, painting, furnishing, &c. Mr. Lownie is the contractor.

NATIONAL ASSOCIATION OF BUILDERS OF GREAT BRITAIN.—The annual meeting of this association was held in the Hartley Institution, Southampton, on Wednesday week. Representatives from London, Liverpool, Manchester, Hull, Sheffield, Bristol, and most of the other large towns in the kingdom attended. At the general meeting the labour question, the Employers' Liability Bill, and the arrangement with the Royal Institute of British Architects for a new form of contract were the subjects discussed. The members dined together at the South-Western Hotel in the evening.

PENTRE. — St. Peter's Church, Pentre, Glamorganshire, was consecrated on Monday, the 28th ult. Mr. F. R. Kempson, of Birchyfield, Herefordshire, is the architect. The design consists of a lofty nave, side aisles, western tower, south porch, chancel, chancel aisles, roofed transept-wise, and having upper floors in each for organ and auxiliary choir, and morning chapel. There are clergy and choir vestries, a

connecting passage behind the east wall of the chancel, which gives direct communication between the clergy vestry and morning chapel. The architecture is of thirteenth-century character throughout. Free use has been made of constructional colour in a variety of different kinds of stone, brickwork, alabaster, marbles, mosaic, tiles, and painted glass. The reredos is in alabaster, combined with marbles, mosaic, and sculpture. Above the reredos is a great triplet, which occupies the whole width of the chancel, the lights being filled with painted glass representing the "Ascension." The completion of this subject is in mosaic (not yet fixed) which extends over the arches of triplet up to the line of the roof. The pulpit is in stone of different colours. The font is composed of a variety of richly-coloured marbles. The morning chapel has a reredos in mosaic with three lights over it, of which the upper one is filled with painted glass representing our Saviour as "The Redeemer," and the lower one figures of "St. Peter" and "St. John." The works have been carried out by Mr. Thomas Collins of Tewkesbury.

Stamford.—The parish church of St. Mary is undergoing an extensive scheme of restoration from plans by Mr. John D. Sedding, of London. The chancel is to be entirely repaved in marble and stone, and the chancel roof is to be decorated. Screens will be put up between the chancel and side chapels and the nave, and parclose screens between the side chapels and the chancel. The old heating apparatus has been removed, and a system of heating introduced which has involved relaying the floor of the nave. This will be paved with stone, while wood blocks will form the flooring beneath the sittings. One of the important alterations will be the removal of the organ from the north to the south side of the chancel. It has hitherto stood in the Golden Choir, the chapel of our Lady and a former chantry. By the organ's removal the architectural features of the chantry, in which a new stained east window will be placed, will be opened to view. An altar will also be erected in the chapel, so that it can be utilised for morning service. At the junction of the wall of the north aisle with the Lady-chapel the doors and stairway leading to the rood-loft have been discovered and opened out. The walls of the church will be cleansed, the altar raised, and new seats for clergy and choir are to be put up. The contractors for the nave are Messrs. Roberts, of Stamford, and for the chancel Messrs. Trask, of Norton, Somerset. The cost of the general outlay on repairs will amount to over £2,500.

Walker-on-Tyne.—A brass-foundry has just been completed at Walker for Messrs. John Mills and Sons, whose premises in Forth-street, Newcastle, have been acquired by the North Eastern Railway Company. The site is bounded by roads on three sides, and covers an acre of land. The buildings already finished are ranged round two sides of the site, the large brass-foundry being placed in the centre of the site. The chief offices and stores abut on the road from Newcastle to Shields, the length of frontage being over 200ft. The office block includes on ground floor the clerks' and cashier's offices, lavatory, and staircase, and on the first floor rooms of the principals, experimenting and other private apartments. The principal workshop for turning and finishing is 130ft. by 38ft., and has a high open roof, ventilated with extracting and inlet shafts, and lighted with windows having arched heads. Opening off this shop are the foreman's office, fitters, polishing, and pattern shops, pipe store, &c. The brass-foundry, 80ft. by 40ft., is 30ft. high, and is fitted with travelling cranes, crucibles, casting pits, stoves for tempering, &c. The boiler-house adjoins, as well as the smithy. The chimney stack from the boiler-house terminates in a cornice, having mosaic panels, with the name of the firm worked in. The showrooms and stores for lighter articles and electricians' shops are placed on the first floor, accessible from shops below. The chief external elevation is broken up with pilasters dividing the windows, and continued into dormers having mullioned lights and shaped Queen Anne gables. The works have been designed by Mr. W. H. Knowles, Granger-street West, Newcastle, Mr. Walter Scott being the contractor.

The foundation-stone of Kington Mission Church, Herefordshire, was laid to-day. The architects employed are Messrs. Kempson and Fowler.

Engineering Notes.

Auchmithie, N.B.—A new fishing harbour is being constructed at Auchmithie, a fishing village on the Forfarshire coast, between three and four miles north-east from Arbroath. The work will cost about £4,500, and the plans show a pierhead carried out about 65ft. from the rocks, inclosing part of the natural harbour. Taking advantage of the rocks, the new harbour runs at nearly right angles to the natural harbour for a distance of 260ft. in a north-easterly direction, and then at right angles for a further distance of 230ft. in a direction of about north-west. The works were begun in January last with the excavation of the area inclosed by the pier, which has been deepened, part of it to the extent of 2ft. below low water, and part of it to the depth of low water. It is expected that the work will be completed early next year. Mr. Barron, C.E., is the engineer, and the contractor is Mr. John Malcolm, Thurso.

PARLIAMENTARY NOTES.

The London County Council Bill.—The consideration of this Bill was continued on Tuesday before the Committee of the House of Lords.—Mr. Henry Currey, F.R.I.B.A., examined by Mr. Cripps, Q.C., said he considered it advisable that there should be an appeal against the decision of the superintending architect to the County Council as to the general line of building, and in his opinion the tribunal of appeal proposed by the Bill was a satisfactory one, consisting as it did of one member appointed by the County Council, one by the Council of the Royal Institute of British Architects, and one by the Council of the Institution of Surveyors, and a proviso being inserted to the effect that the two last-named members of the tribunal should not be members of, or in any way connected with, the Council. After hearing counsel on both sides, the Committee decided to proceed with the consideration of Clauses 30 to 41, by which the County Council sought power to approve plans under the Metropolitan Building Act, 1855; power of appeal against the certificate of the architect as to the general line of buildings; power to authorise larger buildings without party-walls; the defining of the line constituting the centre of the roadway; power to make by-laws with respect to materials for plastering and within 3ft. of sites; power with regard to the use of houses as public buildings; as to giving notice to vestries and district boards of the building or demolishing of any house, building, or wall; as to buildings abutting upon more than one street; as to the extension of any part of a building within a certain distance from the centre of the road; the laying out of new carriage-ways; as to the height of buildings; and as to the exemption of Government property from building regulations. On the clause by which it is sought to allow the room in certain warehouses and manufactories to be of larger dimensions than have hitherto been permitted, the committee accepted the principle, but wished to be satisfied that proper safeguards against fire were provided for by the wording of the clause. Capt. Shaw gave evidence on this point on Wednesday. Captain Shaw said that, having regard to the condition of the City, the crowding of warehouses, and the narrowness of the streets, the extension of the cubical capacity of buildings without the intervention of party-walls, as proposed by the County Council, from 216,000 cubic feet to 250,000 cubic feet would be specially dangerous as regards increased risk of fire, but it would be a sufficient safeguard if the Council were only to grant special consent for each enlargement upon the report of himself and of the superintending architect. The height was the most dangerous factor, and 60ft. should be the limit of height. With the safeguards suggested he would not object to see the City included. Even with the safeguarding provisions, the increase of the cubical contents of warehouses would have a perceptible influence in raising the rates of insurance of adjoining property. The committee decided to pass the clause with the safeguards proposed, the City not being exempted from its provisions.

An envelope factory erected from plans prepared by Mr. Charles C. Jones, architect, Cardiff, and Mr. H. Donnelly, C.E., of Dublin, has lately been opened in Dublin, Ireland.

The second section of the North Cornwall line, from Launceston to Delabole, a distance of 18 miles, has just been commenced by the contractors, Messrs. Curry, Reeve, and Co., of Westminster, who have also undertaken the contract for the third section, that from Delabole to the terminus at Padstow. The whole of both sections are to be opened for traffic by August, 1892.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opini our correspondents. All communications shou drawn up as briefly as possible, as there are claimants upon the space allotted to correspondent

It is particularly requested that all drawings a communications respecting illustrations or literary m should be addressed to the EDITOR of the Bu News, 332, Strand, W.C., and not to members staff by name. Delay is not unfrequently othe caused. All drawings and other communication sent at contributors' risks, and the Editor wil undertake to pay for, or be liable for, unsought con tions.

Cheques and Post-office Orders to be made paya J. Passmore Edwards.

QUESTIONS.

[10320.]—**Electric Lighting.**—Are there general rules to follow in fitting up a house wit electric light? What precautions are necessary to pr danger? and how should the wires be cased? Wh the pressure recommended?—Builder.

[10321.]—**Public Libraries.**—Can any reader me any information as to the methods of classificatio books that have been found successful in any rece established library? Any details as to the best for "indicator" and fittings will be of value.—G.

[10322.] — **Reredos.** — Is there any work gi drawings of old screens behind altars? Which is posed to be the earliest example in this country reredos?—Antiquary.

The Jarrow and Hebburn Co-operative So have adopted plans by Mr. Walter Hanson, Ja and South Shields, for extensions to their ce premises, Market square and North-street, Jar The premises will have five shops on the gro floor, and in the rear will be a slaughter-house, the first floor will be placed showrooms, workro and warehouses. On the second floor will lecture-hall, 82ft. by 36ft., and lodge and mittee rooms. The cost is £4,660.

The foundation-stone of a new public hall laid at Camborne on Thursday, July 24th. It occupy the site of a temperance hall, and include a room seated for 2,000 persons, with r ing-room, conference hall, and restaurant. front will be of Elvan stone with granite des Mr. Silvanus Trevail, of Truro, is the architect, Mr. Julian, of the same city, has taken the con for erection at £3,450.

The foundation-stone of a new workhouse St. Pancras was laid on Friday on the site o old building. The workhouse, which is to be from plans by Messrs. A. and C. Harston, wh a plain, substantial building, with better arra classification than the old one, more accomm tion for married couples, and improved sani appliances. Messrs. Kirk and Randall, of W wich, are the builders, the first contract amoun to £74,827.

LEGAL INTELLIGENCE.

T IS A "NEW" ROAD?—Messrs. Studd and ilders, of Barratt's-grove, Stoke Newing- ere summoned by the Hackney District of Works, on Friday, to show why they not pay their apportionments of paving s in respect of Barratt's-grove. The road is a very bad condition.—Mr. Ellis, Town of Hackney, said in any new road the ants thereof paid the first charges for , and the district boards took them or maintenance afterwards. In the pre- se the estimate for making up was £1,100; had been collected, but the remainder sputed by Messrs. Studd and others.—Mr. C. ng, who represented the defendants, called ber of the oldest inhabitants to speak of the on of Barratt's-grove as far back as 50 These declared that the road had at one bar across the bottom, but that it been lighted, watered, and repaired by presumably from the Hackney District of Works. — Against this Mr. Ellis Mr. Lovegrove, who has been 34 years or to the parish of Hackney, and never that period had the parish done anything to id. One side of the road was a church path, had by ecclesiastical law to be repaired.— ros said upon the evidence—though the de- its had paid local rates for 25 years in the —he was satisfied the parish had never taken he road, and therefore he should make the against the defendants.

ANCEL GATES.—A noteworthy case with regard erection of chancel gates came before the n Consistory Court on Wednesday week. pplication was for a faculty to authorise tions in the church of St. Mary, Spring- . It was proposed to convert the south el into a side chapel, to raise the floor of ancel, to move the pulpit, to remove certain so as to make a passage across the church, to make other alterations in the church. ellor Tristram said the Court was satisfied on vidence that the alterations were desirable, would decree a faculty for them except as to ates of the chancel.

RE WILLIAM HANCOCK.—The debtor, who was ibed as of St. Paul's Churchyard, also of den and elsewhere, builder, farmer, and con- r, applied on Friday to pass his examination. abilities were returned at £49,227, of which 12 were fully secured, with assets estimated ,643. The debtor, who was formerly a timber hant, commenced business as a builder in 1883 out capital, and as a farmer at Kingsclere in with an estimated capital of between £3,000 4,000. He failed as a timber merchant in the 1860 and 1870, and in 1880, when trading as a er, he affected an arrangement to pay a com- on of 4s. in the pound, but failing to carry out erms he was adjudicated bankrupt in 1882. ttributed his present failure to his inability to se of his building properties in St. Paul's churyard and at Brondesbury. The debtor d his examination.

RE WILLIAMS, FRY, AND CO.—The debtors, were cement merchants at New Stone- ings, Chancery-lane, and at Stone, Green- , Kent, applied on Saturday to pass their ination. The debtors started in business in mber, 1888, with a capital of about £3,000, sed from the sale of a laundry at Ealing. The ving order was made in May last, and the rs ascribed their failure mainly to loss of al occasioned by two actions in which they had involved, and to a liability on a guarantee n in connection with the laundry. Their lities were returned in the statement of affairs 9,347, of which £3,681 will probably rank, with stimated surplus in assets of £423. The debtors allowed to pass.

DESCRIPTIVE RIGHTS TO "WAYS OF NECES- ."—WILKES V. GREENWAY. — Judgment was n on Tuesday in the High Court of Appeal, isting of the Master of the Rolls, and Lords ices Lindley and Bowen, in an appeal from the sion of Mr. Justice Vaughan Williams. The ndant had acquired, by occupation for 12 years, le, under the Statute of Limitations, to two lens at Wolverhampton, of which the plaintiff been the owner. The plaintiff still owned the bounding these gardens on the north and east, also owned a private road which was the only ns of approach to the gardens, and which had ays been used by the defendant. The plaintiff med an injunction to prevent this user of the l, contending that, although the defendant had ired a title to the land, he had not acquired right of way over the road, since the Prescrip- Act required an uninterrupted user for 20 years the acquisition of such an easement. The ned Judge gave judgment for the defendant, ling that since a defined way was necessary to enjoyment of the gardens, the law would pre- e that somehow or other, by legal means, by at, or otherwise, that right of approach must have been created without which possession could not have been taken. The plaintiff appealed. The Court took time to consider the question, and delivered judgment allowing the appeal. In the judgment of the Court, read by the Master of the Rolls, his Lordship said: The one point argued before us has been whether, assuming the premises to have passed to the defendant by virtue of the Statute of Limitations, a right of way over this approach inevitably came into existence over the plaintiff's remaining land as a way of necessity and as distinct from any other way. Without further knowledge of the facts, we can only say that there is nothing in the Statute of Limitations to create ways of necessity. The statute does not expressly convey any title to the possessor. Its provisions are negative only. We cannot import into such negative provisions doctrines of implication that would naturally arise where title is created either by express grant or by statutory enactment. The title to the premises is not a title by grant. The doctrine of a way of necessity is only applied to a title by grant, personal or Parliamentary. The statute does not apply to a right of way. It is not contended that the statutory enactment as to easements applies. We are therefore unable to agree with the learned Judge below.

WATER SUPPLY AND SANITARY MATTERS.

DURBAN WATERWORKS EXTENSION.—The Corporation of Durban, Natal, are taking steps to push forward with their new waterworks extension as rapidly as possible. Mr. J. Fletcher, C.E., the local borough surveyor of Durban, has drawn out a preliminary scheme for taking a large supply of water from the Umlaas River, in the neighbourhood of Durban. Mr. W. H. Radford, civil engineers, Nottingham, is the consulting engineer for the scheme, and the scheme was arranged for execution in two sections. The estimated cost of the first section was £65,767, and of the second section £54,625, making a total of £120,392. The intake for the first section will be situate on the Umlaas River, ten miles from Durban. The water will be conveyed several miles down the river in 18in. iron pipes to the pumping station, where a portion of the water will be utilised to work turbines which will pump the remainder of the water to a high summit reservoir and filter beds. From the summit reservoir and filter beds the water will flow by gravitation through four miles of 15in. iron pipes delivering into three local town distributing reservoirs. When the second section is carried out, the 18in. iron pipes will be carried eight miles further up the river to a water intake at a sufficiently high level to supply the town by gravitation. When the scheme is finally completed, the works will deliver two million gallons per day.

PENDLEBURY.—Some time ago the Pendlebury Local Board decided to abate the nuisance caused by the sewage of a part of their district flowing into the Irwell, and purification works were commenced at Slack Brook, from designs of the late Mr. Robert Vawser, M.I.C.E., of Manchester. After Mr. Vawser's death, Mr. T. S. M'Callum, A.M.I.C.E., also of Manchester, was appointed engineer, and he has now brought the work to a completion. The public inauguration took place on Monday last. The system of purification adopted is that of the International Water and Sewage Purification Company, Limited. The Pendlebury works are the first in Lancashire where this company's process is in operation, although large experimental works have been set up at Weaste for trial by the Salford Corporation. Four tanks have been constructed at Slack Brook, into which the sewage flows for precipitation after the addition of the precipitant, "ferozone," by means of an automatic mixer. From the tanks the water is drawn off to filters, with contain a layer of "polarite," for the removal of the matters in solution which have not been attacked by the precipitant. From the filters the effluent is said to flow clear. The filters are made self-cleansing. The other part of the district (Swinton) has been provided with a sewage farm of 32 acres; but an injunction having been threatened with reference to the pollution of the stream, Mr. M'Callum has there constructed works of a similar nature and for the same process. These will be completed in a few weeks.

THE VENTILATION OF SEWERS.—At the recent Sanitary Conference held at Stirling, Mr. J. D. Watson, town surveyor of Arbroath, gave the results of inquiries he had made of fifty-five local authorities as to the methods adopted by them for the ventilation of the sewers and drains. Six of these towns had no system of ventilation; in ten the sewers were only partially ventilated. In the towns where ventilation had been appreciated the favourite method was to bring up a square shaft or manhole from the sewer, and protect it at the street surface by a cast-iron box, fitted with a lid partly open and partly closed. In 11 towns shafts were carried up the sides of the houses; in six there were communications with chimney stalks; in five rain-water conductors were used for ventilating purposes; in two the foul air was passed through charcoal placed in trays over the manholes; and in Blackburn the sewers were connected with special shafts for the purpose of conveying the gas above the houses. Having discussed these various methods, he recommended the adoption of the system of open manhole shafts, pointing out at the same time the imprudence of allowing exhaust steam to be blown off into the sewers, for the liberation of foul gases was likely to aggravate existing dangers.

VILLAGE WATER SUPPLY.—A scheme which has been devised by Mr. W. H. Radford, C.E., of Nottingham, for the supply of water to the village of Earls Barton, might possibly be applied successfully to other villages. As the population is only 2,500, the inhabitants do not wish to carry out works involving a large capital outlay or annual maintenance. Four wells have been sunk through porous strata situate on rising ground above the village, and good water was found on the surface of a thick clay strata at a depth of 20ft. Neither of these wells would yield sufficient in itself to supply the village, but an ample supply can be obtained by connecting the four wells together with a collecting pipe laid just below the surface of the clay. The length of the 9in. earthenware socketed collecting pipe will be 300 yards, and it will have open joints at the top of the pipe to admit water. A 4in. iron service main will be connected to the end of the collecting pipe, and will convey the water to the distributing pipes in the village. The collecting pipe is sufficiently high in level to enable the greater part of the village to be supplied by gravitation. The part of the village which is too high to be supplied by gravitation, has already a good supply from surface wells, but the scheme is arranged so that a small pump can be put down at any time to raise the water into a tank which would increase the pressure sufficiently to supply this part also. The cost of the gravitation scheme to supply those parts of the village now in need of water would only be £1,100, and the annual expense would be practically nothing. If a pump and water tank are added to supply the high part of the village, the extra cost would be £400. The scheme is now being considered by the local authorities.

STATUES, MEMORIALS, &c.

CANTERBURY.—The proposal to erect a memorial to the Canterbury martyrs, who perished during the Marian persecution, has been approved by the Archbishop of Canterbury, who suggests that if the space admits an old type of cross on steps, with the names engraved on a tablet or round the base of the shaft, would be simple and appropriate. This will be adopted, the cross held to be most suitable being the ancient form locally known as the "Canterbury cross."

CHIPS.

Mr. John Fisher, who has had charge of the Art Department at the Merchant Venturers' School at Bristol since its opening, has tendered his resignation to the committee in view of opening a school of art in that city. During the five years of his teaching Mr. Fisher's students have been awarded four silver medals, including two this year by the examiners of the Science and Art Department. Mr. Fisher, who was a student in the Sheffield School of Art, has himself gained many distinctions, including the gold medal.

Mr. Albert Webster, engineers' surveyor, of London, aged 46, was killed at Cheltenham Station by a passing train, while engaged in completing the surveys with his assistants for the proposed new station. A verdict of accidental death was returned at the inquest.

It is proposed to enlarge the present school in connection with the Wesleyan Chapel at Ashford, Kent, and also to improve the chapel by providing two vestries and building an organ-loft, &c., together with a new rostrum in place of the old pulpit. Mr. Henry J. Jeffery, M.S.A., of Ashford, has been appointed the architect, and Mr. H. Knock the builder.

A large drill-hall for the No. 11 (Weston-super-Mare) Battery, 1st Gloucester Artillery Volunteers, was opened on Saturday. The whole of the work (except the iron roof) has been done by the members of the battery from plans by and under the supervision of Mr. Charles S. Leech, architect, Weston-super-Mare.

It is said—not on very good authority perhaps—that the Dean of Norwich has a scheme for erecting a marble reredos at the east end of the presbytery of Norwich Cathedral. The effect of this will be, it is averred, to hide the only ancient bishop's throne in Britain which faces west. The design is to be intrusted "not to one of the three or four architects in Great Britain who are competent to undertake church restoration, but to a builder."

Our Office Table.

Two district surveyorships were filled up at Tuesday's meeting of the London County Council. They were those of South St. Marylebone, rendered vacant by the demise of Mr. Joseph Jennings, and East Islington, where the new appointment was also necessitated by death, that of Mr. Joseph Turner, who had long been ill. Both districts are said to bring in emoluments beyond the annual sum recently named by the County Council as that to which all such offices should be gradually equalised—£500—and while Islington will probably be the more lucrative, being less built over, Marylebone is the pleasantest from a residential point of view. Twenty-nine candidates offered themselves for the appointment, and a vote was taken in committee on 23 names. Mr. Edward J. Tarver, F.S.A., of Buckingham-street, Adelphi, who was placed first, elected to take South St. Marylebone, and was accordingly appointed to that district, and Mr. Josiah Goodchild, who obtained the next highest number of votes, was given the East Islington district. The selections have been confirmed by the County Council. Both officials will have to abandon private practice, and to reside in their respective districts.

The awards of the jury of the second annual art exhibition of Munich were published on Wednesday. The excellence of the planning and designs of Mr. Alfred Waterhouse, R.A., is, we are glad to see, recognised by the award of a first medal for architecture, and Dr. Rowand Anderson, of Edinburgh, obtains a well-deserved second medal in the same class. Among the British painters exhibiting, Mr. James Guthrie, of Glasgow, receives the first medal, and Mr. John Reid, of London, Mr. Walton, Glasgow; and Mr. Lavery Crawhall, jun., second medals. Mr. Onslow Ford, of London, obtains a second medal for sculpture. Of etchers Mr. Macbeth, Mr. Axel Haig, Mr. Walker, and Mr. Wyllie receive second medals. M. Neuhuys, the Dutch painter, obtains a first medal; and M. Van Aken, of Antwerp, and M. Struys, of Malines, M. de Boeck, of the Hague, and M. Baertsoen, of Ghent, second medals for painting.

The Suffolk County Council had again under consideration at their last meeting the claim for compensation made by Mr. Henry M. Eyton, of Ipswich, who was county surveyor from June, 1885 to April, 1889, and surveyor of buildings only till the Michaelmas following. Mr. Eyton had, at their previous meeting, been refused compensation by the county council on the ground that the appointment was an annual one, and that if any sum were voted him it would be surcharged by the official auditor, and the matter now came up afresh, as Mr. Eyton had applied to the Treasury for £500 as compensation. The Chairman again pointed out the legal aspects of the case, and proposed that the council adhere to their previous report. Alderman Biddell and others thought this would be an unjust treatment to an old servant of the county, and moved, as an amendment, that the treasury be recommended that some compensation was "equitably" due to Mr. Eyton; but it was lost by a large majority, and the committee's report was adopted. There may be more underlying this apparently harsh treatment of an old official than is seen on the surface; but the East Riding County Council have in an identical case shown that where there is a will there is a way of circumventing the Government auditor. The latter body has accepted the resignation of Mr. Thomas Simpson, for many years county surveyor for the Riding, and have appointed him consulting surveyor at a reduced salary.

The ceremony of uncovering the widely-known mosaic pavement at Woodchester, near Stroud, was performed on Tuesday by the Dean of Gloucester. The pavement lies below the surface of the old churchyard at Woodchester, and is that of a spacious hall of a Roman villa, 48ft. 10in. square. The design illustrates the legend of Orpheus playing upon his lyre, taming and charming, by the magic of his music, beasts, birds, and fishes, and attracting even trees and shrubs. Considerable damage has been done to the pavement—partly by exposure during frost, and partly by grave-digging—but sufficient remains to make the spot of great interest to antiquarians. The first recorded notice of the pavement is by Edward Shwyd in 1693. It was completely opened in 1814, and at intervals till 1880, since which time it has been covered. The Dean expressed the opinion that the villa was the residence of the chief military general of this part of the Roman dominions. The pavement will remain on view till the 11th inst.

The third examination inaugurated by the Worshipful Company of Carpenters' has just been held. This examination is stringent in character, the candidates having to present themselves on two evenings at Carpenters' Hall for the written work, on the following day they are examined in practical work at the Company's workshops at Stratford, and on the fourth day they are orally examined by the committee, consisting of the presidents of the Institute of British Architects, the Institute of Civil Engineers, the Architectural Association, the Institute of Builders, the Clerk of Works Association, Sir Philip Magnus, Sir James C. Lawrence, Professor T. Roger Smith, and Professor Banister Fletcher, &c., so that any candidate gaining the Company's certificate may fairly be considered as qualified in the subjects in which he has passed. The examiners did not award a gold medal this year, but gave the silver and two bronze medals. The successful candidates were:—1st class certificates; T. Vest (silver medal), T. J. Evans and J. Davison (bronze medals), J. Goddard, W. M. Dixon, and D. Bryant. 2nd class certificates: J. Inkpen, G. A. Mitchell, J. Davies, W. H. Masters, W. E. Cutter, and H. J. Prosser.

Additions have been made to the Congregational Hall at Blaydon-on-Tyne, and special attention has been paid to the ventilation, the extraction of the vitiated air now being effected by the latest improved form of Messrs. Robert Boyle and Son's self-acting air-pump ventilator.

The Adamant Company, Limited, have just completed the contract for plastering the new Branch Bank for the National Provincial Banking Co., recently erected in the Horse Fair, Birmingham, from the plans of Mr. H. R. Gribble, architect, London, and under the superintendence of Mr. Bampfield, clerk of works. The same company have also secured the contract for plastering to be done in the extension of National Provincial Banking for premises in Waterloo-street and Bennett's Hill, Birmingham, and also under the same architect. Messrs. J. Barnsley and Sons are contractors for the Horse Fair Bank, and Messrs. W. Sapcote and Sons for the Waterloo-street and Bennett's Hill.

ARCHITECT IN HIS RELATION TO CONTRACT WORK.

the designer and supervisor of a building, and as a general agent of the ved, acting between him and the con-r, the architect has many and important to discharge which fall to the lot of ther professional men. In his dual ty of artist and agent, he is presumed te within himself the natural talents ersatility of a Michael Angelo or a inci with the legal acumen of a ery lawyer. Can we wonder at the and disappointments of a few under assumptions? The meaning of "archi- has been vastly stretched to include a or, a measurer, a valuer, an engi- and goodness knows what else as We propose to discuss a few of bligations of the professional man. usually thought that when the is formally accepted, or the ct is signed, all difficulties are at an at the contractor has committed him- the requirements, and having signed ns and specifications, has made himself o all that is necessary, however imper- ey are. Surely that view is becoming erable. Courts of law and juries are look into any circumstance which s to be either unreasonable, or about any doubt exists. The common law le that no person can take advantage non-fulfilment of any condition the nance of which has been hindered by t is important to remember. For e, an employer or board cannot sue reach of covenant if he or they have filled any part of their duty to a con-t. If, for example, an architect or r has not supplied the necessary draw- specification in reasonable time, the tor is relieved of his obligation to te the works by the time specified. ie fails to set out the work the con- has a good ground for delay. We agine other circumstances—such as n the supply of materials which an er agreed to obtain, or indecision gard to any alteration which may en suggested after the contract had gned. These are material excuses any contractor might urge for not g out his contract.

nterpretation to be placed on draw- ad specifications is frequently a n of dispute. A clause usually t in contract conditions, to the effect case of any discrepancy between the gs and specification the architect is to which is to be followed, does not ily carry with it complete conviction mind of the contractor, nor prevent n referring the question to arbitra- The architect being the agent of the or is to a certain extent biased in his at; he is not likely to admit that the s are imperfect or inadequate. The on clause comes to the relief of the or in such a case which gives an appeal to architect's decision, to an arbitrator r to be appointed. Much may be argued ainst the reference about questions ind. Is it fair that questions about er meaning of drawings and specifi- should be included as one of the to be referred? Suppose, for ex- difference existed between dimen- ured in a drawing and those described pecification. Is a third party in a sition to decide? The contractor naturally thinks he is; the architect takes an opposite view. The dimensions may relate to the depth of concrete for foundations or to the thickness of a wall. The architect ought certainly to be the best judge of what is needed and what his intentions were; but he has no right to put the contractor to extra expense through his own fault in not clearly defining his intention. It appears to us that this is a point that ought to be settled between contractor and architect in each case at the beginning, so that a fairly-drawn arbitration clause should be inserted. There would be less litigation if it were so. As it is, a general arbitration clause is introduced relating to all matters in dispute, including any differences that may arise in reference to workmanship and materials, the meaning of drawings and specifications, claim for extras, certificates, and other matters. If the architect is arbitrator he must exercise his judgment in a reasonable manner, or his decision is likely to be called in question or be left to a jury, in which case the architect's opinion would be taken as that only of a witness for the employer. An appeal to an outside person is the course advocated by contractors, and is more desirable in large undertakings. It may be more reasonable to limit the architect's power to questions of materials and workmanship, and to interpretation of drawings and specifications, but to allow an appeal to be made by the contractor if he considers he is being severely dealt with, and on questions of prices to be allowed for extra works and deductions that have been sanctioned. Many of the arbitration clauses we have seen are framed in a manner which imply on the part of their framers, if we are to regard them as equitable persons, a very scrupulous accuracy in the documents prepared. Take, for example, the following clause in a form of combined specification and agreement adopted by the late Metropolitan Board of Works: "Should any discrepancies, however, appear, or should any misunderstanding arise as to the meaning or import of the said specification or drawings, or about the quality or dimensions of the materials, or the due and proper execution of the works, or as to the measurement or quality and valuation of the works executed under this contract, or as extras thereupon, deductions therefrom, or as to any other matter or thing whatsoever arising out of this contract, the same shall be explained by the engineer, and his explanation shall be final and binding upon the contractor; and the contractor is so to execute the work according to such explanation, and without charge or deduction to or from the contract." A following clause states that if anything necessary to the due performance of the works be omitted to be shown in the drawings or described in the specifications through oversight or error, the contractor is, notwithstanding, to execute in the most perfect and complete manner all such works without any extra claim or charge. Every question or matter is here referred to the engineer, whose decision is to be taken as binding. The effect of such a clause is obvious. The contractor takes care to protect himself from all liabilities that are likely to fall upom him, and to allow a good margin for extras, especially if he is aware of any imperfections and defects in the drawings and specification. On the whole, a moderate clause is more likely to meet with approval than one that is particularly stringent, and we are quite certain that among far-seeing contractors a large percentage is added upon contracts which are unreasonably severe in their requirements. We think, therefore, that a contractor should be permitted to appeal to a referee on completion of contract as to any increased cost to which he may have been put by the architect, whose directions he has obeyed under protest.

The question to which we have referred arises frequently whenever an extra is charged. The contractor claims as an extra whatever he does not find clearly described or indicated. If during the progress of a building it is found there is no mention of windows or doors, is it not reasonable to conclude that such things are absolutely necessary to complete a building? Surely the architect would have a right to decide that such things were intended or implied. So at least the law thinks, for in a certain case Mr. Baron Pollock decided that where no mention was made of flooring, the flooring of a house cannot be considered an extra any more than the doors or windows, as the contract said the house was to be made fit for habitation. Most contracts impliedly, therefore, give the architect power to determine what are extras under the contract, and his certificates are consequently conclusive; but if not, there are certain works implied in the rendering up of a building which cannot be left out, such as those to which we have referred. Many builders fall into the error of thinking that all work not specifically mentioned in the specification is excluded, whereas a certain sense of implication ought to be considered reasonable.

The "written order," as a condition-precedent to a claim for an extra, valuable as it is as a security against unnecessary cost, may be considerably reduced by a "waiver" of that condition. We have known the architect and employer to place implicit confidence in this condition of the contract, but the contractor has nevertheless carried out extra works from instructions given verbally by employer or architect—of course, relying on being paid. He finds, however, at the winding up of accounts that the architect demands the production of the written orders; a lawsuit follows, and a "waiver" is set up by the contractor. It may be difficult to determine what constitutes a waiver of the condition; but the Court may imply such a remission. If a thing absolutely necessary for the completion of the building is carried out and charged for without a written order, a Court would certainly believe a waiver established, especially if the extra works claimed for were outside the contract altogether, or became the subject-matter of a new contract. For example, it would be unjust to a contractor who followed the verbal instructions of an employer, and added another room or formed another cellar to a house, if the architect refused payment on the ground of the contractor not producing a written order. He may have been negligent in doing so, believing all the time that such instruction for additional work could not justifiably be disputed, or he may rely on the honesty of his employers. These irregularities in contracts are not always determined by provisions which can be proved to be severe or unnecessarily strict. The law places a reasonable construction upon them, or in their absence implies a condition.

Great strictness, therefore, in the drawing up of a contract, especially when it is on one side, will not be favourably viewed by a Court should any dispute be brought before it, and the idea of enforcing provisions that are unreasonable, or of making unfair contracts binding, is becoming less tenable. Judges and juries both look into the evidence and facts of each case, and if they think any provision or clause severe or unreasonable they relax it. On the other hand, if the contract is silent on any point, as, for example, the time of completion of a work, the law will imply a condition that shall appear reasonable. When, for example, there are circumstances which show that the completion of a contract work is of importance, and of the essence of the contract, as in the case of a railway under a special Act, the law will imply a condition. Strict rules of law are relaxed in Courts of Equity, so that contracts are now judged by an equitable construction rather than by strict

adherence to arbitrary stipulation. Architects and engineers, therefore, will do wisely to frame their conditions with moderation, and refer those points which are likely to be disputed to the arbitration of an independent referee.

HEAVY RAINFALLS AND BUILDING LEVELS.

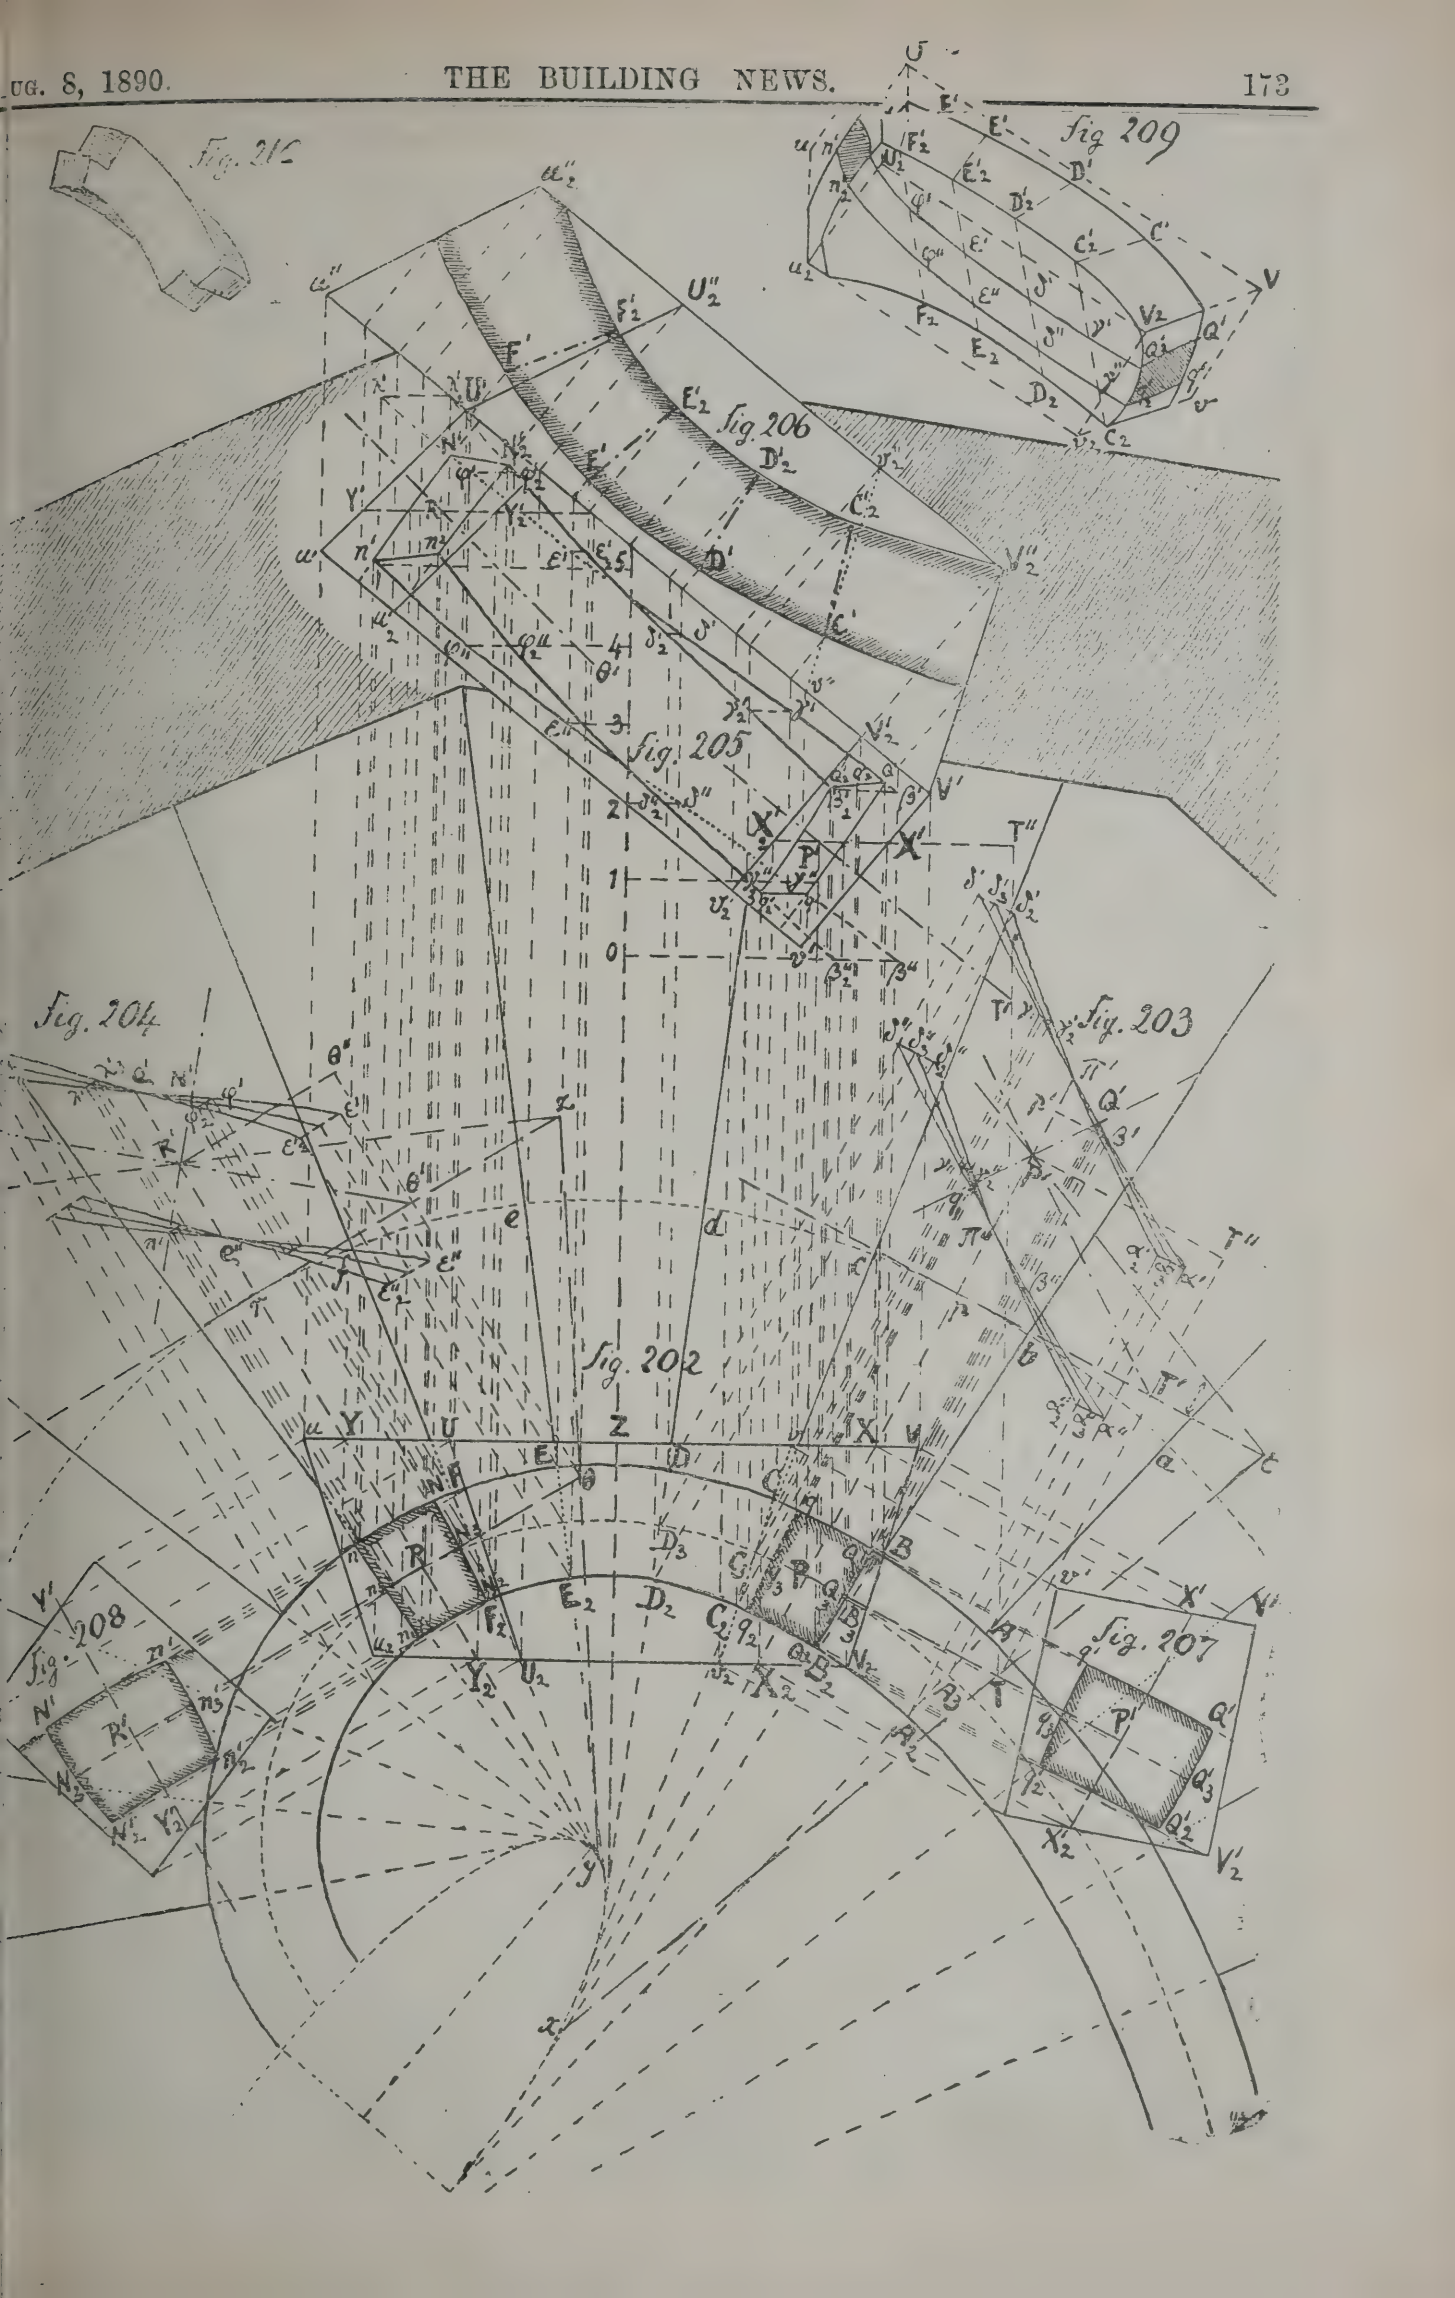
A LARGE amount of responsibility rests with the authorities for the recent damage to property by the recent floods. An exceptional storm like that experienced a few weeks ago in London, and the southern and western counties of England, does not come within the ordinary calculations of engineers in preparing plans for sewerage. If they allow a certain margin of capacity in their sewers for extraordinary rainfall, they may consider their duty fulfilled, and they might argue with some reason that to increase the cost of construction, and therefore to place an additional burden upon the overtaxed ratepayer, for an exceptional occurrence like a storm of extraordinary violence would be unjust, if not unnecessary. But, as a matter of fact, the requirements of the large areas now built over in the suburbs of London have been very inadequately met. Sewers and drains have been constructed at great expense which are quite inadequate to meet an ordinary heavy rainfall of short duration, and which are now fully taxed by the extension of buildings. It must be remembered that the areas of rainfall have changed of late years. What a few years ago were acres of pasture-land with a more or less permeable soil have become built over; roof and paved areas have taken the place of flat, porous ground, and the flow of water is necessarily quicker and the discharge greater in a given time. In many districts 1c.ft. per minute per acre is a large flood. A maximum flood at the outfall of a great river like that of the Severn at Gloucester has, indeed, measured as much as 2c.ft. per minute from every acre of drainage land. It is the sudden rain-storm of short duration that the local authorities have to consider, and that tax the resources of the sewers. Mr. Symons has remarked that in every year a fall of at least ½in. in 30 minutes takes place somewhere in England and Wales. An extraordinary rainfall lasting only a quarter of an hour will amount to an inch, or at the rate of 4in. per hour, and such a fall cannot run away in the usual order of things. The drains already filled cannot receive any portion of the surplus, which then becomes so much flood or inundation over a certain area. There is no provision made. The surplus, which floods the houses and basements of low-lying districts, is really surface water which cannot be discharged by the sewers for the time being. There are only two remedies. The first is to provide storm overflows or reservoirs wherever practicable; the second to make the sewers large enough to retain the surplus water till the storm abates. The last plan is costly; the former commends itself to our common sense. The storage or regulation reservoir should contain the difference between the quantity of flood water the river can carry off without overflowing and the quantity of actual rainfall. The regulating dam should be made high enough to hold the water till the rain-water subsided. In towns, the necessity of providing reservoirs underground is apparent, and house drains should be provided with tidal flaps to shut off the back flow.

Legislation has yet much to do to render these extreme falls of rain harmless. For instance, the local authorities having powers under the Public Health Act might make it compulsory to provide special channels and drains for flood water. Natural streams in valley lines may be deepened or rendered spacious enough. The sanitary authorities should also decline to sanction plans of buildings on sites on the margin of rivers which cannot be drained; on no account should the excavation for basements be permitted. In the Metropolis, *e.g.*, we have lately been made aware of the serious inconvenience suffered and injury to property and health inflicted by the pernicious practice of allowing low sites, often on excavated ground, to be built over. The lower stories are placed on the excavated level without any precautions as to drainage. Sometimes these basement floors are below the high-water level; the consequence is that when a heavy rainfall occurs the lower stories are completely inundated. No provision is made for chambers with valves at the outlets to prevent floods backwatering the sewers. A district below the level of high water or land floods ought to be cut off from the higher districts by these means; but we find they are not so. When an extreme rainfall occurs the upper system of sewers, overcharged from the surface water, blocks the lower system, or in most cases the water forces its way into the lower sewers and up the house drains, so that the occupants of the houses get not only the flood water but a dilution of sewage as well to put up with. Many portions of Dulwich, Brixton, and Kennington suffer from this more dangerous form of flooding, leading to various kinds of sickness. The suggestions published by Sir Robert Rawlinson, K.C.B., for the Local Government Board, some years ago proposed, and illustrated by plates of sections, modes of averting the dangers of floods, but we may ask why they have not been practically enforced. Surely the County Councils of London and other towns have the matter in their hands. They can at least obtain powers to compel every builder of new estates to place his basement floors above a certain level, which could easily be regulated by reference to any Ordnance datum map, and to prevent the construction of underground parlours below a given level, which are so common a provision in London houses. Many of these are yearly flooded with diluted sewage and surface water, which, as it subsides, leaves behind it a filthy sediment or slime which gives out an unpleasant smell. During the late heavy storm, we know of several living rooms below the ground floor in which the water rose three to four feet high in the course of half an hour, causing the inmates to beat a hasty retreat to the upper floor. Tables, chairs, sideboards, and pianos were in some cases under water before they could be removed, and the underground stores of many houses of trade have been completely damaged. The question of basement floor levels ought by this time to have been dealt with effectually by sanitary authorities. We have by-laws requiring the sites and foundations of new buildings to be erected on solid ground and any refuse removed, the foundations to be formed of concrete, and the area covered with a layer of the same 6in. thick; another section provides that the lowest floor of every building shall be laid at such a level as will allow it to be properly drained; another requires cellars and underground rooms to have certain provisions if occupied as dwellings as regards area for light and ventilation; but, strange to say, not one of the regulations prevent a basement floor being placed so low as to be flooded at any conjunction of high tide and heavy rain. All the rules for controlling foundations and drains are useless if a floor is placed too low to be adequately drained; but such in fact is the actual and imperfect legislation that exists. It would be very easy to define the level of the lowest floor of every new building, and making it a by-law; but in many of the estates built over in districts that lie low, like parts of Wandsworth and Battersea, the cost of raising the ground or the found and walls would have been costly. W here the secret of the matter; the g would have been lying idle if such a r tion had been made. Surely, howev cost of rendering such sites healthy more importance to the community, would be better that they should r unbuilt over than that thousands poorer tenants of those localities suffer all the inconveniences of dan uninhabitable dwellings. The definit level of lower rooms certainly shou included in any amendment of b regulations.

MASONRY AND STONE-CUTTI

By Lawrence Harvey.

[THIRTY-FIRST LESSON.]



STRING OF GEOMETRICAL STAIRS.

LET (Fig. 202) the spiral *a b c d e f*. the treading line which best suits th of a certain staircase, and let it be div equal lengths equal to the widths of the let *a* A, *b* B, *c* C . . . the arrises of the be normal to the treading line, and let A be the inner line of the string in which t are housed, each point of which is take equal distance from the treading line. No two curves, the treading line and the c the string, have the same involute v formed by the series of points where the to the treading line meet one another. case, the involute is an ellipse. Takin $B B_2, C C_2, \ldots$: all equal to the width to to the string, the string will then be co between two vertical cylinders, which base the parallel curves A B C D E . $A_2 B_2 C_2 D_2 E_2 \ldots$ As to the up lower faces of the string, they are tw surfaces identical with that of th of the stairs. The directing hel these surfaces are drawn on the c which has for base the treading - l upper one slightly above the arr the steps, and the lower one slightly b soffit of the steps. The generators of th faces will also be projected on A A_2, B I . . . The string is divided in a certain of stones, and the joints are to be plane to the centre curve supposed to be drawn the stone. This central curve is the inte of the cylinder $A_2 B_2 C_2 D_2 \ldots$ equidista the sides of the string, with a skew surfa distant from the upper and lower face string.

Let P be the horizontal projection of on the centre curve through which the the joint is to pass. After drawing the g p P x, select a vertical plane of proje perpendicular to the generator p P generator will be projected thereon in o point P′ (Fig. 203), which place at th two risers; then take the distances P′ equal to half the height of the string. triangle P′p t carry the length of arc p base p t from the angle t, then produ tical until it cuts the side P′t, a the length of that vertical from π' to horizontal p' β' will be at the level generator B B_2 of the upper surface of th and therefore it is the elevation of that g Then draw at distances equal to the ris horizontals, $a' a'_2, \gamma' \gamma'_2, \delta' \delta'_2$; these are t tions of the generators A A_2, B B_2, C C_2, of the upper surface of the string. horizontal generators mark the elevatio points A_1, A_2, A_3, and B_1, B_2, B_3, w generators meet the lateral faces of t and the cylinder on which is placed t line; this gives the three curves a' $a'_2 \beta'_2 \pi' \gamma'_2 \delta'_2$, $a'_3 \beta'_3 \pi' \gamma'_3 \delta'_3$, which are the upper face of the string. Those of face, $a'' \beta'' \pi'' \gamma'' \delta''$, $a''_2 \pi'' \delta''_2$, $a''_3 \pi'' \delta''_3$, a by carrying on each vertical a distance a'

Now we have to find the plane tang skew surface, which follows the cent the string. Draw first tangent P′ t to t ing helix, and to do this take pt = then by sliding the generator (p P x, tangent and on the vertical x a connect boloid is formed, of which the horizo another generator. If, therefore, th plane P T (Fig. 202) is produced per

Fig. 202
Fig. 208
Fig. 207

to line P x, this plane will cut the paraboloid along the line (P T, P′ T′) which defines the tangent plane P′ T′ T″, and is also the tangent to the centre curve of the string. The plane of the joint, which must be normal to the centre curve, will have for vertical trace Q′ P′ q' perpendicular to P′ T′; projecting on the bases of the three cylinders A B C, $A_2B_2C_2$, $A_3B_3C_3$, the points where the trace Q′ P′ q' meets the upper and lower curves of the string, the horizontal projection Q Q_3 Q_2 q_2 q_3 q of the outline of the joint is obtained.

Let R be another point on the centre curve through which the plane of the other joint is to pass; after taking (Fig. 204) a vertical projection plane $r z$ perpendicular to the generator R y, and projecting thereon the generator on one point R′ at the level of two risers above the ground line, mark the height $\rho'\rho''$ of the string equal to that adopted in Fig. 203, and construct the upper and lower curves of the string near the point (R R′); then draw the tangent R′z of the guiding helix, and deduce therefrom the tangent (R′ θ', R θ) of the central curve of the string, and the normal joint plane N′ R′ n'. Lastly project on the bases of the three cylinders the points where the trace N′ R′ n' meets the curves of the string and the horizontal projection N N_3 N_2 n_2 n_3 n of the joint is obtained.

By the former projections the shape of the string-stone is fully determined: it remains to project the entire stone on one single plane. Draw (Fig. 202) two vertical parallel planes X Y, X_2 Y_2, containing the horizontal projection of the stone; then project the stone on the plane X Y. To do this, mark on vertical Z the divisions 0, 1, 2, 3. . . . equal to the heights of the risers (Fig. 205); then taking through these divisions horizontal lines, and projecting thereon the points B and B_2, C and C_2, D and D_2. . . . draw the curves

$$\beta'' \gamma'' \delta'' \varepsilon'' \phi'' \lambda'' \text{ and } \beta''_2 \gamma''_2 \delta''_2 \varepsilon''_2 \phi''_2 \lambda''_2,$$

which limit the lower face of the string. Those of the upper face will be deduced from the former by prolonging each vertical by a length $\beta'' \beta'$ equal to the length $\pi' \pi''$ in Fig. 203.

The point P′ (Fig. 205) is on the vertical erected from P, and it is at a level below β' β'_2, equal to P′ p' of Fig. 203. Project the point T in T″ on the horizontal P′ T″ of Fig. 205, take T″ T′ equal to the length of same designation in Fig. 203, the line P′ T′ will be the projection of the tangent to the central curve of the string. Then project in X′, X'_2 on the horizontal P′ T″ the points X and X_2 where the medium line of the joint projected in X P X_2 cuts the vertical planes X Y and X_2 Y_2, and draw through these points X′ and X'_2 (Fig. 205) two perpendiculars to the tangent P′ T′. This will give the intersections of the side faces of the operation-stone with the plane of the joint. The operation-stone is limited above and below by the parallel planes U′ V′ and u' v' perpendicular to the vertical face X Y, and comprising between them the elevation of the stone. Now, to obtain the curves of intersection of the joint plane with the four faces of the string, project the points Q and Q_2, q and q_2, on the upper and lower curves to which they belong; the mid-point Q_3 must be projected at a level above β' β'_2 which is shown in Fig. 203, and it will be the same for q_3; then, the mid-points of the lateral curves Qq, Q_2 q_2, will be on the horizontal X′ X'_2, and through all these points the curved outlines of the intersection can be drawn.

The same operations will have to be done for the joint passing through the point (R, R′) in taking Fig. 204 all the differences of level from the horizontal ϕ' ϕ'_2; to define the plane of the joint, the perpendiculars to the tangent R′ θ' shall be taken through the points Y′ and Y'_2 (Fig. 205) deduced from Y and Y_2 on plan (Fig. 202). The operation-stone, after the joint planes are worked, is reduced to a prism, the ends of which are oblique planes.

Fig. 206 represents the intersection of the upper face V′ V′ of the stone with the vertical cylinder B C D E F L and B_2 C_2 D_2 E_2 F_2 L_2. To obtain these curves, prolong the verticals Cγ', $C_2\gamma'_2$, Dδ', $D_2\delta'$ $D_2\delta_2$, . . . until they meet the line U′ V′, and turning down that face round the lines U′ V′ the points will come to C′, C'_2, D′, D'_2, . . . at the same distance from U′ V′ as C, C_2, D, D_2 from the line U V on plan.

The intersections of the lower face u' v' are identical with those of the upper, and, therefore, the plane u' v' is supposed to be raised to the level of the upper plane, and the traces of the cylinders already drawn serve for both planes.

On Fig. 207 is represented the head-mould of the operation prism, intersected by the faces of the string; it is a projection with X X_2 as ground line. To produce this, take on line P P′ a point P′, draw through it a parallel to the ground line X′ P′ X'_2, from which carry the differences of level of the various points taken from Fig. 203.

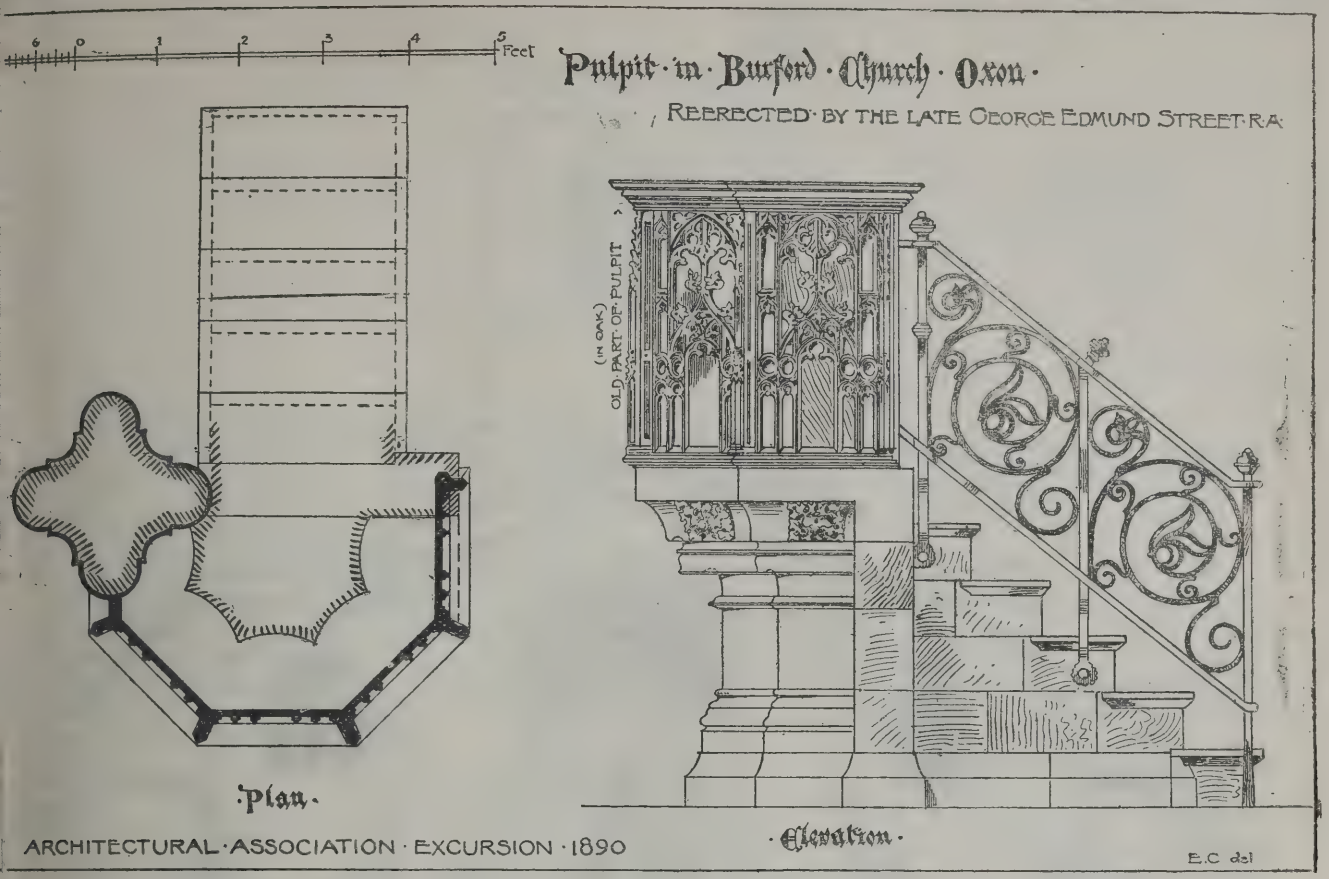
On Fig. 208 the head-mould of the other joint has been drawn by the same process.

Application of the Lines on the Stone (Fig. 209).—Work first the prism, of which dimensions are given, Fig. 202 and Fig. 205; on the upper and lower faces place the moulds given in Fig. 206, then work the end joints V V_2 v_2 v and U U_2 u_2 u. After this, work the concave cyclinder by means of the curves $C_2D_2E_2F_2$ and $C'_2D'_2E'_2F'_2$, laying on these curves a straight-edge through the points C_2 and C'_2, D_2 and D'_2; then work likewise the convex cylinder. Now, on each generator of these cylinders carry the lengths $C_2\gamma''$ and $C_2\gamma'$, $D_2\delta''$, and $D_2\delta'$, measured from Fig. 205, and with the help of a flexible straight-edge, draw on the concavity of the cylinder the curves $\gamma''\delta''\varepsilon''\varphi''$, $\gamma'\delta'\varepsilon'\varphi'$; draw likewise the curves of the string on the convex cylinder. Then the upper and lower faces of the string can be worked with a straight-edge laid on the level points $\gamma'\gamma'_2$, $\delta'\delta'_2\gamma''\gamma''_2$.

Sometimes the joints of the string have elbows, as in Fig. 210; but it is easier to have a joint in one plane and connect the stones by dowels.

On the convex side of the string the outline of the steps must be drawn, by means of a development, and must be cut in about ½in., in order to house the ends of the steps in the string.

A marble handrail would be worked exactly in the same way as the string; first with a rectangular section, then the mouldings would be cut out from this operation helix by means of templets.



ARCHITECTURAL ASSOCIATION: EXCURSION INTO OXFORDSHIRE.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

ON Monday next the annual excursion of the Architectural Association will commence the proceedings by visiting several of the colleges and churches in Oxford, and during the week the chief buildings in the south part of the country will be seen, in accordance with the programme which we printed in our issue for July 25 last. We give to-day some drawings from Burford, showing the grand church and the unique Priory chapel in the nave, as well as the undercroft to London House, in the High-street, of the same village. The latter illustration is from a sketch by Mr. W. A. Pite, and the geometrical drawings are reproduced from the original plans of the late Mr. G. E. Street, R.A., who restored the church. We are indebted to Mr. A. E. Street, M.A., for their loan on this occasion. Some few years since, when visiting Burford, we made some sketches there (see BUILDING NEWS, September 25, 1885, for drawings of the Priory and of ruined chapel attached), and to-day we publish one of these studies, giving a view of the great porch with the fine parvise over it, the central tower and south transept, showing to the end of the Burgess transept, and part of the Bartholomew aisle, with one bay of the Sylvester aisle to the left of the fore-part of the picture. In finishing our sketch we have been assisted in its details by some photographs taken on the same occasion by Mr. John L. Robinson, A.R.H.A., of Dublin. Several of the old houses in Burford were represented in a double-page sheet of illustrations which we published in the BUILDING NEWS for August 7, 1885, from pencil studies, also by Mr. Pite, on the eve of the Architectural Association excursion to Banbury and north-west Oxfordshire. These were followed by a series illustrating places then visited.* At that time we made a copy of the late Mr. Street's report on Burford Church, dated March 23, 1870, and we are thus enabled to accompany our illustrations to-day with his most interesting description, which has never before been published. It runs as follows, and was addressed to the Rev. J. H. Burgess, the vicar:—

"In sending you the plans and specifications for the restoration of your magnificent parish church at Burford, I am anxious to explain some of their principal features; as, unfortunately, I find it will be impossible to do so by word of mouth at your meeting on the 29th. I must begin by saying that there is in my opini church in the whole diocese of Oxford exceeds it in beauty and architectural interes is not only that in scale it is grander tha other parish church, but also that in its arc tural detail it is singularly rich and beautiful Oxfordshire, where we still see such churc those of Bampton, Witney and Bloxham, i slight thing to say that Burford is on the more interesting than any of them, and it fortunately at a disadvantage in comparison ing that they have been restored whilst it calls still for restoration. And here I wish in a few words what I mean by the use word 'restoration' in connection with building. I wish, as far as I am concern confine the work which I shall do in it, most rigorous manner, to preserve the solid and exhibiting it with as little alteratio addition as possible of any feature which all conjectural. I do not at all agree church restorers who allow their work to all over the face of an old building. stonework is only slightly damaged or imp no good is done by patching or renovati Where old features have in part disappea *e.g.*, the pinnacles of your south porch and aisle, it is wise to restore them, because exist which show exactly what they ori were. And again in the western gable, of the niche and pinnacle on the apex rem make it no difficult task to design its comp But cutting out only slightly damaged st order to put perfect stones in their place, cl and redressing old stones which have o face the weather stains of age, or allowing work to be cleaned of whitewash with a tool in such a way as to alter the old face stone and its mouldings, is to destroy the value of the building as a record of the art a tory of the past. My object will be to alter old, but simply to show it to as much advan I can by repairing it where repair can avoided, and removing modern additio excrescences which conceal and dimin beauties. Fortunately, there are few chu which, thanks to the excellence of the m there is less difficulty in carrying out a rest in this spirit than Burford church. And its shape undoubtedly presents great diff in the way of good arrangement, they ap me such as may be overcome if I am all deal boldly and at the same time sensibl such arrangements. Let us now explain t in which I propose to arrange the inte worship. This is no doubt a great difficu it was one which was met in the best way 15th century, and I propose simply to fol example then set. And here I must prem the present very singular ground plan church is not merely ordinarily irregu difficult to deal with. Its present shap fact, the result of joining together of two distinct buildings, one of them even bef having been very irregular in its plan. no doubt that, originally what is now ca Sylvester aisle was a chapel standing detached from the church. It was founde 13th century, and was not joined to the by the opening of arches in the north w the 15th century, when it was also leng eastward. The result is that your mag porch, one of the finest works of its kind in England, which was at first partly deta now completely imbedded between this cha the western of the two south transepts. time this was done I believe that the inconvenience of the narrow arches un central tower was pressing itself on the mind. Services were probably becomin popular, and it was found to be necessary it is now to make the church available for congregation assembled at one time at one It was found that the altar at the east en chancel was so far off and so cut off f church by the low tower arches, that as f congregation in the nave were concerned almost have well been another building. it was desired to remedy this state of t most ingenious plan was devised, to whic pose again to have recourse, and of which of no other example. This was the erect chapel with an altar under the eastern ar north arcade of the nave, surrounded by work and covered with a canopy or teste most interesting to observe that from th more people are seen than from any oth in the church. It is a spot so ingeniously that the double row of columns betw

* BUILDING NEWS, Aug. 14 and 21, 1885.

ter aisle and the nave presents hardly any ction, falling as they do one behind the if lines are drawn from the point of the towards the south-west. And it is very s that so much of this rare arrangement l still be preserved intact. It has, I believe, een known as the Priory Pew, but here in ew, with its canopied ceiling, I have no we have the 15th-century people's altar of rd. And it seems to me, as I hope it will rford people of the present day, that the ation of the altar in this chapel is the on-sense solution of the greatest difficulty exists in regard to the restoration of the n. I should, of course, not propose to move ar from the chancel, but I think it might e used for service at which none but Com-ants are present, such as early celebrations y Communion, whilst for the midday ser-n Sundays and great Festivals an altar in iory chapel might be used, so as to allow service being joined in thoroughly by the of the congregation in the western part of n. As regards the position of the choir I am inclined to recommend that their old in the chancel should be retained. In cases I have found that singing is per-well heard all over the church from such a n, and as far as I could ascertain the effect eriment, I did so when I was at Burford, th satisfactory results. The Bartholomew would afford a very good position for the near the choir, and where space would of value for congregational services. I e to seat the church generally with simple seats, but under the tower and in the o use chairs. The tower arches confine ce so much that it would not be easy to xed seats here, and chairs have the advan-being easily movable, so that people may em to the pulpit or the altar according to ish. For the same reason that dictated n for the people's altar, I would place the against the second column from the east north side of the nave. From this point ole of the nave, most of the Sylvester he south transept, and the space under the s well commanded."

rest of the report concerns heating the Mr. Street also advises the opening up of tern in the central tower into the church. rare feature in Romanesque work. The l was re-roofed and the ancient altar was ted by Mr. Street, who restored the chapel, its stone altar and dossal. He also beautifully redecorated it, setting out part of the ornamentations himself on the spot. Since the death of Mr. Street, Mr. Sedding has done one or two minor works of restoration, about four years ago. The plan printed with our sketch herewith explains the remarks in Mr. Street's report. It is a copy of the plan he had made from careful measurements.

Below the south aisle of the church there is an interesting undercroft, which was formerly used as a mortuary chapel, and forms above a sort of raised gallery as indicated by the plan. Similar instances of undercrofts exist at St. Mary's, Witney, and Dorchester Abbey.

Next week we shall give an illustrated report of the Excursion proceedings.

ST. MARY'S CHURCH, LONG CRENDON, BUCKS.

By Frederick George Lee, D.D., F.S.A.

LONG CRENDON, situated on a hill two miles north of the town of Thame, Oxon, is notable for its long and varying chief street, more than half a mile in length; for the picturesque character of several of its old houses, though many of these, of late years, have been either destroyed, re-faced, or mauled; for the ancient but altered Tudor manor-house at its extreme west end, as well as for a still earlier building, known as "Staple Hall"—of which a sketch is provided—adjoining the parish church, at the extreme east end and upper part of the village.* For Crendon is now only a village, though anciently it was a market town,† the centre of a large wool trade, and a place of considerable importance.

The chief building remaining is, of course, the church, occupying a remarkably prominent position, close to the long-destroyed castle of the Giffards,‡ and commanding a beautiful view over Crendon Park. Like most other churches, it has suffered from neglect, bad restoration in previous periods, local prejudice and parsimony, indifference, and loss of church-rates. But its recent restoration—undertaken last year—is an abiding credit to all those who so successfully combined to effect the same.

There is no space in which to trace the history of the manors of Crendon—a history somewhat tangled and confused. The abbots of Notley owned a moiety, and so did Sir John Dormer, descended from the family of the same name, of West Wycombe and Thame. Sir John, as his predecessor had done, made a large fortune as a wool merchant of the Staple of Calais—"Staple Hall," in Crendon, remains as depicted. Mr. Dodwell, of the Manor House, is one of the Lords of Crendon; while All Souls' College, Oxford, possesses likewise ancient manorial rights.

The church, dedicated to God in honour of the Blessed Virgin, is cruciform in plan, with porches, having stone sediles, on the north, south, and west sides. It consists of nave, with north and south aisles, choir, north and south transepts—each of these latter being entered from the aisles, as well as from under the tower.

The central tower, itself of three stages, with a sexagonal turret for stairs at its north-west corner, is embattled, massive, and well-proportioned, and has Late Second-Pointed, or perhaps very Early Third-Pointed, windows in its belfry; other windows, having angle-headed hood-mouldings,* on the belfry stage below.

The extended view from the top of this tower is almost unsurpassed for diversity, range, and beauty. Though Buckinghamshire lacks the wild mountain scenery of Devonshire, Derbyshire, and Cumberland, yet for pastoral variety, including the beautiful Chiltern Hills, and their beechen woods, it is in parts unsurpassed. The greater part of the whole range of the hills in question, the rich vale of Aylesbury, the two Kymbles, *Magna* and *Parva*, near Hampden House, and the Mansion of Chequers, near Velvet Lawn, together with the Hill of Whitchurch, the woods of West Wycomb, the broad valley in which Oxford lies, the Wittingham Clumps, and the Berkshire Vale of the White Horse, can be

* "Staple Hall" was, no doubt, originally a mansion of the Dormers of Thame and Crendon. The lower part, on the left-hand of the sketch, is the hall; that part to the right, recessed, is the kitchen, pantry, and bakehouse. The hall on the upper floor is long and capacious, in which packs of wool were kept. The late Mr. J. H. Parker, C.B., of Oxford, held that the building was considerably older than the period of Henry VII. It has been much altered of late years.

† A market had been granted, A.D. 1218, to William Earl Marshall, a benefactor of Notley Abbey.

‡ Walter Giffard, Lord of Longueville, in Normandy, came over with the Conqueror, and obtained the Earldom of Buckingham. He built a castle at Crendon, and was lord of the place. Walter Giffard, his son, died in 1102; a second Walter died in 1164. (Arms: gules, three lions passant, argent, armed and langued azure.)

* There is an Early English window, *circa* 1220, at Uffington, co. Berks, of the same angular form; but, of course, the tracery differs, the Crendon windows being of a later date.

all distinguished on a fine day from the tower of Crendon Church.

Originally the sacred edifice was built in the Early English or First-Pointed style, many traces of which, more especially in the chancel and north transept, still remain. The lancet windows on each side of the former are very simple and of excellent proportions, with plain but effective internal hood mouldings, terminating in carved heads and ornaments. The east window, of old, consisted of three lancets, deeply recessed, and with internal detached pillars of Purbeck marble, and handsome capitals and bases; but these, having gone to decay, were removed in the last century, as tradition asserts since 1740, and a domestic window, with wooden transoms, inserted. This latter has been recently removed; while, in its place, a Second-Pointed rose window has been inserted, after a beautiful early type remaining in the north wall of the north transept.* The east window of the choir has been recently filled with stained glass by Mayer, of Munich and Bond-street, at the cost of Mr. Herbert Dodwell, of Croft House†, in memory of his mother. This window contains the following subjects, beginning with the north light: The Birth of Our Lord, His Baptism, the Crucifixion (in the central light), the Women at the Tomb on Easter morning, and the Ascension. In the centre of the rose above is an *Agnus Dei*, with adoring angels and archaic flowers. It is, perhaps, on the whole, somewhat heavy in colour, wanting more white glass; but the tints of it are rich and mellow, while the design on the whole is good and effective. It is, however, decidedly of a German, rather than of an English, type.

The original well-conceived ground-plan of the church appears to have been adapted in all the various changes which have been made since the church's first foundation. The north transept was altered by some Second-Pointed work, as was the north aisle. The south aisle is mainly Early Third-Pointed, as are parts of the nave. The windows throughout the church are generally good; those in the south transept, however, where the vault of the Dormer family remains, with an elaborate and splendid monument of Jacobean work, being of Debased Perpendicular.

The great lack in the building is a clerestory, with good clerestory windows. Such being wanting, the internal effect, though marvellously improved by the recent conservative and judicious restoration, under the advice of Sir A. Blomfield, A.R.A., is perhaps still a little disappointing. By it, and because of it, however, the church is marvellously improved.

Up to the year 1835 there remained an excellent and almost perfect Third-Pointed oaken rood-screen (the loft and rood having been destroyed under King Edward VI.); but this was taken down, its panels having been made use of to inclose a lay-rector's pew on the south side of the chancel. This pew, however, has since been removed.

The tower in times past, *circa* 1626, was found to be somewhat unsafe, so its pillars were strengthened and recased, while the transept arch into the south aisle was blocked up, so as to form a buttress to the western side of the tower.

The level of the nave was raised about the same time. Under the recent restoration, however, the ancient levels have been again secured, for the bases of some of the pillars were hidden.

The freestone font, of a deep and rich yellow tint at the west end of the south aisle, forming a baptistery, is handsomely carved, and of an Early Third-Pointed character. Heads of saints and angels are represented in a series of sunken quatrefoils round its capacious bowl, while its base are four sculptured lions seated vine-leaves. Its oaken cover is modern, after a poor Jacobean model.

There is an Early English *piscina* in the wall of the chancel, of simple design, with shelf for the crewets above, and two curio minations of hood mouldings, quaintly c There is likewise a low stone sedile on both of the sanctuary for the attendants at the The arrangements of the east end are decen the general effect of the sanctuary very fai

A Second-Pointed, crocketed, and ca tabernacle* in the north wall of the north a portion which originally formed part Lady-chapel; for the Lady-altar, is belie have stood against a screen at the east this aisle—is effective and fairly well pres It contained an image of the B.V.M. a Holy Child prior to the Tudor changes, they were destroyed.

Here, too, was a plain rectangular I Window, the outline of which may, from the church, be still very distinctly traced. now filled up with stones.

The destruction wrought in Crendon Ch two notable periods of its history was som remarkable. Under Edward VI. and Eliz the sacred building was cleared out of alm its ancient furniture, altars, plate, pi hangings, and sculpture. When the Commissioners (headed by Sir Edmund Pe and Francis, Lord Russell) were found confiscating and removing its movable co certain of the chief people then living parish, in order not to allow all the pa *ornamenta* to be unjustly confiscated, too to help themselves, and did so unrebuked. Hart, of Brill—a village adjoining—a Ca has left on record how this popular po plunder succeeded; while, during the subs Rebellion of the next century, as Crend

* Anciently—as Browne Willis, the Bucks antiquary, has put on record—the lower parts of this north transept window contained armorial shields with badges and rebuses of the founder, various benefactors, and abbots and officers of the adjacent abbey of Notley in Crendon Park. But of these shields not a fragment nor trace now remains.

† In this house, at the west end of the village, parts of which appear to be as old as the time of Henry VI., but which has been sorely and badly undermined, divided, and broken up resided Sir James Croft (Comptroller of the Household of Queen Elizabeth), who became the third husband of Lady Williams of Thame. This lady was the fourth daughter of Thomas, Lord Wentworth, by Margaret, daughter of Sir Adrian Fortescue of Salden, Co. Bucks, Knt.

* There is an almost similar tabernacle at Kid Oxon, *circa* 1450, and another at Handborough same county, of precisely the same type, but o date.

lace of strategical importance, situated between ford, Thame, and Aylesbury (the very centre the struggle between Monarch and a warlike tion for several years)—it suffered most erely by destruction, tumults, military exac- ns, and social and material devastation.

The late Sir John Aubrey, Bart., informed Rev. Samuel Lysons, the author and well- wn antiquary, that Crendon had not recovered former and great prosperity, even far into the gn of Queen Anne. "Whole families were ned by requisitions, and by the fact that for rs the land remained uncultivated." The urch for more than two years had been used a receptacle for food for the Cromwellite liers; and their provisions and "horse-meat," well as the horses themselves, were for some e sheltered there. The church tower appears ave been made use of for military operations observation.

The population of the place—very considerable en the Abbey of Notley was flourishing*—is l to have been reduced to 785 in Queen Anne's gn. In the year 1810, a century later, it od at 989; now it has increased to 1179. For year 1776 the cost of maintaining the poor exactly £208 12s., whereas now the annual rges, as I learn with surprise, amount to e than £2,000.

The monument to Sir John and Lady Dormer, he south part of the south transept, is a very orate specimen of Jacobean work. There are recumbent figures, lying facing eastwards, on altar-tomb, under a deep, semicircular canopy, rned in accordance with the taste of the period question. Sir John Dormer is styled "of ton"; his lady was "one of the daughters ohn Gyffard, of Chillington." She died the Sept., 1605; he on the 11th of March, 1626. onderous oak screen separates this transept— w used as a vestry—from the church.

There are a few other monuments remaining, ple slabs, but of no particular character nor rest. Amongst these are stones to the nory of William Langbaine, of Queens' Col- e, Oxford; to members of the old races of non, Burnham, Stone, Warner, Winter, and rs. There are also two memorial brass res, but these are very much worn and ilated.† At the opening of the ground in nave several years ago, for purposes of inter- t, the body of a monk of Notley, sewn up in folds of stout leather, was discovered much decayed. But the bones are said to have been perfect, the cowl almost complete, and the beads and cross of a boxwood rosary were found undecayed by the side of the skeleton. It was found in a brick grave vaulted.

The following is a list, taken from the registers, old wills, and other deeds and documents, of the Perpetual Curates and Vicars of Crendon:—

	A.D.
William Walker	1517—1525
John Thame	1530—1534
James Hunt	1534—1536
Bartholomew Green	1536—1538
Valentine Bownd	1538—1550
James Chernock	1550—1557
John Trulove	1558—1564
Edmund Osborne	1565—1611
Francis Lee	1612—1628
William Crouch	[?] —1650
William Jeamson	1656—1666
Edward Goode	1667—1671
William Yates	1673— [?]
Thomas Yates	1680— [?]
Thomas Middleton	1682—1693
William Clerke	1693—1721
James Fynes	1722— [?]
Harry Cole	[?] — —
William Bertie	1729— [?]
John Newborough	1747—1783
William Newborough	[?] — —
John Holland	1795— [?]
Thomas Hayton	1823—1887
Frederick E. Ogden	1888— —

The two last have been styled "Vicars."

It is traditionally asserted that the five bells of Notley Abbey, about the year 1540, were, at its dissolution or soon afterwards, transferred to the tower of Crendon Church. The tenor bell of that peal is said to have originally weighed two tons. In 1632 three bells were added at Crendon to make up a peal of eight.* In 1768 the whole of these were re cast by Lester and Packe, of London, now a most excellent and truly melodious peal.

The following inscriptions occur on the bells:

Treble—	Although I am but light and small, I will be heard above you all.
2nd Bell—	Although but small, our tones are good.
3rd—	Peace and good neighbourhood.
4th—	Music is medicine to the mind.
5th—	Our voices shall, with joyous sound. Make hills and valleys echo round.
6th—	To honour both of God and King, Our voices shall in concert ring.
7th—	Ye ringers all That prize your happiness, Be sober, merry, wise, And you'll the same posses.
Tenor—	In wedlock bands, All ye who join with hands, Your hearts unite; So shall our tuneful tongues Combine to laud the nuptial rite.

The recent restoration, under Sir Arthur Blomfield, mainly confined to the nave and aisles, in which the roofs and floors have been well restored, enables the spectator to appreciate the dignified character of the venerable building, with its fine ground-plan and excellent proportions. Galleries, deal pews, and lumbering reading-desk have been one and all swept away; so that the interior now presents an appearance the very opposite to that which it bore before the restoration: thus affording a good and trustworthy idea of its original character.

CHIPS.

The extensive premises of Mr. W. Sayer, 86, New Kent-road, were destroyed by fire on Tuesday morning. A long range of timber and brick sheds, used as workshops and stores, were burnt to the ground, together with their contents.

The Theatre Royal at Glasgow was reopened on Monday, after partial reconstruction, from plans by Mr. C. J. Phipps, F.S.A. The roof has been lowered 7ft., and the gallery and upper circle a similar space, and by the removal of the boxes at each end of the upper circle this part of the house has been brought into horseshoe form. Behind the dress circle the boxes have also been removed, and the space transformed into a family circle. There has likewise been an augmentation of the rows in the orchestral stalls, and the entire theatre, which will now hold 2,600 people, has been redecorated.

The committee of the Institution for the Blind at Plymouth have adopted plans by Mr. Snell, of that town, for the enlargement of that building by the addition of a wing. The exterior will be two stories in height, and will consist on the ground floor of a workshop 60ft. by 20ft., and above this is a dormitory for 20 beds.

The County Council of Staffordshire have referred to a committee the question of providing a council-hall and offices with powers to obtain plans from architects for submission to the Council.

On Wednesday week memorial stones of a new schoolroom for the United Methodist Free Church, Hightown, Crewe, were laid. The plans have been prepared by Mr. Geo. E. Bolshaw, of Lord-street, Southport, and the school is being built by Mr. A. P. Cotterill, of Crewe. The cost is estimated at £1,300.

† There were no less than "six hundred houselling [illegible]"—that is, those who received the Communion—in [illegible] ear 1517.

Mr. Haines, in his valuable "Manual of Brasses," [illegible] the following: "John Canon, 1460, and with Agnes, [illegible] with 3 sons and 8 daughters, Nave, Long Crendon." [illegible]ondon and Oxford: 1861.

* Some of my readers may be glad to learn that a volume on the "Bells of Buckinghamshire" has been completed by a very competent hand, that of Mr. Heneage Cocks, of Great Marlow; and that the book is likely to be published during the ensuing season.

NEW PUBLISHING AND PRINTING OFFICES FOR THE PROPRIETORS OF "THE QUEEN," "THE FIELD," AND "THE LAW TIMES" NEWSPAPERS.

This building has been erected by Messrs. Dove Bros. from the designs and under the superintendence of Messrs. Satchell and Edwards, architects, who, without indulging in costly details, appear to have aimed at producing a constructionally sound substantial edifice, well lighted throughout, and practically suitable for its special requirements. The 200ft. frontage is of Portland stone and red Fareham bricks, the two lower stories being entirely of the former material, massively treated as an arcaded basement, the two side elevations being arranged to harmonise with the front. The slightly projecting wings at either end are surmounted by cupolas covered with lead. The basement contains a boiler-house fitted with two of Galloway's boilers, an engine-house with one pair of horizontal engines 125 indicated H.P. for electric lighting, two beam-engines 80H.P. each, machine printing-room, 110ft. by 49ft., being 32ft. high in the centre and 20ft. at the sides, covered with an iron glazed roof; folders' room, 77ft. by 25ft.; an insetting-room, 47ft. by 27ft.; Mr. Wood's (the engineer) room, an engineer's workshop, a roller-room, a paper-store, 38ft. by 38ft; a mess-room with kitchen adjoining. The ground floor consists of a large room, 50ft. by 19ft., at present unappropriated; the publishing offices—viz., for *The Queen* and *The Field*, 38ft. by 27ft.; for *The Law Times*, 27ft. by 25ft.; office for advertisements, 27ft. by 26ft.; and the "Early Publishing Department," 47ft. by 27ft. A covered roadway leads from the street by the side of the latter department (for loading vans) to the rear of the premises. The principal handsome staircase, with a waiting-room at the foot of same, conducts to the well-lighted arcade corridor on the first floor, which extends almost the entire length of the building, and leading from which is Mr. Horace Cox's room, with his secretary in the adjoining apartment. There are eleven editors' rooms, also a waiting-room, attendant boys' room, and a library. The second floor contains a room 130ft. by 30ft., and one leading out of same 32ft. by 25ft., capable of accommodating 150 compositors; these rooms are faced with white and red glazed bricks, and lighted on both sides by a succession of windows. Mr. Phillips' room and his clerk has also store-rooms. The third floor affords similar accommodation to the second floor, and is also lighted by top skylights, having a foundry and seven readers' rooms, store-rooms, and kitchen. The roof, with a photographic room thereon, is constructed as a fireproof flat, covered with Claridge's patent asphalte. There are spacious warehouse rooms on the respective floors at the east end of the building. Two stone staircases are provided at the east and west ends. The floors throughout are of fireproof construction (Homan's patent); these, with the structural ironwork, have been erected by Messrs. Homan and Rodgers. Generally they are covered with Mr. Roger Lowe's pitch-pine blocks, but in the basement and some other parts Stuart's Granolithic paving has been adopted, the first-floor corridors being laid with marble mosaic, the ground-floor mosaic being executed in vitreous work. Two hydraulic lifts, suitable for passengers and goods, are placed, the one in the centre, the other at the east end of the building. There is also a lift for the conveyance of papers from the ground floor to the basement paper-store, and two hand lifts from the publishing department to the compositors' rooms. Speaking tubes are fitted to and from the heads of the several departments, also electric bells. Hayward's lights have been extensively and successfully introduced at various points of the premises. The lavatory arrangements, which are to be found on every floor at both ends of the building, have been carried out by Mr. George Jennings. The gas has been laid on throughout the building by Messrs. Hart, Son, and Peard, who have also supplied most of the fittings. The wrought-iron chandeliers on the first floor and the Wenham lights on the ground floor, also the wrought-iron railing on staircase and outside, have been executed by Messrs. Starkie, Gardner and Co. The electric light service and fittings, some 700 lights being introduced, are being installed by the Fyfe-Main Electric Lighting and Construction Company.

CHURCH OF ST. JOHN THE BAPTIST, BURFORD, OXON.

(See description on page 174.)

"ET VERBUM CARO FACTUM EST."

This drawing is an illustration of an aspect of the Incarnation; the idea being to express the union of the human life of Christ at all ages with the Godhead. The principal figure is the youthful Christus holding a book, with a sentence displayed from the first chapter of St. John's Gospel, "And the Word was made flesh and dwelt among us." The screen behind the figure may be taken to represent the veil of material existence into which He entered, and the adoring intelligences above are therefore placed on the further side of it. The composition was designed as a decoration for a space in a church, but it has since passed into the hands of a private purchaser.

HOUSE NEAR EAST GRINSTEAD.

This house is now in course of erection for Mr. Richard Gunter on a charming site near the village of Turner's Hill and about a mile from the railway station at Grange-road. The walls are of stone, quarried upon Mr. Gunter's estate. It is a fine-grained sandstone, of a warm cream colour, and singularly free from any defects. When first quarried the stone is soft and easily worked, but rapidly hardens when exposed to the air. Blocks of several tons weight are being got out of the quarry, which appears not to have been worked for a century or so, although one or two good houses in the vicinity are known to have been built of it some 200 years ago. The upper walls and roof are covered with Broseley tiles. The half-timber-work is executed in oak. Mr. George Box, of Ardingley, is the builder, and Mr. Edward W. Mountford, F.R.I.B.A., of Buckingham-street, Charing-cross, is the architect. The cost is about £1,000, exclusive of the stone, which is delivered free upon the site by Mr. Gunter.

QUEEN'S PARK CONGREGATIONAL CHURCH AND SCHOOLS.

This church and schools are situated at the corner of Third Avenue and Harrow-road on the Queen's Park Estate of the Artisans', Labourers', and General Dwellings Company. The schools were built in 1884, and consist of a complete suite of class-rooms, vestries, kitchen, &c., on the ground floor, and a school-room, 67ft. by 34ft., on first floor, holding 500 people, and having a gallery at south end. The church, which has just been completed, accommodates about 1,500 people, and is 96ft. long by 54ft. wide, having a large nave, 31ft. wide, and aisles each side, with an arcade of six arches. A spacious gallery is carried all round the church, and is approached by means of three staircases, one communicating directly with the school-room above referred to. Under the north end of gallery are provided week-night, ministers' and deacons' vestries, and other accommodation. The tower between the schools and church, which contains a staircase, is at present only 60ft high, but will eventually be carried up as shown to a height of 125ft. The walls internally are faced with red brick, with stone and moulded brick dressings. The roofs are open, with wrought timbers and panelled ceilings, that to the church being 50ft. high and that to school-room 34ft. The gallery-front, rostrum, and doors are executed in oak. The buildings are faced outside with red brick, with Box Hill stone and moulded brick dressings. A feature has been made of the two outside open porches to church: these are executed in gauged brickwork with brick vaulting and stone columns and dressings. The cost of the church just completed was £6,000. The architect is Mr. Rowland Plumbe, F.R.I.B.A., 13, Fitzroy-square, W. The builders were Messrs. Treasure and Son, London and Shrewsbury. Mr. L. G. Trund was clerk of works.

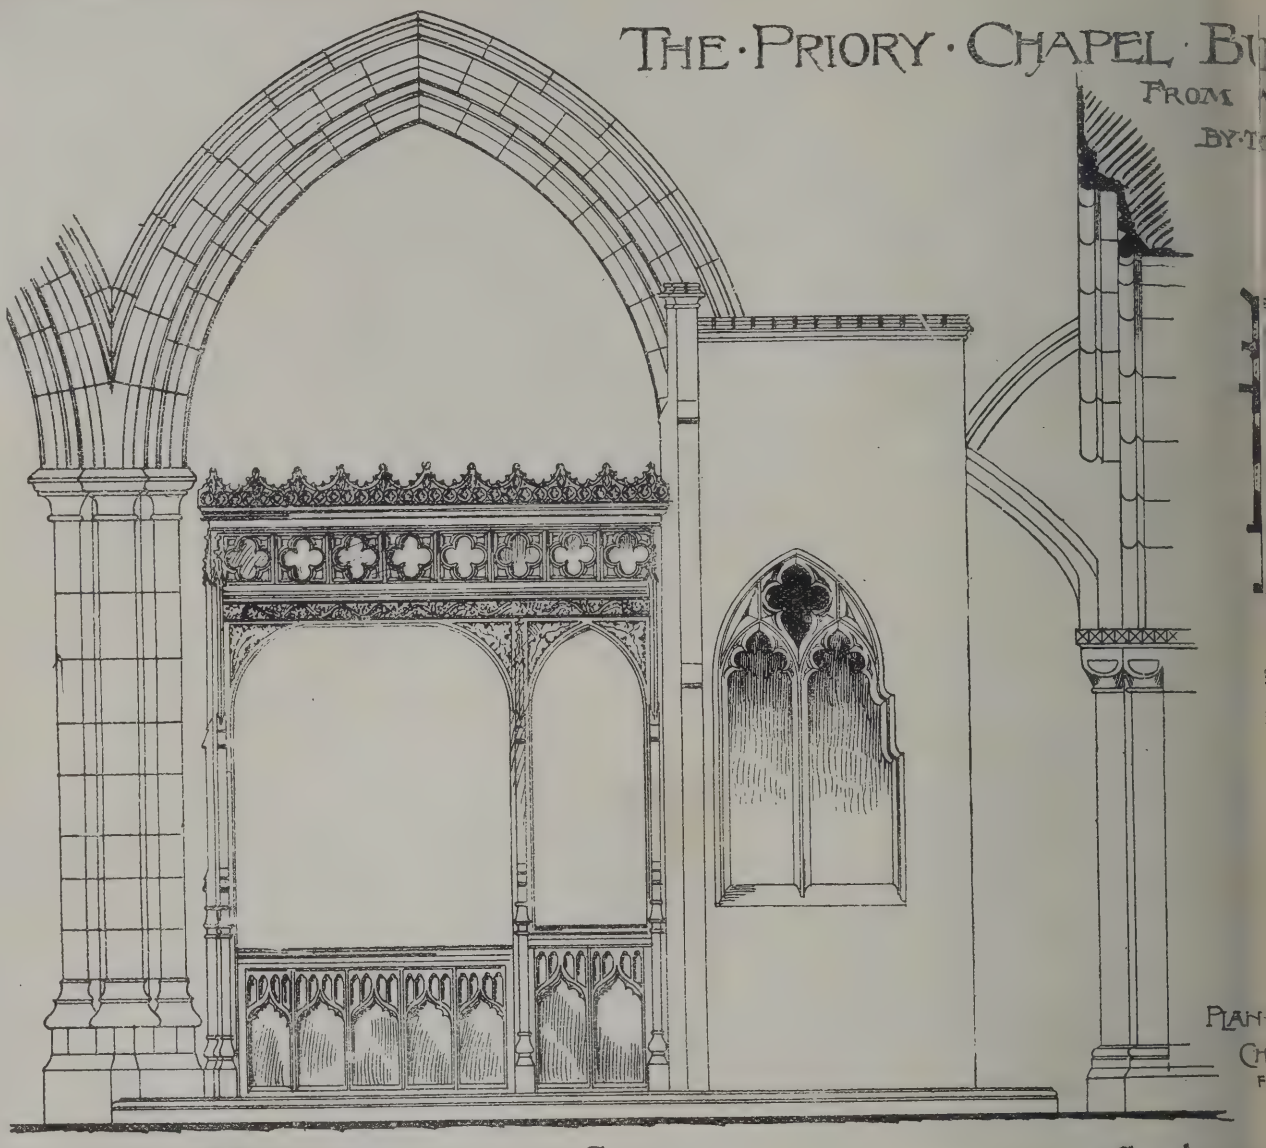
ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Wiltshire Archæological Society.—The concluding excursions in connection with the annual meeting of this society were held on Friday. A party of about one hundred and fifty including General Pitt-Rivers, the president proceeded by brakes from Devizes to Potterne. The church was built in the early part of the 13th century, and the font and the north door are of that period. The party then proceeded to the Old Porch House, the property of Mr. W. B. Richmond, R.A. Various ideas were hazarded as to the date of the building, but it was generally agreed that it was Elizabethan. The floors were originally of mud and rushes, but Mr. Richmond has them laid with splendid tesselated pavements. After inspecting the museum of curiosities, they proceeded to Market Lavington, where Mr. C. E. Ponting read a paper, saying that formerly a Norman church stood here, and was rebuilt in the 14th century. A feature of the church was that the floor originally sloped with the natural level of the earth. The tower is 15th century, but the rood of the chancel is the original 14th-century rood. The party then proceeded to Erchfort, where the 13th-century church there was described by Mr. Ponting.

CHIPS.

A complimentary supper was given last week at Truro to the contractors, Messrs. Clemens and Tippett, and their staff, who have erected new business premises in River-street for the present mayor of that city. The architect, Mr. Silvan Trevail, was present.

Lord Hartington attended on Saturday the laying of the corner-stone of a new church at Crawshaw-booth, Rossendale.



Mr. Mitton Ward, of Accrington, has been appointed town foreman of Weston-super-Mare. There were nearly 500 applicants for the appointment.

The Lords' Committee, in finally considering the London County Council Bill, increased the limit of the height of buildings from 70ft. to 90ft. The committee also decided that in the case of the destruction by fire of Queen Anne's Mansions, or similar buildings, compensation should be paid in case the County Council ordered that the buildings erected in their place should be of a less height than they were originally.

The new water supply for Newmilns, N.B., was inaugurated on Saturday. It is derived from springs at Allanton, about five miles from the town, and the engineer was Mr. Ex-Bailie Reid, of Kilmarnock.

At a general assembly of the Royal Society of British Artists, the following gentlemen have been elected members—viz., Messrs. A. Glendinning, jun., A. Hartley, F. W. Jackson, R. B. Nisbet, and Julius Olsson.

Queen-street Congregational Chapel, Wolverhampton, was reopened on Sunday, after being closed for repairs, the cost of which has been £1,500. The decorating has been carried out by Messrs. Lewis and Swindley, and the alterations and repairs by Messrs. Bradney and Co. The works have been carried out under the personal superintendence of the architect, Mr. Thomas H. Fleming, of Wolverhampton.

WAYSIDE NOTES.

Y remarks on the Bermondsey Free Library Competition were made in entire ignorance y incident of the kind to which you last alluded. I had taken it for granted that remiums had been awarded on the recom- ation of Mr. Elkington. If, as I have no t is the case, you have been accurately med as to the proceedings of the committee, ers must be viewed in a very different aspect. gaging an assessor, competition committees upposed to be providing against their own mpetency to judge the merits of architects' ns. Otherwise, why is he engaged? Is it use people are beginning to learn that, in r to get competition designs from architects y standing, they must appoint an assessor, her or no they intend to abide by his ion? If such is the case, we shall have er evil attendant upon a system already rkable chiefly for its shortcomings. We be compelled to take some step to nt the assessor becoming a mere bait to out to the crowd of competitors always to snap at anything that looks outwardly ing. I have little doubt but that this has often done in the past, and that behind the of the innocent assessor, with his big name reputation giving an air of verisimilitude to cene, are hidden the barbs that aim destruc- at the mass of competitors. Seeing the job have had to get the assessor generally inted in competitions, we should be jealous is position, and endeavour to prevent him ming, unwittingly, the source of new evils. not say that anything of the kind to which ve herein alluded has taken place in con- on with the competition referred to. It d be unfair to comment on the matter until thing more definite is known, so I would this note read as general, and as touching ompetition system as a whole.

nent the which, and on the subject of sors, I have lately thought that something it be said as to the qualifications of those ted to judge the merits of competitors' rings. Could not a little room for improve- t be found in the selecting of men specially l to fulfil the exigencies of each peculiar ? We are all right as regards town-halls buildings of a general and ordinary descrip- but we are often just as much *all wrong* re buildings requiring special knowledge for design are concerned. It produces any- g but an enviable feeling to learn that the sor appointed to adjudicate upon a competi- in which one is engaged is so lacking in nical knowledge of the subject in hand, and lly wanting in experience of the design of lings for the special purpose, as to be in- ble of appreciating the results of specially cted efforts and study. This galling experi- must be familiar enough to many old com- ors, and if something could be done to edy the evil it would be a great boon. ssors should be selected with more judgment forethought. In the majority of cases it not matter whether the assessor has or has special knowledge; so long as he is a good round architect, affairs will go smoothly igh. It is the exceptional instances that uld receive attention. An architect competing a free public library does not want an assessor has done nothing all his life but build and ore churches; and a designer of a matter-of- economically-planned public market does care to have his scheme judged by a gentle- n of the bottle-glass school. The competing urch architect" will not feel lovingly ards a committee who appoint an engineer- itect to place the premiums; nor will the itect-engineer be pleased to learn that a tleman who devotes most of his time to the oration of interiors is to examine and report o the relative merits of constructive schemes mitted by himself and others. The fact that malies like these do occur causes much stice and dissatisfaction all round. The orts of assessors disclose their ignorance to e who have the information that enables n to detect it, and where it happens that a cialist in one line is put to judge specialism in ther line, it is curious to see how everything iewed through coloured glasses, so to speak. igns for every class of building are judged ording to their merits in certain details may be in the specialist's way of iness, and broad facts are lost sight of in grubbing about for comparatively insignificant details. I noticed a remarkable instance of this a short time ago, where nothing was said as to the main provisions of an extensive design, every apartment in which required separate special study; but the scheme was generally commended because of its sanitary arrangements and the fact that the w.c.'s were against outside walls!

In enforcing the height of London buildings in accordance with the new regulations to be included in the powers sought by the County Council in their Bill now before Parliament, the Council will have to make certain definitions as to roofs, or we may suddenly find Metropolitan roofs grow prodigiously. I believe that two stories will be allowed in the roof. If not otherwise restrained, some people may find it convenient to put two uncommonly lofty stories in their roofs, and if they follow Mansardian principles, there won't be a vast amount of difference between the building proper and its roof. A roofed building is certainly less objectionable than the box-like structures of the modern flat-builder; but a big roof in a crowded city blocks out the light and air, and should be liable to pruning, like sheer walls.

London architecture is as much the outcome of authoritative restrictions as of any influences of fashion and taste; and I foresee a still further modification, or *development*, if so it may be called, when the new regulations as to height come into force. Those compelled, as many are, by necessity, or speculative ambition, to build to their utmost limits, will soon find that the problem will be how to provide the best possible accommodation without danger of contravening the law. Curb roofs will probably come into fashion, and a roof uncommonly like a bit of the solid substructure may be expected to arise, unless suppressed, at an early period of its career, by the action of the municipal authorities, to wit, the County Council. Unless some further and explicit definitions be made at head-quarters, we may some day see your "Legal Intelligence" columns sub-headed, "What is a roof?" and parties called to swear that a roof is not a roof, and that what is not a roof is a roof, whilst all the time we shall know that a roof is a roof all the world over. But perhaps, after all, so much ingenuity has been displayed in dealing with the roofs of London buildings, so as to get accommodation and yet not interfere with ancient lights, that there is little hope for novelty in treatment. Here, again, however, it will depend upon the definition of a roof for the purposes of the new Act, which may almost be regarded as passed. It may be that the ingenious draughtsman may yet get an extra cubic inch or two of accommodation in his roof when he sets to work on his sections under an Act of Parliament regulating the height of London buildings.

Before the third reading of the Public Health Acts Amendment Bill, Mr. J. Kelly moved an amendment to Clause 42, with the object of rendering it compulsory that a new road should be sewered and metalled before being taken over by the local authority. Mr. Kelly urged that the proposed alteration in the law which the Bill contained was a relaxation in favour of jerry-builders, who, acting in concert with petty local authorities, would be able to evade the provisions which were now insisted on. On a division of the House, the amendment was lost by a majority of 75. The result, perhaps, is all that could have been expected. One sympathises with the mover of the amendment in his endeavour to checkmate the jerry builder at every point; but in the present case, I do not see how the leaving of the sewerage and metalling of roads to the local authority would forward Mr. Buggins's interest. As a rule, such work is best done by the local boards, and it is rather hard on the owners of building estates to expect them to lay out a lot of money on a system of drainage, the outlet for which, perhaps, exists only on the town surveyor's plans which may or may not be carried out some years hence. This has often happened. The provisions of the Act, therefore, seem just, and the clauses concerning the taking over of roads by local authorities would seem good in that they may, in cases, facilitate matters in connection with the development of building estates. Moreover, the sewering and metalling is not infrequently a benefit to the general public of the district, and as such should be done at the general expense—that is to say, by the local board. As to the work itself, it should, as a rule, be more economically carried out under the supervision of local boards.

I must say, however, one of the finest pieces of ordinary estate road-making and sewering I have seen was carried out by the owners of the land. Those architects and surveyors, too, who have much to do with estate work will not think that the local authorities should make up and sewer roads. Long before they obtain any remunerative work on a new estate there is much to be done in road and sewer-making, if the owner himself do the work, as, indeed, he must do in most cases, roads and sewers not being found ready-made, in convenient positions, on building estates. There are thus contracts with road-makers to keep them busy till the surveying of the works of the speculative builder comes along; and whilst such means of livelihood remain, and building estates and leaseholding continue in vogue, it will not be the general wish of the architectural profession that town surveyors and surveyors to local boards should step into its shoes.

GOTH.

CHIPS.

A lecture hall and class-rooms are about to be added to St. Kilda's Presbyterian Church at Jarrow, from plans by Mr. J. W. Hanson, of that town.

In order to protect Cromer from the incursions of the sea, it has been decided by the Commissioners to extend the concrete breakwater for a distance of 94 yards, in accordance with plans and a report by their engineer, Mr. J. E. Teasdel, of Great Yarmouth.

A boys' school is being built for the Hastings School Board in Priory-road, West Hill. Mr. H. F. Humphreys, of Trinity-street, Hastings, is the architect, and the tender of Mr. W. Small, of the same town, has been accepted for the execution of the work at £2,628.

The work of adapting the ground-floor premises recently acquired by the Royal Institute of British Architects for the purposes of a council room and a secretary's office was begun by Messrs. Cubitt and Co. a fortnight since, under the professional superintendence of Mr. Aston Webb, hon. secretary; and it is hoped that the rooms may be ready for occupation in October. New window-openings are to be made in the north wall of the meeting room, with the object of obtaining more light and air.

Mr. George Manwaring, C.E., died at his residence at Swathling, near Southampton, on Friday, in his 81st year. Mr. Manwaring held the appointment of water engineer to the Southampton Water Commissioners from 1847 to 1851, and to the Southampton Corporation from 1851 to 1884, when he retired upon an allowance of £125 a year, with the rank of consulting engineer to the Corporation.

A fire occurred at Allfarthing-lane, Wandsworth, on Saturday night, and resulted in the complete destruction of the workshops of Mr. T. H. Brunsden, builder.

The death is announced of the Vicomte Calley Saint Paul de Sinçay, who was born at Paris in 1815. He was at the head of the zinc works of La Vieille Montagne for 45 years, and saw its *personnel* increase from 900 to 7,000.

At Belfast police-court last week James Rea, builder, of Gracehill-street, was fined in the full penalty of £5, with a continuing penalty of 40s. a day, for omitting to construct proper foundations to houses in Oldmark-road and Gracehill-street. The evidence showed that defendant, after being warned, proceeded with the erection of the buildings, using road scrapings in place of mortar, timber of insufficient scantling, as well as improper foundations.

A new Wesleyan chapel is being built in Westbury-park, Durdham-down, Bristol, from plans by Mr. H. D. Bryan, of that city. Mr. Lewis is the contractor, and the outlay will be about £3,000.

At the York Consistory Court, on Friday, a faculty was granted for the restoration of Aughton parish church. The whole of the pews and internal fittings, including the gallery, will be removed, and low seats substituted for the pews, and the building will be re-roofed.

The Gladstone Club at Northwich was formally opened last week. It is Elizabethan in character, and is of brick and half-timber work. The chief room on the first floor is 44ft. 6in. by 27ft. Mr. M. K. Ellerton, of Northwich, was the architect, and Mr. William Molyneux the builder.

PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—LXVIII.

A SANITARY CRUSADE ROUND THE WORLD.

THERE has just been completed a journey round the world by Mr. Robert Boyle, making his third circuit of the globe, which had for its object an investigation into the sanitary condition and arrangements of the different countries visited, with a view to awakening an increased interest in sanitary science, and securing the adoption of improved sanitary measures and appliances. The first place visited was Malta, where the sanitary arrangements were found to be defective in so far as that there was a want of proper ventilation for the drains and soil-pipes, otherwise the towns, Valleta in particular, were clean and fairly sweet. In Egypt it was different, the drainage of Alexandria and Cairo being by no means perfect, and any of the native towns in Arabia, Nubia, or the Soudan, visited by Mr. Boyle, would compare favourably with these cities in the matter of cleanliness. When in Cairo, Mr. Boyle surveyed the palace of the Khedive, for the ventilation of which plans have been sent in. From Egypt Mr. Boyle went to India, which country he traversed from Bombay in the west to Calcutta in the east, Madras in the south to the Khyber Pass in the North, touching the frontiers of Afghanistan and Kashmir, across the Himalayas to the borders of Thibet, and up the Brhamaputra through the valley of Assam.

The drainage of Bombay, which Mr. Boyle surveyed, and for the ventilation of which plans and estimates have been submitted, is shortly to be re-arranged, the present system being incomplete and unsatisfactory. The Boyle system of ventilation has also been adopted for the military barracks and officers' quarters, Bombay. Mr. Boyle was favourably impressed with the perfect sanitary arrangements employed at the "Towers of Silence," where the Parsees, disciples of Zoroaster and fire-worshippers, place their dead to be devoured by vultures—a somewhat similar plan to what Mr. Boyle has seen employed by the aboriginals of Australia for the disposal of their dead. At Delhi, Agra, Lahore, Peshawar, and other towns visited, the dry-closet system is used and seems to answer fairly well; but the water is bad, and unsafe to drink. At Benares and Calcutta the drainage was most defective, and the smells evolved from this source in certain quarters of these towns overpowering. In the former town cholera is never absent, and the customs of burning the dead on the banks of the Ganges in the rude and imperfect form in which it is done, and of throwing bodies into the river by those too poor to pay for burning, and which in time rise to the surface and float about in a decomposed state until consumed by vultures, are most pernicious practices, highly dangerous to health, as it is here the pilgrims congregate to bathe in and drink of the sacred waters of the Ganges. It is a common thing to see rows of dead bodies, many of whom have succumbed to the most infectious diseases, lying exposed at the burning Ghats waiting their turn, in the meanwhile, like destroying angels, though defunct ones, spreading death around them. Efforts have recently been made by the local engineer to improve the drainage of Madras; but, owing to ignorant interference on the part of certain of the city authorities, with but small results, though the principle advocated is correct.

In Ceylon the sanitary arrangements were fairly satisfactory, though somewhat primitive; but at the Straits Settlements, Penang and Singapore would vie with Calcutta itself for noxious smells. Hong Kong, at one time known, owing to its frightfully insanitary condition, as the "White Man's Grave," is considerably improved in this respect, and is now comparatively rather a healthy place to live in. It has a splendid water supply stored in the hills, and which is brought into the town by a fine aqueduct.

At Canton Mr. Boyle surveyed and supplied plans for the ventilation of the famous French Cathedral, erected under the auspices of Louis Napoleon. He has also furnished plans for the ventilation of the summer palace of the Emperor of China at Pekin, which was partially destroyed during the war of 1860, but is now being restored. This palace, different from the one now occupied by the Emperor at Pekin, which is of pure Chinese design, is built after the French style of architecture, and resembles the palace at Versailles, it having been designed by French Jesuit missionaries.

The sanitary condition of Pekin, as, indeed, of all the Chinese towns visited, Mr. Boyle found to be of the most deplorable description, the streets being practically nothing but open sewers and loathsome cesspools, into which all manner of filth is thrown and allowed to lie and putrefy, and from which arise an indescribably sickening and suffocating stench, only to be compared to what Mr. Boyle has experienced in some of the native villages in Morocco. The water, drawn from the most impure sources, is positively poisonous, being, in many places, simply the drainage from the streets and fields, which are liberally manured with human excreta in a liquid state, necessarily containing a large percentage of disease-germs. The dead are also never buried, being merely encased in rude coffins and laid anywhere on the fields amongst the crops, and in the course of time covered with mounds of earth. This gives China the appearance of one vast graveyard, and, as a matter of fact, though the population is over three hundred and forty millions, there are infinitely more dead Chinamen above ground in China than living, of which one is but too forcibly reminded by the unsavoury odours emanating from them. Under such conditions it is not to be wondered at that cholera, typhoid, and small-pox are constantly prevalent, especially the latter, which the majority of the Chinese seem to suffer from, few or no precautions being taken for the prevention or cure of the disease, it being quite a common thing to see people going about suffering from it in its different stages. A very curious method of inoculation is occasionally employed, which is to take some of the virus from a person having the disease and blow it up the nostrils. Vaccination is also sometimes performed on the temples. There was rather a severe outbreak of cholera in Pekin when Mr. Boyle was there, chiefly caused by eating raw, unripe vegetables, which the Chinese have a bad habit of doing. With regard to cholera, Mr. Boyle draws attention to a somewhat ominous fact of special interest at the present time, that every great epidemic which has swept the world has invariably been preceded by an epidemic exactly similar to what has just been experienced and named the influenza.

Mr. Boyle has submitted to the Chinese Government—through Li Hung Chang, the great Viceroy and virtual Ruler of China, whom he had the honour of meeting at Tientsin—suggestions for the amelioration of this unhappy state of things, which he had previously, in a modified form, submitted to the late Marquis Tseng when Chinese Ambassador to this country, and who took a deep interest in sanitary and other advanced ideas.

Mr. Boyle's visit to Pekin was principally for the purpose of conferring with the Marquis Tseng *re* the adoption and carrying out of his plans; but on his arrival in China he learned of the death, from typhoid fever, of—next to Li Hung Chang himself—the ablest and most progressive man in China.

When Mr. Boyle was in North China, a memorable event took place during the progress of the Emperor to the new Tombs. He, the Emperor, on that occasion, travelling openly and showing himself freely to the people, who, for the first time, gazed upon the features of a Chinese emperor, the death penalty, accompanied by frightful tortures, being formerly meted out to any who, wittingly or otherwise, cast their glance upon the sacred person of the descendant of the Sun. The torture as a punishment is practised all over China, and Mr. Boyle has witnessed, at different places of execution, cruelties perpetrated on the wretched victims of so horrible and ghastly a nature, that the mere description of them would make the soul sick with horror. Such diabolical atrocities can scarcely be conceived, and the most refined tortures of the Spanish inquisition pale before them.

Infanticide is another inhuman custom still practised, and in the streets of Pekin itself, in the early morning, dogs and pigs, covered with the most disgusting sores, with which the streets of the capital are infested, may be seen contending with each other for the body of some newborn female child, first strangled, and thus disposed of by its unnatural parents.

The Great Wall of China being but thirty miles distant from Pekin, Mr. Boyle was able to satisfy himself as to its existence, and that it was not a myth as asserted in the *Times* and other quarters. The wall is 25ft. high, 25ft. wide at the base, and 15ft. at the top, though these dimensions vary at different parts of the wall, which is said to be over 3,000 miles in length, and consists of a granite foundation, and two walls of large flat bricks of almost the solidity and hardness of granite, the space between being filed with firmly-rammed mud. It is now in a state of hopeless ruin, and utterly useless as a means of defence even against the wild Tartar hordes it was built to keep out. The wall surrounding the Tartar city of Pekin is esteemed the strongest in the world, being 60ft. high and 50ft. thick, defended by massive buttresses every 300 yards. It is built in a similar way, and of the same material as the Great Wall. The strength of this wall is only approached in a modern structure by the new Mormon Temple at Salt Lake City, which Mr. Boyle surveyed professionally last year, the walls of which at the ground level are 25ft. thick, built throughout of solid-dressed granite blocks.

When in Shanghai, a place which has a most treacherous climate, owing to the sudden and extreme changes in the temperature, Mr. Boyle tested his system of ventilation as applied to the Shanghai Club, said to be the finest club in the East, and the following report from the architect, Mr. J. Cory, F.R.I.B.A., testifies to its success:—

"The application of your system of ventilation to the Shanghai Club has proved so successful, and given such satisfaction, that I purpose using it exclusively in my practice here. Your latest improved air-pump ventilator has successfully withstood the trying conditions of this climate where open pipes and other such arrangements have proved useless."

It will be observed that the open pipe, when employed as an exhaust ventilator, answers no better in the East than it does in this country, according to Sir Douglas Galton, President of the Sanitary Institute, who, in condemning its use, says: "In consequence of the numerous causes of disturbance enumerated above, this method of extraction, when applied to a house, could not be relied on to act on all occasions with certainty as an extraction shaft." Mechanical and other artificial methods of ventilation were also found to be as unsatisfactory, as is notoriously the case at the London Law Courts and other public buildings where this very unreliable and costly means of ventilation has been tried.

Mr. Boyle's system of ventilation for ships has been adopted by the Chinese Merchants' Steamship Co., Shangai, who own the largest fleet in the Chinese seas, and a number of steamers have already been fitted with the air-pump ventilators, which are now in successful use in the fleets and navies of nearly every country in the world. The Chinese and Japanese Governments have the system at present before them with a view to its general adoption in their war-ships, China now possessing one of the finest navies afloat.

In Japan Mr. Boyle was very cordially received by the chief Government officials and local authorities, who gave him every assistance in his investigations into sanitary matters in that interesting and progressive country, and were much pleased with the improved schemes of ventilation and sanitation submitted to them, the advantages of which they seemed fully to appreciate. Mr. Boyle was requested to make a survey of the new Imperial Houses of Parliament at Tokio, the capital, and prepare plans and estimates for the ventilation of these buildings, which has been done. He also surveyed the Imperial University of Japan, Tokio, and furnished plans for the ventilation of the different colleges.

Excreta in Japan is disposed of by using it in a liquid form, as in China, to manure the land, and is removed daily from each house in small wooden barrels. The water supply is, in consequence, polluted and unwholesome to drink, though not so bad as in China, as the dead are not laid to rot on the fields, but doubled up, carefully packed in a square box, and buried in the gayest and most festive manner, the cortége resembling more a marriage procession than a funeral. In many parts of Japan, when a person

is ill, the treatment employed has certainly the advantage of simplicity, it being to stick the fleshy parts of the unfortunate patient full of needles, and trust to the Japanese equivalent for Providence.

Mr. Boyle returned to England *viâ* America and Canada, important contracts being pending in San Francisco, and plans having been sent in for the ventilation of the Canadian Houses of Parliament, Ottawa. Mr. Boyle was pleased to find in America a more awakened interest in sanitary matters than existed last year, when he visited all the principal towns in the United States, Canada, and Mexico, having interviews with President Harrison and other leading American statesmen, who then assured him of the intentions of the Government to advocate improved sanitary measures. It is Mr. Boyle's intention to publish shortly in book-form his experiences in the East.

CONGRESS OF SCOTTISH COUNCILS ON PLUMBERS' EDUCATION AND REGISTRATION.

AT the congress of Scottish District Councils for the National Education and Registration of Plumbers, held in Edinburgh on Thursday and Friday last week, Dr. Alexander Crum-Brown presided, and there were present delegates from Edinburgh, Glasgow, Aberdeen, Dundee, Dumfries, and Inverness Councils. The question first discussed was whether legislative sanction was necessary to give complete effect to the Registration system. It was urged that plumbers (both masters and men) must be made to realize their responsibility in regard to the public health, and that the power and penalties of an Act of Parliament were necessary to insure that none but duly-qualified men were allowed to practise. At the outset, however, the rights of all qualified plumbers already in practice should be preserved. After considerable discussion it was unanimously agreed that Parliamentary powers were necessary to give practical effect to the Registration system.

The second question, "Can certificates be cancelled or suspended under the present voluntary system," was also answered in the affirmative.

A resolution was passed expressive of the opinion of the congress that a graduated scheme for education of plumbers was feasible and desirable; that workshop practice should form part of this scheme; that the scheme of the Worshipful Company of Plumbers should be considered by the District Councils; that all apprentices should be indentured; and that the masters should interest themselves in the education of their apprentices.

Some reference was made to the question of registered and unregistered work, but it seemed to be the general feeling that the power of registered plumbers would certainly increase with their numbers.

The Chairman, in bringing the congress to a close, said that it had been even more successful than he had hoped, and he had hoped a good deal. The remarkable frankness of the discussions, and the harmony that had prevailed, showed that the members had definite opinions of their own which they were quite ready to submit for the consideration of the congress. A truly remarkable unanimity had also been displayed, and this was not the result of anyone hiding his views either from fear or bashfulness, and it was the result of real unanimity of opinion. He was truly gratified that the congress had been held in Edinburgh, and hoped that Glasgow would have an even better one next year.

BUILDING AND ENGINEERING TRADE DIRECTORIES.*

THE sixth editions of each of these indispensable works of reference, fortunately, are contemporary with pleasanter anticipations than those which marked the introductory chapters of the last editions. In 1886 the long years of depression were hardly over; but the retrospect of the past four years is a more cheering one, and the prospect more satisfactory still. Of what importance it is to the country that the building and engineering trades should be fairly prosperous the compilers remind us when they bid us remember that London alone uses seven hundred millions of bricks yearly, that our annual wood imports nearly reach twenty millions sterling, and that 6,898 architects, 5,394 surveyors, and 30,699 builders are in business in the United Kingdom, employing, directly or indirectly, more than 750,000 skilled artisans and nearly 600,000 general labourers and mechanics.

The engineering trades employ still more men and capital, and it is manifest how absolutely necessary are such accurate and reliable guides to the whereabouts of the hundreds of thousands thus engaged as Messrs. Kelly and Co. publish. They grow in bulk every time a new edition appears, and the vast care and industry inseparable from such undertakings are probably hardly appreciated at anything like their full value by those who gratefully avail themselves of the result. They stand alone and unrivalled, and are likely to do so.

* Kelly's Directory of the Building Trades, 1890; and Kelly's Directory of the Engineers' Iron and Metal Trades, 1890. (London: Kelly and Co.)

NOTES ON BUILDING PRICES.—V.

By John Leaning.

FOREMAN.

IN pricing a bill of quantities or otherwise preparing an estimate, the cost of maintaining a foreman on the works is best kept separate. He will be on the work at the beginning and ending of the building operations, and at both periods there will be very few men to supervise, consequently the general prices are best calculated without foreman. It will be expedient to find out either by calculation or reference to the early part of the bill, or to the conditions attached to the specification, what stipulation there may be as to times of completion. Calculate somewhat more than the prescribed period at about 60s. per week, the average rate of payment. In the country the foreman would, as a rule, be paid lodging money beside. In pricing work the foreman's time in day accounts is generally treated as a charge which the general rate of profit should cover. An allusion to foreman generally appears in a well-prepared schedule for day accounts. A clause is inserted which deals with general foreman's time, sometimes as follows:—"The above prices and prices for day work generally to include use of scaffold, and all tackle, tools, tool sharpening, water, and general foreman's times; subordinate foremen to be charged as ordinary workmen. Time for fixing and removing scaffolding will be allowed." It is sometimes advisable to depart from this rule when a foreman has only two or three men to supervise, as in the case of the time for completion being protracted by items of extra work. A good foreman on a building benefits all the parties concerned. He should know the quantity of work every man should do, and the amount of work which all the men together should do in a given time, and can help the work forward to a very great extent by putting men in their right place.

FIRE INSURANCE.

An agreement exists between the leading insurance offices as to rates. The charges for buildings in course of erection are as follows.

	1 month.	3 months.	9 months.	12 months.
For each £100 assured	s. d. 1 0	s. d. 1 3	s. d. 2 0	s. d. 2 0

There are some offices which charge more; but this scale may reasonably be taken for the pricing of estimates. Where more is claimed, the proper course is the production of the receipt. Insurance is usually postponed until some combustible material is fixed: if it is left to the option of the contractor; but more generally there is a specific stipulation as to time in the conditions of contract.

When the time allotted by contract for the erection of a building is exceeded, it becomes a question who shall pay the further charge for insurance. If the delay is the fault of the contractor, he should pay; if not, the building owner is liable.

WATER.

A bill of quantities should include an item for supply of water, and in any case the estimates must allow for it. When no water company supplies the neighbourhood, water may sometimes be obtained near the surface by digging, and the cost of well curb, digging, and use of tubs for storage must be reckoned. When there is an existing well and pump, the cost of pumping and storage, or it may be necessary to bring it from a lake or river, in which case a butt on wheels is most convenient for the purpose, when one such source of supply is clean and the other dirty, the use of the former will probably be insisted upon. In some cases, when water is near the surface, Norton's tube-wells may be advantageously used. A local carter will probably have a water-cart suited for the purpose, or a street watering-cart may be available, or a liquid-manure cart; whichever it may be, its capacity must be ascertained, the number of loads a day, possible or required, and the price per load for cartage. A butt will convey 108gals., a liquid-manure cart generally 120gals., water-carts are made to contain 200, 250, or 300gals., water-vans 350, 400, or 450gals. The filling with a bucket on the end of a pole is a tedious but common method, and it is preferable to agree for water supply by the load, to hiring cart and man by the day. When there is a local water company, the cost of a building supply may be easily discovered by inquiry. Some of the country corporations supply their jurisdiction with water, and publish their water regulations with their by-laws. London and its suburbs is supplied by eight water companies, each of which publishes a set of regulations to be observed in its district. These special regulations are similar in character. They generally stipulate that pipes shall be a certain depth below the surface, that the fittings shall be approved by the turncocks before connecting with main; some of them define the size of pipes and describe the cocks. The regulations of the local water company should always be examined before making an estimate, and they should be preserved for future use. Each of the London companies is constituted by a special Act of Parliament, which incorporates the public Acts relating to water companies. The chief concern of the estimator is the schedule of special regulations published by the company (obtainable by any applicant), and the Board of Trade regulations made under the Metropolis Water Act, 1871, which affects all the Metropolitan companies. These are amalgamated by some of the companies with their general regulations; others publish them separately, or copies may be obtained from the Government printers (Eyre and Spottiswoode). Application for a building supply is made generally on a printed form, the different companies requiring different information. The company makes connection and opens ground and makes good, only so far as thus rendered necessary. The list of water companies with their offices is to be found in the "London Post-Office Directory." The usual charge for making connections and supplying ferule is 5s. (except Lambeth, which see). The cost of a building supply will be made up as follows:—

Water company's charges for connection
— feet of pipe, *use and waste* .....
Ball-cock ,, ,, ...
Soldered joint .....

All the companies require a stop-cock in the permanent supply pipe immediately outside the boundary of the property. The companies will not, as a rule, allow a pipe laid for building supply to be used for the permanent purposes, except by special application; but if a pipe of the necessary size be laid in at first, the applications would certainly be granted, and it may be used for the building supply. The charges by the metropolitan companies for a building supply are as follows. Some of them are based on annual values, some on the cost of the building, others on the work for which water is required, and this latter is the most reasonable. There is a map of the district supplied by each company in Firth's "Municipal London":—

Chelsea.—¼ per cent. upon estimated cost of building.

East London.—One shilling per rod on brickwork; one penny per cubic yard on concrete.

	s.	d.
Kent.—Not exceeding £100	10	0
Exceeding £100 and not exceeding £150	15	0
,, £150 ,, ,, £200	20	0
,, £200 ,, ,, £250	25	0
,, £300 ,, ,, £350	35	0
,, £350 ,, ,, £400	40	0
,, £400 ,, ,, £500	45	0
,, £500 ,, ,, £600	50	0
,, £600 ,, ,, £700	55	0
,, £700 ,, ,, £800	60	0
,, £800 ,, ,, £900	65	0
,, £900 ,, ,, £1,000	70	0
,, £1,000 ,, ,, £1,100	75	0
,, £1,100 ,, ,, £1,200	80	0

Above £1,200 by special agreement.

New River :—

	s.		s.
£100	10 each	£325	32 each
£125	13 ,,	£350	35 ,,
£150	15 ,,	£375	38 ,,
£175	18 ,,	£400	40 ,,
£200	20 ,,	£450	42 ,,
£225	23 ,,	£500	45 ,,
£250	25 ,,	£600 to £700	50 ,,
£275	28 ,,	£800 ,, £900	60 ,,
£300	30 ,,	£1,000 ,, £1,200	70 ,,

Above £1,200, 5 per cent. additional.

West Middlesex.—5s. per cent. on the estimated cost of building. When engines are used, an extra rate of £1 1s. per horse-power per annum will be charged.

Southwark and Vauxhall. — No published scale; rates based on value of building will be given on application.

Grand Junction. — Charges on estimated cost of building :—

	s.	d.	
£100 and under £500.....	8	0	per cent.
£500 ,, £1,000....	7	0	,,
£1,000 ,, £3,000....	6	0	,,
£3,000 ,, £10,000 ..	5	0	,,
£10,000 ,, £20,000 ..	4	0	,,
£20,000 ,, £30,000 ..	3	0	,,
£30,000 and above	2	6	,,

Should difference of calculation arise as to the estimated cost, then the charge to be fixed upon the estimated annual value at 1s. per £1 sterling of such value.

Lambeth.—No published scale; rates based on value of building will be furnished on application.

Charges for connection, including stop-cock, ferule, opening ground, and reinstating, constant supply district only—	s.
½in.	15
¾in., country district	21
1in., ,, ,, ...	30
1¼in., ,, ,, ...	35
1½in., ,, ,, ...	42

Other sizes by special agreement.

The above charges for opening, reinstating, and relaying are for ordinary trenches only; but if in opening a trench tar paving has to be broken and reinstated, an extra charge of 5s. will be made. If asphalte or wood paving, the extra charge will be 10s.

If the required quantity be very large, and the time for erection long, application should be made for supply by meter, and the charge would be at similar rates to the following. It would also be necessary to allow for the use and fixing of a water-meter, or the company would supply a meter at a rental.

Quarterly consumption.	Per 1,000 gals.
From 25,000 to 50,000 gallons	9d.
,, 50,000 ,, 100,000 ,, ...	8d.
,, 100,000 ,, 200,000 ,, ...	7d.
All above 200,000 ,, ...	6d.

If high-service, 25 per cent. additional on these rates.

The following are instances of amounts included in estimates for temporary plumber's work and storage of water :—

Cost of Building.	Amount.	
House at Kensington ..	£5,200	£1
House at Hornsey	£2,000	£4
House, Oxfordshire....	£3,900	£7
Alterations to London Printing Office	£2,700	£10

The quantity of water required for various kinds of work is as follows :—

A cubic yard of concrete dependent upon the quantity of sand in the ballast, the average quantity is about	25 gallons
A rod of brickwork in mortar, one of lime to three sand, about	220 ,,
Do. in cement, one of cement to two of sand	130 ,,
A superficial yard of render, float, and set	3 ,,

CLERK OF WORKS.

This item appears in specifications or bill of quantities somewhat like the following. Allow for an office for clerk of works, and for the requisite firing, lighting, and attendance. The cost of the foregoing will vary considerably; many contractors have movable structures which can be taken from their yard to the site of the building; in which case a percentage on its original cost may be reckoned. These are warmed by standing stoves. Others build a temporary structure with a fireplace, in which case a rough estimate of the cost may be made. Generally, two or three hours a day of a labourer will be expended on attendance. The cost of fuel will depend upon the season of the year.

A common charge in the winter is 6d. per day for fuel, and the rent of the office may be reckoned at about 2s. 6d. per week. The following are sums actually allowed in estimates, but are not valuable guides, as the circumstances vary :—

	Contract.	C.O.W. office.
For an alteration in the country	£9,000 ..	£10
For Schools in Surrey	£4,900 ..	£30
,, House at Chelsea	£3,400 ..	£10

Attendance.—A properly written specification usually contains a clause to the effect that each trade shall attend upon and make good after all other trades; but whether it does so or not, the contractor is bound to complete his work, and under one condition or another of most contracts his liability could be established. In pricing a bill of quantities it must be examined to discover the extent of detail adopted by the surveyor in his treatment of this item. There is a growing tendency with surveyors to enumerate everything in this way that can be clearly defined, and it may be admitted that the less left to speculation in a bill of quantities the better. The expense of attendance depends greatly upon the quality of the management; the estimation of its value must always be regulated by this consideration, and, consequently, speculative; only experience and careful observation will enable the estimator to value it. When a sum is provided for the whole of the gas-fitting, hot-water work, or electric lighting, and no mention is made of attendance, it may be assumed that the attendance is included in the amount. In the case of a separate estimate by a specialist, it will always be found that the attendance costs less if he does it than when it is done by the general contractor, for if the latter does it the specialist has no interest in the economy of the labour of his attendant, and he will probably keep a bricklayer or labourer always with him, whether he requires his service or not. An arrangement can always be made (though not without trouble) that he shall supply his own attendance; this course, however, has its drawbacks in the division of responsibility and the inferior quality of the work in making good. Special protection to work done by independent contractors may properly be charged as an extra on the contract if not mentioned in the quantities or specification. Some of the items of attendance enumerated in a bill of quantities by some surveyors and not by others are as follows :—Bricklaying, working in conjunction with masons in backing to masonry; cutting holes for pipes, and making good, cutting chases; carpenter, cutting holes for pipes, &c., and making good; plasterer, making good plastering to ends of bearers, &c. Examination of the bill will show this, if the estimator knows what to look for. The uncertainty of estimators as to this item is shown by a few instances as follows. The bill in each case included all the above details :—

	Brickwork.	Plastering.	Concrete.
Water Company	52 rods	2,470 yards	79 yards
Do.	31 ,,	1,840 ,,	60 ,,
Well 75yds. away	55 ,,	1,500 ,,	177 ,,
Water Company	11 ,,	539 ,,	14 ,,

		Per cent.
Cost of building	£2,000, Dwelling-house	£5=5s.
,,	£3,900 ,,	nothing
,,	£5,200 ,,	£10=4s.
,,	£2,700 { Addition to a printing office. }	£15=11s.

Other items of attendance in A—the clearing away all dirt and rubbish, scrubbing floors, and leaving all clean—sometimes with this is described the cleaning of windows, and making good broken glass; in others a clause appears at end of Glazier—B: Leave all glass clean and perfect. The following are some instances from priced bills for A :—

	Cost of building.	Amount.	Percetage on total.
Dwelling-house..	£5,300	£5	2s.
,,	£2,000	£4	4s.
,,	£3,900	£2	1s.
Addition to print-office	£2,700	£2 10s.	2s.

Probably about 2s. 6d. per cent. would meet most cases. Some instances of item B are as follows :

Amount of Glazier's bill.	Amount of B.
£121 0 0	£1 0 0
32 0 0	1 10 0
73 0 0	1 0 0
4 0 0	0 5 0

If more exactness be required, the surface of floors and glass may be ascertained from the bill. The work of cleaning them is generally done by boys or labourers at spare times. A reasonable basis for the pricing is that a charwoman at 5s. per day would clean about twelve squares of flooring in a day of ten hours. From these data the value of larger or smaller quantities may be calculated. The quantity of building rubbish will depend upon circumstances. Sometimes joinery and masonry are prepared at the building, which would increase the quantity of rubbish. When these are done at the builder's yard, five or six loads of rubbish to each £1,000 worth of work is a reasonable estimate. In a work of alteration, that proportion would be largely exceeded.

ITEMS AT CONTRACTOR'S RISK.

In a good set of quantities a definition of the word "allow" is given thus: "Wherever the word 'allow' occurs in these quantities, the cost of the item is at the risk of contractor." The zealous architect or surveyor, in settling variations, will occasionally find in an original estimate an item of this character with a sum attached, for which probably no expenditure of time or material has been incurred, and burns to deduct if intact. He is usually met by the argument: "If this item had involved an expenditure of twice the amount included in contract, I should have been forced to do it without extra charge; consequently, the item should not be interfered with." The student will hear many such arguments, which "cut both ways," and may often adopt the principle with advantage in his own defence or for purposes of attack; and in this connection the estimator may be reminded that the fallacy of an argument may often be shown by requesting the claimant to give the details of his calculation.

EXCESSIVE QUANTITIES.

There is one other consideration for the estimator which has been a frequent subject of discussion—the extent of excess in quantity that may be expected in a bill. Perhaps excess is not so frequent as it was a few years ago; but it is not rare, even now, to see 5 per cent. taken off at the end of a bill by the estimator for full quantities. No doubt the closeness of the quantities will vary with the temperament of the surveyor—the personal equation, as it has been called—who prepares them; but the general principle now is (whatever it may have been in the past) to give the exact quantity to the best of the surveyor's ability. The author of "Estimating" says: "I would advise estimators to use prices of at least 2½ per cent. higher for works measured at completion and priced from a schedule, than they use for ordinary bills of quantities." Mr. Rickman said, in his paper on "Building Risks," read before the Surveyors' Institution, "Probably it will be near the mark to state that in very careful quantities taken from general drawings only, there is an excess of ½ to 1 per cent. (and there ought not to be more), and that there are various labours taken which a builder tendering will consider either not imperative or included in the general description of the work to the extent of possibly 1 per cent. on the value of the work; these points are commonly discounted by the successful tenderer. In the case of measurement, the excess may be considered as occurring to about the same extent, though it is likely to occur in different items from those which are likely to show excess in quantities; moreover all labours, and only those which are executed, are paid for. These points are also discounted in the case of tenders on a schedule." No doubt percentages varying from 5 to 7½ per cent. have been taken off amounts of summary, and it is still the custom with some of the older fashioned builders to do so. Just as some will still omit from their pricing *all* the extra labour in a joiner's bill, or all the labour items of the stone; but a much more rational plan is the pricing every item, and realising its exact rate of profit. It may be safely said that it is most unwise to take off any percentage from the quantities or measurements of a man who knows his business.

THE SOCIETY OF ARCHITECTS' SUMMER EXCURSION.

THE following is the programme of the forthcoming excursion of the Society of Architects into Kent. Members will leave their respective homes on Monday, August 25, or before, assembling at Rochester on that day:—

11.15 a.m. Assemble at West Doorway to Rochester Cathedral. Party to be conducted by Mr. W. H. St. John Hope, M.A. 1 p.m. Lunch at the Bull Hotel, as guests of the Mayor of Rochester, Mr. J. O. Moore. 2.15 p.m. Restoration House. Party to be conducted by Mr. S. T. Aveling. 3 p.m. Rochester Castle. Party to be conducted by Mr. S. T. Aveling. 4.30 p.m. Eastgate House. 6 p.m. Tea at the Bull Hotel, as guests of Mr. G. E. Bond (member). 9.6 p.m. Train from Rochester to Maidstone, arrive 9.39.

Members and visitors who choose will sleep at the Star Hotel, Maidstone, and will assemble on Tuesday as follows:—

10 a.m. The Museum. Party to be conducted by Mr. G. Payne, F.S.A., Hon. Sec. of the Kent Archæological Society. 11.30 a.m. All Saints' Church. Party to be conducted by the Rev. J. Cave Browne. 1.30 p.m. Lunch at the Star Hotel. 2.30 p.m. The Palace and perambulation of the town. Party to be conducted by Mr. Hubert Bensted, F.R.I.B.A. 4 p.m. Carriages at the Star Hotel, to drive to Detling Church. Party to be conducted by the Vicar, the Rev. J. Cave Browne, who invites the members to partake of light refreshments at the Vicarage. 7 p.m. Tea at the Star Hotel. 8.30 p.m. Train from Maidstone to Tunbridge, arrive 9.20. Sleep at the Rose and Crown Hotel, Tunbridge. Tickets for the drive, lunch, and tea should be obtained in advance from the Secretaries of the Society of Architects, St. James's Hall, W., price 7s. each.

WEDNESDAY, AUGUST 27.

9.30 a.m. Carriages in waiting at Hotel. 10 a.m. Visit to Bidborough Church. Party to be conducted by the Rector, the Rev. H. C. Elliss. 11 a.m. Arrive at Penshurst Place, the seat of Lord De L'Isle and Dudley (by special permission). Leave at 12.30. 1.30 p.m. Lunch at the Castle Inn, Chiddingstone. 4 p.m. Carriages in waiting. Drive to Hever Castle. 4.30 p.m. Arrive at Hever Castle, the seat of Mr. E. Heard (by special permission). 6 p.m. Leave Hever and drive to Tunbridge. 7.30 p.m. Tea at the Rose and Crown Hotel, Tunbridge. Sleep at the Rose and Crown Hotel, Tunbridge. Tickets for the drive and the lunch at Chiddingstone should be obtained in advance from the Secretaries of the Society of Architects, St. James's Hall, W., price 7s. each.

THURSDAY, AUGUST 28.

8.50 a.m. Train fron Tunbridge to Sevenoaks. Carriages meet the train at Sevenoaks at 9.30. 10 a.m. Arrive at Knowle Park, the seat of Lord Sackville (by special permission). Leave at 11.30. 12 noon. British Camp. Party to be conducted by Mr. B. Harrison. 1 p.m. Lunch at the George and Dragon Hotel, Ightham. 3 p.m. Inspect the collection of flint implements in the possession of Mr. B. Harrison. 5 p.m. Tea at the George and Dragon Hotel. 6.44 p.m. Train from Wrotham to Ashford. Arrive 7.42. 8.55 p.m. Train from Ashford to Canterbury. Arrive 9.23. Sleep at the Fountain Hotel, Canterbury. Tickets for the drive, admission to Knowle House, and the lunch and tea at Ightham should be obtained in advance from the Secretaries of the Society of Architects, St. James's Hall, W., price 9s. each.

FRIDAY, AUGUST 29.

10 a.m. The Cathedral. Party to be conducted by Mr. J. R. Hall. 12 noon. The Priests' Hospital and Ruins of St. Pancras Chapel. Party to be conducted by Mr. J. R. Hall. 1 p.m. Lunch at the Fountain Hotel. 2.30 p.m. St. Augustine's College. Party to be conducted by the Warden, the Rev. Canon Maclear, D.D. 5 p.m. St. Martin's Church. Party to be conducted by Mr. J. R. Hall. 5.30 p.m. Tea at the Fountain Hotel. 7.30 p.m. Special General Meeting of the Society of Architects in the Guildhall. Sleep at the Fountain Hotel. Tickets for lunch and tea should be obtained in advance from the secretaries of the Society of Architects, price 6s. each.

SATURDAY, AUGUST 30.

8.31 p.m. Train from Canterbury to Dover. Arrive at 9.12. Carriages meet the train. 10 a.m. Meet on the Castle Parade ground, and visit the Roman Pharos, Romano-British Church, Roman Baths, and remains of Saxon Church. Party to be conducted by the Rev. Canon Puckle. 11 p.m. Castle Keep and Oratory, Constable's Tower, and Line of Defences of Norman Confederate Knights (by special permission of Major-General Montgomery Moore). Party to be conducted by the Rev. Canon Puckle. 12.45 p.m. St. Mary's Church, with notice of Roman Baths and Saxon Collegiate Church (view the waterworks if time permits). Party to be conducted by the Rev. Canon Puckle. 1.30 p.m. Lunch at the Shakespeare Hotel. 3 p.m. Remains of St. Martin's Priory—adapted to the use of Dover College. Party to be conducted by Dr. Astley. 4 p.m. The Town Hall and Hubert de Burgh's Hospitium for Pilgrims of all nations. 5 p.m. Templars' Church and Citadel. 6 p.m. Tea at the Shakespeare Hotel. 7.15 p.m. Train to Victoria—arrives 10.10 p.m. 7.20 p.m. Train to Charing Cross—arrives 10.15 p.m. Tickets for the drive to the Castle and back, lunch and tea, should be obtained in advance from the secretaries of the Society of Architects, St. James's Hall, W., price 8s. each.

Members taking part in the Excursion are requested to inform the Secretaries as to which days they will be present, and to obtain tickets from them in advance. They are also recommended to secure beds in advance at the hotels named on this programme.

Tickets for members and friends (ladies or gentlemen) will be forwarded on receipt of cheques or postal orders for their value by the Secretaries of the Society of Architects, St. James's Hall, W.

STREET CURBS.

THE use of cast iron for curbstones has been introduced in France. The inventor, M. Nicot, a contractor for asphalte paving, has applied this cast-iron curbing to side walls. The curb is L-shaped in section. The lower flange, which is connected at intervals with the upright part by ribs for greater strength, is made to rest on a bed of concrete, which is also filled in upon the flange and between the ribs, holding the segment of curb firmly in place. The asphalte is finished to the edge of curb and on a level with it. During the process of filling in the concrete at the back of the iron curb, it can be kept in place by a peg of wood secured to the ribs by a wire; or a "fish-tail" rod screwed into an enlargement of the ribs at the joints in the curb has been suggested as a preferable mode of temporary fixing. The good old-fashioned granite curb cannot be improved; but it is not always obtainable in some districts. In the Western States curbs are sometimes made of artificial stone, and the "asbestine building stone" has been used for the purpose, which is made of German Portland cement and broken stone. The curb is made in 4ft. lengths, and in section 6in. at bottom and 5½in. at top, the upper edges being rounded. There is a mortise and tenon joint at the ends, moulded in the material. It is manufactured at Salisbury, Ill. The curbing made by several of the artificial stone companies has all the hardness of granite, and is well adapted for the purpose, and we should certainly prefer artificial stone to iron.

BOOKS RECEIVED.

The Law Relating to Civil Engineers, Architects, and Contractors, by L. LIVINGSTON MACASSEY, Barrister-at-Law, and JAMES ANDREW STRAHAN, LL.B. (London: Stevens and Sons), is a brief and concisely-written summary of the law suitable for the use of the professions. The law is laid down in a practical manner, the technical or strictly legal phraseology being avoided. The cases cited are well chosen, and contain nearly every one of importance. The authors deal with the retainer and remuneration of the engineer and architect, verbal contracts, contracts with corporations, joint-stock companies, local authorities, and school boards. The important questions of remuneration, forms of agreement, death of engineer or employer, and liability are concisely discussed. A very good form of letter stating terms of employment between architect and client, in which reference is made to commission, wages of clerk of works, and other points, is appended; but we do not find any allusions to travelling expenses. A longer form of agreement between a civil engineer and a local board is given. The remarks on professional skill and competence are illustrated by several important cases. Limited experience and "reasonable care" are matters that often arise. A client cannot expect a high degree of skill in all cases, nor can an architect or engineer blame his employers if the particulars they have furnished are incorrect, when he should have tested them for himself. A professional man also should be careful not to undertake work when he does not know whether he will be successful or not. He should be chary to adopt new methods in inventions, the efficiency of which has not been established. The moot question of preliminary drawings on approval, and whether they can be charged for, is discussed. Of course, the approval of the employer is a condition precedent to payment. Clients' approval of designs, care in preparation, warranty with drawings, are points constantly arising, and the authors suggest a "non-warranty clause" as an advisable precaution for the architect and engineer. Another subject, the property in plans, is discussed. Our remarks on this head lately made are practically supported by the authors. Tenders, bills of quantities, and specifications form other subjects, and useful cases are cited. The authority of the architect or engineer as a general agent in advising alterations and incurring liabilities, their responsibilities, right to support, light and air, party walls, certificates, arbitration, and the bearings of building statutes on various questions are among the other multifarious matters touched upon. A glance over some of them show that the authors are fully aware of the points likely to arise in carrying out contracts, and their book is a very useful summary of the law and *repertoire* of legal decisions.——*Domestic Sanitary Drainage and Plumbing*. By WILLIAM R. MAGUIRE, Dublin, Assoc. Inst. of C.E. of Ireland, &c. (London: Kegan Paul, Trench, Trübner, and Co.) As a registered teacher of plumbing in the City and Guilds of London Institute and registered plumber, Mr. Maguire's lectures delivered to plumbers and engineers will be found a very complete course of instruction for the practical engineer and plumber. The book, too, will be useful to architects in enabling them to understand the modern practice and appliances of domestic sanitary arrangements. The lecture form is not the best adapted for a treatise, and a good deal of the verbiage and the bulk of the volume could be dispensed with, especially in the earlier chapters. The practical remarks on water-pressure in cisterns, and the elementary remarks on hydrostatic laws, friction of fluids, flow of water through pipes, effects of adjutages, discharge and velocity of water, atmospheric pressure, transmission of heat, and other branches of science as they bear on sewage and plumbers' work are very useful, and well illustrated. The other chapters deal with sewage disposal and sewerage, in which the author describes the various processes, and the calculations necessary to find the velocity of flow in sewers under various heads and gradients. Private house drainage, the methods of laying and jointing pipes, the modes of laying drains under houses, plans of manhole chambers showing branches, various kinds of interceptor traps, are fully treated and illustrated by engravings. The methods of ventilation are also described and illustrated. Modes of testing house pipes and drains will be found of value. The chapter on sanitary appliances is profusely illustrated by every kind of closet and sink, and water supply is fully dealt with. The book is well illustrated and printed.

CHIPS.

Mr. J. Passmore Edwards has, says the *Royal Cornwall Gazette*, very kindly promised the inhabitants of St. Day a collection of books for their use providing there be a public room secured to store them, and a few influential townsfolk to look after them. As there is no available room just now, it is suggested that a committee be formed for the purpose of erecting suitable buildings on a piece of freehold property in the old Market-house which belongs to the town. At present there is no place where the inhabitants can go in and see a daily newspaper but a public-house.

The corner-stone of the tower which is being added to Haddlesey parish church, near Beverley, was laid by Lady Beaumont on Friday.

A Wesleyan school chapel, at Bishopston, Bristol, was opened on Sunday. It is Early English in style, is seated for 300 adults, and has attached to it five class-rooms and a vestry. A chapel will be built on an adjoining site hereafter. The outlay thus far has been £8,500. Mr. Herbert J. Jones, of Bristol, is the architect, and Mr. J. Perrott, of the same city, the contractor.

The members of the Derby Archæological Society made an excursion last week into East Derbyshire, under the leadership of Mr. J. B. Mitchell-Withers, F.R.I.B.A., of Sheffield. At Dronfield the church, which contains work of each period from the Norman to the Renaissance, was seen, after which Beauchief Abbey was inspected under the direction of Mr. J. D. Leader, F.S.A. Norton Church and the Oaks, the seat of Mr. F. W. Bagshawe, were subsequently inspected.

At a meeting on Tuesday of the Cheltenham town council, a long discussion took place upon a strong recommendation of the Water Committee that a sum of £130 should be paid to the retiring water manager (Mr. McLandsborough) for services rendered, in his view, outside the duties of his office. The mayor proposed the postponement of the consideration of the matter for a month; but an amendment that the recommendation be not approved was carried by 9 to 7.

The Bristol Master Builders' Association held their annual excursion last week, and Raglan Castle was visited by between 60 and 70 members. Monmouth and Tintern were seen on the way; thence to Chepstow, where dinner was served at the Beaufort Arms, Mr. E. T. Hatherly occupying the chair.

In a recent competition of local architects for a new grammar school for the governors of the Wheelwright Charity, to be erected in Halifax-road, Dewsbury, the design submitted by Mr. J. Lane Fox, Bond-street, Dewsbury, was unanimously adopted. The outlay will be about £10,000.

The Gas Light and Coke Company are making extensive additions to their offices in Horseferry-road. The roof of the strong room is on Fawcett's fireproofing system.

Building Intelligence.

Birmingham.—The grand corridor at the Council House has now been connected with the Art Gallery by an ornamental iron corridor. This corridor is 99ft. long by 10ft. 9in. wide, and 17ft. high from floor to highest point of roof, and is constructed of iron and glass, with lean-to roof. The roof is formed of wrought-iron rafters, glazed with Helliwell's patent system of glazing. The corridor is lighted by five gas pendants of four lights each. The whole of the work has been designed and carried out under the direction of Mr. Wheeldon, of the city surveyor's office, Birmingham.

Southampton.—The Duke of Edinburgh laid on Saturday the memorial stone of a new chapel attached to the Seamen's Mission and Institute, in Royal-crescent. The building is to be formed with red brick pointed in dark mortar, relieved with Doulting stone dressings. The chapel will be 57ft. long by 28ft. wide, and 16ft. high at the sides, having half pitch roof. The interior is divided into five bays by open framed timber trusses. The contractors are Messrs. H. Stevens and Co., of Millbank Building Works, Northam, the architect being Mr. W. H. Mitchell, of Portland-street, Southampton.

Warley.—The erection of the new Friendly Chapel and Schools, Warley, near Halifax, memorial stones of which were laid on July 26, is being pushed rapidly forward by the builder, John Turner, under the direction of Mr. Patchett, architect, of Halifax. The work is externally of stone throughout. The body of the chapel, which is without galleries, will seat 375, and the school accommodates 280 scholars. The building, with the boundary walls, gates, and approaches, will cost rather over £2,000.

CHIPS.

Representatives of a number of Metropolitan Vestries and District Boards, having met in conference in St. James's Vestry Hall, Piccadilly, have appointed a committee to prepare a Bill for the purchase of the undertakings of the Water Companies.

A new Wesleyan chapel is being built at Littlebeck, near Whitby, from designs by Mr. William Watson, of Lythe. The walling is of masonry, and Mr. J. Hutchinson, of Sleights, is the contractor. Memorial stones were laid last week.

The hotel which has been erected by the Liverpool Corporation at Lake Vrynwy was opened on Friday. The hotel is built in the picturesque style of an old English mansion, with timbered walls and gables. It is situated on the top of a wooded hill, at the north-east side of the lake, and is about 140ft. above it.

Bothwell parish church was reopened on Friday, after being closed for four months for alterations, consequent on the erection of an organ. The instrument, inclosed in an oak case, has been built by Foster and Andrews, Hull. Various structural improvements on the building have been carried out from plans by Messrs. Bruce and Hay, Glasgow. An oak pulpit, communion chair and table, font of Caen stone, ornamental brass brackets and standards, and oak choir seats are among the special gifts. The cost of the organ and alterations, excluding these gifts, is £1,200.

The Metropolitan improvements proposed to be carried out by the Bill which the London County Council will promote next session will be eight in number. They comprise the widening of the approaches to the Isle of Dogs; Fortess-road, Kentish-town; a proposed new street in Deptford; an extension of the Chelsea Embankment; alterations in Fulham Palace-road and Queen-street, Hammersmith; the widening of St. George's-place, Knightsbridge, and of the Albert Embankment, Vauxhall. Local contributions varying from one-half to one-fourth of the estimated outlay will be made by the several local authorities concerned, but no arrangements have yet been effected between the bodies affected and the Council in the cases of the Knightsbridge, Vauxhall, and Hammersmith projects.

A special meeting of the Guildford rural sanitary authority considered on Saturday the question of the pollution of the river Wey, first brought to notice by the complaints of the London Water Companies, whose intakes from the Thames are just below where the Wey discharges. As the sources of pollution from trade refuse and sewage are in several different areas the Guildford authorities felt powerless to act alone, and decided to request the Surrey County Council to carry out the necessary preventive works.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—T. C. H. and Son.—F. B. and Co.—T. G. W.—G.W. Ry. Co.—J. K. and Co.—F. M. and Co.—E. A. and Son.—S. S. B.

Correspondence.

BERMONDSEY FREE LIBRARY COMPETITION.

To the Editor of the Building News.

Sir,—It may interest some of your readers who sent in designs for the above to know that we wrote to Mr. Harrison, Clerk to the Commissioners, asking whether windows might be opened on the boundaries adjoining the Town Hall, and were informed that they could not. Also that on the morning the designs were to be delivered, the Commissioners held a meeting, and proceeded to examine the designs which had already arrived.

Do not the conditions of competition constitute an agreement between the Commissioners and the competing architects?

If so, would not some combined action on the part of the latter be advisable?

The conditions say that the Commissioners reserve to themselves the right of selecting the design to be adopted, but do not confer on them the right of selecting a certain number and awarding the premiums without first submitting the whole of them to their assessor for his report.

Briefly, the competition has been conducted in a most irregular and unfair manner, the Commissioners having repudiated the most important conditions, and arrogated to themselves powers they were not at liberty to assume.

This is not a question of person, but of principle, and it is quite time the members of the profession took measures to secure fair-play.—We are, &c., Gibson and Russell.

34, Craven-road, W., Aug. 6, 1890.

A new infants' school is being built at Kingswear, Devon, for the School Board, by Mr. J. E. Short, from the designs and under the superintendence of Mr. C. Sewell Appleton, architect, of Torquay.

Intercommunication.

QUESTIONS.

[10323.]—**Posts of Wood, Strength of.**—Spon's "Architect's, &c., Pocket-book," edited by Young, gives this formula (based on Hodgkinson, I believe):—

W = breaking weight in tons.
L = length in feet.
D = measure of square side in inches.

When both ends flat and when L exceeds 30 diameters solid square of dry red deal. Hurst's "Architectural, &c., Hand-book" gives a formula by Rankine:—

d = least thickness of rectangular pillar.
F = crushing force in tons per square inch.
l = length in inches.
W = breaking weight in tons.

[Fixed at both ends.]

$$W = \frac{F S}{1 + \frac{l^2}{a\,d^2}}$$

a = 250 for square sections.
a = 187 for circular ditto.

What would be the breaking weights of a fir post 10ft. long of section, 10in. by 10in. flat, and fixed at both ends, calculated by both the above formulæ, and supposing the weight required to crush a short length 1in. square to be 2½ tons in each case, and alternately 3 tons in each case. I make the results from each formula so different that I fear either that I have misunderstood the working or that there is a misprint. See a question and reply, pp. 228 and 280 Building News, Vol. XXXIV., year 1878, where it says that the Hodgkinson formula (as first above given) applies only to posts exceeding 30 diameters in length, and for shorter columns the result must be corrected by the further formula, $W' \frac{W \times c}{W + \frac{3}{4}c}$, which I do not understand, nor can I understand the working of same there given, where a given breaking weight for a long post is reduced to nearly half for a short post, which appears absurd. As I do not profess to have more than a smattering of mathematical knowledge, would correspondents kindly explain the working out? Wood columns, mostly of fir, square, flat, and fixed both ends, are of such common use, that a table of the strengths of various lengths and scantlings would be very useful. Is there any such table?—J. McA.

[10324.]—**One Chimney to a Number of Domestic Open Fireplaces.**—I notice, on viewing the designs for proposed infirmary at Halifax, that Messrs. Mills and Murgatroyd, of Manchester, show the nurses' block to have but one chimney shaft, and that apart from the building, the flues to the various fireplaces on the upper floors being gathered together by downcast shafts focussed in the basement, and then continued forward underground to a high shaft, similar to those used for factories. I shall be glad if the architects, or those having experience in flue-construction on this principle, will give information showing this system to be capable of construction on a scientific basis, and where, if possible, this method has been successfully carried out.—Polor.

[10325.]—**Landscape Gardening.**—Is there any work suitable for an architect on the laying out of private parks and grounds?—Iota.

[10326.]—**Storage Reservoirs.**—How are these constructed? What should be the capacity of one in a town of 15,000 inhabitants? Any information would oblige.—Engineering.

[10327.]—**Cost of Repairs.**—Is there not some general percentage for repairs on the cost of building? What should be the allowance for repairs of ordinary houses as regards rental.—H. H.

[10328.]—**Ripon Cathedral.**—Will some reader kindly furnish me with the dates of this cathedral? Who carried out the restorations?—Yorkshire Grit.

[10329.]—**Sanitary Authority.**—A house I have just taken on lease is very defective in the drainage arrangements. Can I call upon the sanitary inspector to make an examination and report to the landlord, or how should I proceed? Has not the local authority power to call upon a landlord to do all necessary alterations?—Tenant.

[10330.]—**Rolled Iron Joists, &c.**—Will "G. H. G." or some other correspondent kindly give me a formula for calculating the size of rolled iron joists for any given span and load; also formula for calculating size of wood floor joists for any given span and load?—the load in each case to be uniformly distributed, and greatly oblige—A Student.

[10331.]—**Church Needlework.**—Will any of your readers inform me where I can obtain designs for altar frontals, hangings, and vestments, describing the symbols used?—Designer.

[10332.]—**Racquet Court.**—What dimensions are necessary for a court? Of what materials should the floors and walls be? Should the latter be cemented or asphalted? Any particulars of a racquet court and its construction, also of any existing building, will oblige.—An Architect.

[10333.]—**Rood Screen.**—Is there any good example of a rood screen to be seen in London, ancient or modern, and where?—G. F. K.

[10334.]—**Design not Carried Out.**—I prepared designs for new premises, they were submitted to some builders for tendering, but owing to the cost exceeding the sum intended by my client, he has abandoned the design, and proposes to carry out only a portion of the plan. Can I make a claim for the first design as a distinct matter at the usual percentage?—Young Architect.

[10335.]—**Wiring Buildings for the Electric Light.**—Is it necessary to describe the operation of wiring on the specification; if so, what form should the clause take? A reply will oblige.—A. C.

REPLIES.

[10309.]—**Devonshire Churches.**—I had hoped "C. H. S." would have had other replies than "G. H. G." Allow me to add that the North of Devon, and thence to Plymouth, has much of interest, and with Totnes, Torquay, Dartmouth, Torcross, Kingsbridge, Ivybridge, and Modbury as centres (where good accommodation can be had), there are several outlying old churches well worthy of study which have probably escaped the student and sketchist. To one willing to take a few miles' walk from these places before his day's sketching, or quarter on local fare (perhaps with a hamper) in the village inn where railway whistles have not penetrated, and four-horse-coaches and carriers still ply, his church and Domestic architecture and furniture has the chance of being an original publication. Some are granite, others have Caen stone dressings, showing that France was practically nearer than Bath or Corsham Down, and the style (as many words in the dialect) is indicative of Continental intercourse. "Dutch" bricks are plentiful in old parts. Any student calling at Briny Cot, Dartmouth, is welcome to advice as to the route in the South Hams from—J. Parnell Lidstone.

[10320.]—**Electric Lighting.**—One rule is, in running wires, leads left, returns right on floors or ceilings; upon walls, leads low, returns raised. The wires should be exposed to view, as it enables leakages and faults to be found. The casings or mouldings grooved for the wires may be made part of the cornice or separate, or double-grooved casings with covers are used to conceal the wires. The casings are made of soft wood, and are manufactured by Mr. Elliott, of Newbury. The woodwork should be dry, and damp walls should be avoided. The wires should be hauled taut under flooring. Dadoes and skirting boards are favourable situations for the mouldings. A pressure of 200 volts is said to be without danger, and the "cut-outs" render accidents infrequent. Fuses should be inserted at the root of each branch. The wires should be of a capacity to carry the current, or they will become heated. The insulating coverings thould be of good material. By the use of safety fuses the current, when it attains a dangerous strength, is cut off before fire ensues. Many useful particulars are given in Urquhart's "Electric Light Fitting." —G. H. G.

[10321.]—**Public Libraries.**—Cotgreave's Indicator is one of the best forms, and consists of a large frame with metal slides divided into small compartments, each containing a small reversible metal case, which holds a ledger representing a volume in the library, which records its issues. The oldest form of indicator is that invented by Elliot of Wolverhampton. The book numbers are arranged in a series of vertical columns, each number having a vacant shelf. When a book is issued, its number and the date are written on a card, and is placed on the shelf opposite the number, and remains till the book is returned. Thus the presence of a card against a number shows that the book is out. Consult Greenwood's work on Libraries, and series of articles now appearing in the "B. N."—G. H. G.

PARLIAMENTARY NOTES.

The Stonework of Westminster Hall.—Colonel Anstruther asked the First Commissioner of Works, on Tuesday, whether his attention had been called to the decay of the new stonework on the west side of Westminster Hall.—Mr. Plunket: The new stonework of the new buildings on the west side of Westminster Hall has been carefully examined, and with the exception of two or three small stones, which are evidently soft, there is no decay. Some interesting stones which were taken from the old buttresses have, however, been re-used in corresponding positions in the new buttresses, and these, having been covered up in the old buildings for many years, are, now that they are again exposed to the atmosphere, showing signs of decay on the surface; but this, after a time, will probably cease. With respect, however, to the new stonework, which has been used as a facing to the main wall in the interior of the hall, certain patches of the work are undoubtedly decaying on the surface, and, strange to say, in the same places as the decay had principally occurred in the old stonework before the repairs were effected. The architect, Mr. Pearson, is quite unable to account for this mysterious decay, and assures me that the stone selected for the work (Ketton) is the best for the London atmosphere, and this opinion would appear to be borne out by its standing well on the outside of the building. It is believed that there must be some peculiarity in the mortar of those parts of the old wall where the decay is taking place, and I intend to have the matter thoroughly investigated at once.

Decoration of the House of Commons.—Mr. Plunket, in answer to Mr. Rowlands, said the general contract in which the decorating and painting of the House of Commons was included would terminate next year. A Departmental Committee was now sitting to inquire into the question of the terms upon which new contracts for such services should be made.

An Exhibition of Architecture is to be opened next month in Turin. Prizes and medals will be awarded to Italian exhibitors, and diplomas of honour to foreigners. Conferences on architectural subjects will be held during the exhibition. The committee arranging the affair are the leading local architects and engineers. There is to be besides an international exhibition of architectural publications, which, if well supported, ought to be of great interest.

Our Office Table.

Mr. Charles Roach Smith, F.S.A., the veteran archæologist and littérateur, passed away at the advanced age of 87 years on Saturday afternoon, at his residence, Temple Place, Strood, near Rochester. Mr. Roach Smith, who was born in Hampshire, spent the prime of life in the Metropolis, and gradually acquired a valuable collection of Roman curios and numismatic treasures. This was purchased by the trustees of the British Museum some thirty years since at a cost to the nation of between £2,000 and £3,000. After disposing of his collection Mr. Roach Smith, in consequence of failing health, took up his abode at Temple Place, a mansion on the banks of the Medway, where he has spent his time in literary work. Mr. Roach Smith was one of the founders of the British Archæological Society, and a member of many local archæological societies in this country and on the Continent. A medallion portrait in marble of the deceased, executed by Giovanna Fontana, was, two months ago, affixed to the walls of the Society of Antiquarians' Rooms in London; and still more recently the same society presented Mr. Smith with a gold medal, struck in his honour, together with a surplus of one hundred guineas.

A scheme for the practical trial of co-operative housekeeping is about to assume an actual form at Bedford Park, Chiswick, where it is intended to build a series of middle-class dwellings for working artists, literary people, and professional men. The houses are to be grouped round a central administrative building consisting of a general dining-room and kitchen, &c. This block will be connected with the houses by a cloister, and the residents are to be provided at a fixed tariff, either in their own homes or at the common hall. An associated home of this kind would economise the cost of administrative detail, and by this scheme of combination some, at least, of the difficulties of the domestic servants question might be overcome. Mrs. E. M. King some years ago endeavoured to start a plan of this sort with a central garden and school, but in that case the buildings were to be all under one roof, with a school incorporated with it. At the time we published the design of this proposed home, prepared by the late Mr. E. W. Godwin, F.S.A., and Mrs. King wrote a long description of her undertaking in our pages for April 24, 1874. The idea is, therefore, by no means new; indeed, the late Mr. Allen, of Stoke Newington, who built the first model artisans' dwellings in London, for years propounded a plan of this kind, though it never was realised. This notion of his was limited to flats, the only private rooms being really the tenants' bedrooms. The Bedford Park plan is to be worked with separate dwellings, where sitting-rooms as well as sleeping apartments are to be provided, as well as bath-rooms, w.c.'s, &c., and a gas-stove pantry for private or personal requirements will be introduced, but there are to be no kitchens in the houses. There may be a large class of people without families and those who now live in boarding-houses who would take up with this plan, but it is not likely to be adoped generally, of course, at any rate, in England.

The third annual Art Congress will be held at Birmingham in November next, opening on Monday, the 3rd. The Mayor (Mr. Clayton) will hold a reception on the Wednesday, and the Birmingham Royal Society of Artists will receive the members of the congress on the following day at the Edgbaston Assembly Rooms. The papers already decided upon to be read are—"Metal Work," by Alfred Gilbert, A.R.A.; "Modern Education of Sculptors," Onslow Ford, A.R.A.; "Technical Education," Mr. Redgrave; "Design," Henry Holiday; "Advertisements," Heywood Sumner; "Sculpture as Internal Decoration," Roscoe Mullins; "Municipalities in Relation to Art Schools," Stirling Lee; "Colour," Selwyn Image; "A Gallery of British Art," J. Orrock, R.I. There will also be the addresses of presidents of sections—viz., T. Graham Jackson (architecture), W. B. Richmond, A.R.A. (painting), and George Simonds (sculpture). Mr. Philip Rathbone will read a paper on the "National Encouragement of Art," and Mr. Mackmurdo one on "Applied Art." These will be supplemented by others by John Brett, A.R.A., Stanhope Forbes, and W. E. Britten, while J. E. Hodgson, R.A., and others will deliver art lectures to working men.

The French Minister of Public Instruction and of the Fine Arts has just issued as a Grey Book a report by M. Marius Vachon on the museums and schools of industrial art in the United Kingdom. The volume is the fourth of a series of reports by the same author published between 1885 and the present time on institutions of a similar kind in most of the other European countries. It is a volume of 252 pages, containing much interesting information, and draws a picture coloured in exceedingly roseate tones of the work accomplished by the South Kensington authorities. As the result of his inquiry, M. Vachon thinks that the "insularity" of which M. de Laborde speaks in his report on the character of English art in 1851, is a thing of the past; that the country is thoroughly alive to the necessity that exists for the technical and scientific instruction of the artisan population; that the Government and the official departments equally recognise the same necessity, if the commercial supremacy of the country is to be maintained; and that much has been done, and more is in progress, to still further extend the system. Incidentally, M. Vachon seeks to disabuse the minds of his countrymen against an idea which he says is widespread in France, and which is not unknown in this country also—that the art instruction given in the schools with which South Kensington has anything to do is "uniform—cast in the same administrative mould." He has found nothing of that in his tour. On the contrary, the local arts and industries of each district are, he considers, specially encouraged, and that they should be so fostered he was informed is the view of high officials at South Kensington.

At a meeting of the Sub-Corporate Property Committee of the Leeds Town Council, held on Friday, a report by Mr. J. T. Micklethwaite, F.S.A., of 15, Dean's-yard, Westminster, was read as to the result of his examination of the ruins of the abbey according to the instructions of the committee, expressing general approval of what has been done since they passed into the possession of the corporation, and it was decided that with a view to the carrying out of the necessary works of preservation the services of an experienced clerk of works should be obtained, as recommended in the report. A letter was also read from Mr. W. H. St. John Hope, M.A., assistant secretary of the Society of Antiquaries, in which he states, "Your excavations at Kirkstall have opened up things of the greatest interest, and by the time you have done Kirkstall will certainly equal Fountains in archæological interest. When all is done I shall be glad to undertake for the corporation a proper descriptive history of the abbey."

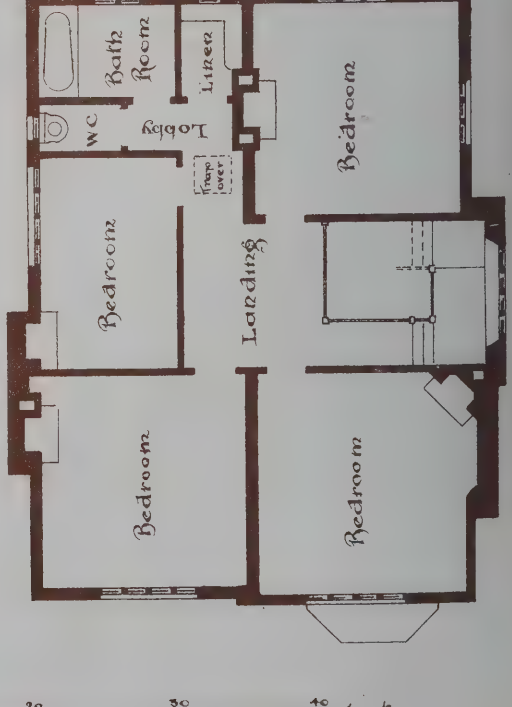
CHIPS.

The new town hall at Portsmouth will be opened by the Prince and Princess of Wales to-morrow (Saturday) afternoon. We illustrated the building, which has been erected from the designs of Mr. William Hill, of Bolton, in our issue of Sept. 24, 1886.

The bust of the late Right Hon. John Bright, which, owing to railway delays, could not be unveiled, as arranged, by the Marquis of Ripon, at Rochdale Town-hall on Saturday, but has since been informally placed in position, has been executed by Mr. A. Bruce Joy.

For some months past litigation has been proceeding between Mr. W. C. Malton, the contractor for the construction of the Scarborough North Sea-wall and Promenade, and the Corporation, Mr. Malton claiming £7,603 for extras, in addition to the amount paid for extra work certified by the resident engineer. Subsequently when the claim was delivered the amount had been reduced to £6,353. Acting on legal advice, the Corporation paid into court £157 4s.; but the matter has been compromised by the Corporation agreeing to pay £1,000, in addition to the amount paid into court.

The foundation-stone of a new town hall was laid at Selby on Thursday in last week. The building is being erected from plans by Messrs. Thorpe and Sons, of Leeds.



The Poulton-cum-Seacombe School Board have decided to erect a school for 1,200 scholars. A large site has been obtained, and after an examination of six board schools by various architects, the board have chosen Mr. T. Mellard Reade, F.R.I.B.A., of Liverpool, as the architect for the school.

CHITECTURAL IMITATION AND COPYISTS.

VE hear a good-deal of one man copying another's ideas. Architects of all n are consummate plagiarists, and they re done nothing else for the last three ndred years but copy old buildings, good l bad. It comes, therefore, with a rather l grace for one architect to assert that *his* rk has been copied, when he himself has n doing probably the same thing ever ce he commenced to practise. But there copyists and copyists. Some can only ke a likeness, or do it badly,—so badly, eed, as to be nothing less than a travesty the original; others can make improved ies. Yet be the copy what it may, the n whose work is copied should rather eem it an honour than otherwise, for it ws, at least, that his work has been appre-ed. If the copy is bad it can do the ginal no harm—rather the reverse, by way ontrast. If it is an improvement on the ginal, its author can with equal satis-ion point to his work as the first, and some pleasure that his idea has borne d fruit, and what he might have done he another chance has been accomplished a way complimentary alike to the author the copyist. Therefore we take it that original artist has not so much to com-n of, any discredit attaching to the yist who has shown a want of inventive l, and who has not the ability to see r or where to improve upon the original. s for imitation, as we look back through great historic periods of art, has not every had its imitators, good or bad? How ch the golden age of Greek plastic art d to the preceding age of Pythagoras, of ron, or Calamis? How much of the at sculptures of Phidias and Polycleitus be traced to those early artists, and to at extent the great sculptor, Praxi-s, imitated his contemporary, Scopas, questions now of conjecture. Certain r of these great masters had their tators. Thus the copies of the Cnidian rodite of Praxiteles are numerous. The nan taste, fostered by the migration of ek artists, encouraged the copy of terpieces. Thus the temples, palaces, villas of Rome were filled with copies very school of Greek art, and, in fact, e are the sculptures that now fill the tinental galleries. But the Romans, ough they were copyists, modified the final ideas, and, to a certain extent, gave a character of individuality. In archi-ure the same imitation appears in the oduction of temples and details, as every ent is aware. The Greek temples them-es were more or less copies of one another, details such as those of the orders mouldings were replicas. Surely their itects were as much chargeable with ism of contemporary structures as itects are to-day. Cannot we also find nblances between the Romanesque and ntine structures? The plans and struc-of the Western basilicas were all formed e model, in the first instance copied pagan buildings, and afterwards made uit the requirements of the early rch. No hesitation was felt in repro-g the same arrangements of apse, bema, resbytery, and choir. The basilicas of eter and St. Paul, Rome, were very alike in design—as much alike as any modern churches could be. The great ch-building epoch of Mediæval Europe us equally remarkable instances of imitation. Many of our cathedral churches are alike. Their designers built on the same plan, and tried to improve on their earlier models as time went on. In essential principles of structure and arrangement they are the same, and only in detail and in style do we notice differences. But between these instances of imitation and the later examples of the age of copyism and reproduction proper of the 16th century, we notice one important distinction. In the first, modification and improvement were always apparent; while in the latter we find whole styles and details copied, and, of course, their faults as well. The idea of adaptation appears to have been completely lost in the desire to copy the outward forms. Forsaking "common sense," as Fergusson says, men forsook the principles on which this and other arts had been practised, and commenced to reproduce simply. Thus we find our own Metropolitan Cathedral of St. Paul's more or less a reproduction of that of St. Peter's. The earlier churches of the Renaissance in France exhibit the copying of Classic façades or Mediæval plans, and the same course was resorted to in all the more conspicuous examples. When the Classical revival followed in the 18th century, mechanical copyism reached its height. Mediæval plans and façades were set aside entirely for the Greek and Roman models. Our modern copyists are happily not imitators in this sense, or in the copying of Gothic buildings which followed. The Cinquo-Centist went back at least a thousand years, the Gothic revivalist from three to five hundred years for his models. They entirely ignored what had been done in the interval. It cannot be so servilely bad to imitate a modern building as one that is estranged from us by a period of five hundred or a thousand years. That was indeed copyism of the most slavish form, for architecture proper was really dead.

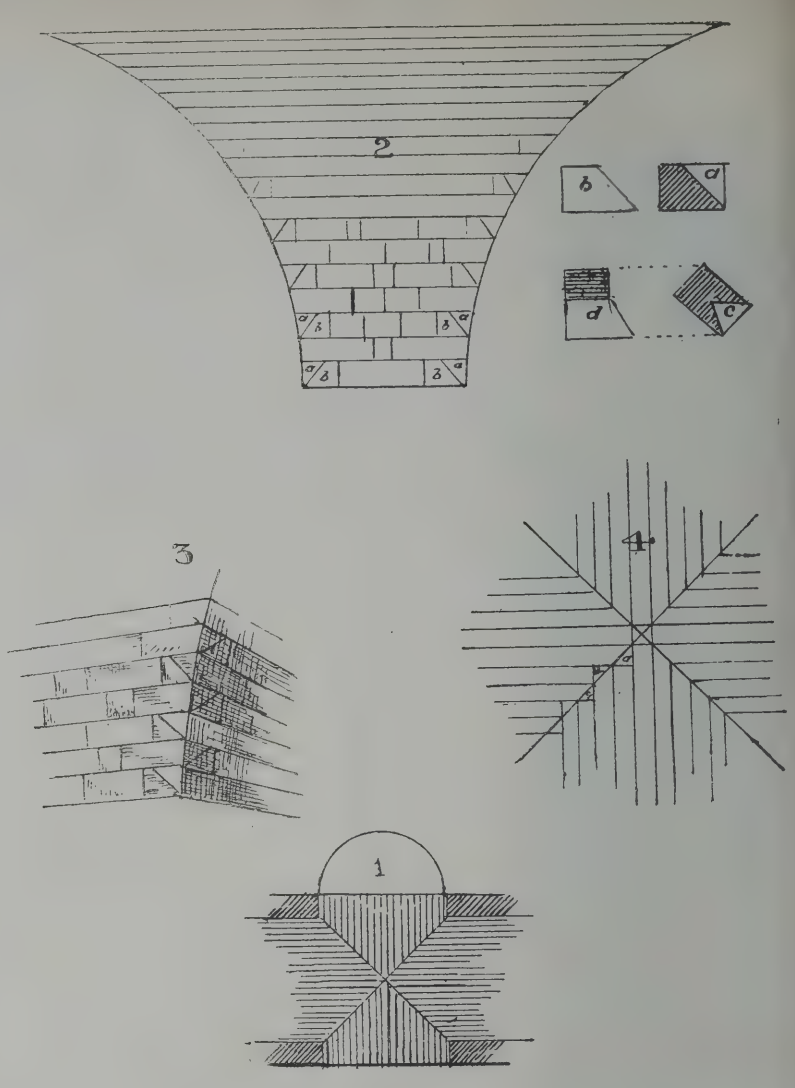
It appears ridiculous, therefore, to bring charges of copying against some architects of the present day when we have these records before us. Comparing the copyist of the early part of the present century with the imitator of to-day, we can only say that the latter is less a delinquent, he works within touch of his own time, and he selects a model that appears to him to meet the requirements. One practised a system of mechanical imitation without restraint, the other follows the earlier Renaissance artist in selecting and adapting a model for his purpose. There have always been weak as well as strong imitators; but imitation of some form there has always been, as one of the essential processes of a growing art. The most imaginative artist cannot be always inventing new forms or new styles, a truth painfully brought to our notice in many of the abortive attempts that have been made. Reasonable imitation has always been accompanied by variation, and successful imitators invariably evinced discretion in selecting their model or type, and in varying it to meet the circumstances. The gifted architect spurns the word "imitation," yet when he comes to think of it he is more or less engaged in imitating whenever he prepares a design; he adopts the conventions and types which suit him, he copies a feature here and a moulding or detail there; but he does so without becoming chargeable with mere copying. The highest kind of imitation has been said to imitate Nature—not what she presents, but her mode of operation. The true artist will not make a likeness, but discover that which is common to a certain class, and omit all that is peculiar to each. Thus the artist with the largest stock of ideas, who can select what he is in need of, is the most successful imitator. Sir Joshua Reynolds says he who "never ransacks any mind but his own will be soon reduced from mere barrenness to the poorest of all imitation; he will be obliged to imitate himself, and to repeat what he has before often repeated." We perceive it every day in designs made by men who have no materials to work upon, and, therefore, if they copy, they copy something unsuitable to the purpose. These are the weak copyists.

When we speak of originality in architecture, we generally mean a "new combination of images which have been previously gathered and deposited in the memory," to quote again the same author, for as he says, "he who has laid up no materials can produce no combination." The richly-stored mind of the architect who has retained what he has seen, and can rearrange and combine, can only copy in this sense. If he has to design a tower and spire, ideas of arrangement and grouping are suggested by models such as those of Salisbury Cathedral, St. Mary's, Oxford, Lichfield, or the plainer types of Stamford or Polebrook. Some of the late Sir G. Scott's most beautiful structures of this class are imitations, generalised, not literal, copies. To the uninitiated eye the likeness might be strong, but it is no stronger than when we say one tree resembles another, or one flower another of the same species.

There are two kinds of copyists besides the strong and the weak, those who copy and reproduce foreign examples and those who copy works at home. Our thoroughfares are filled with bits from Italy, France, Belgium, and Holland, about which nobody ever thinks of charging the architects with plagiarism, these designs being as much common property as quotations from Shakespeare or from Byron. On the contrary, those who copy a design recently carried out receive all the reproach and opprobrium arising from so contemptible a proceeding. It is characterised as "barefaced robbery"; "stealing the brains" of another artist, and other uncomplimentary epithets, are applied to the luckless copyist. The copy may consist of a front, or a gable, or a tower, or some other feature. Perhaps, after all, it is but a copy of a copy; the process of descent may be positively downwards, and, if we could compare the last repeat with the original, it would be seen there was a decided degeneration in the details and design.

The question, after all, is whether the repetition is a mere slavish reproduction of external form without a legitimate motive, or correspondence of plan and design, or whether the architect has selected the treatment because it best expressed his intention and purpose, as an author would not scruple to borrow a sentence from a great writer which expressed his meaning. An architect can, of course, register his designs, or "patent" any arrangement he pleases, if he thinks fit, but this is not resorted to very often; indeed, it would not be so easy to discover the limits of invention in design of this sort. As we have said, the disgrace of a bad copy falls upon its perpetrator; he alone is responsible for the folly or the unsuitableness of the design he has adopted, and if he drags in a feature from another building which has no apparent connection or agreement with his own, he commits a flagrant mistake which cannot be justified. It is this sort of copyism which has reflected so injuriously on architects and the art they profess. Those who wished to read history and development in buildings were shocked to find Greek porticoes tacked on to 19th-century churches and town halls, 13th and 14th century details used for modern Gothic villas, and even Romanesque adapted after eight centuries of disuse. This was a flagrant falsification of style. It is quite as dishonest to copy a circular stair turret as a mere ornament, a loggia in a façade when it has no meaning, or a gabled front without reference to any internal division of a building. The copy of Queen Anne, Jacobean, and Georgian features, such as gables, windows,

doors, chimneys, &c., has been carried to a degree which prompts us to ask whether there is anything in those features which admit of repetition in our modern buildings. The revival of brickwork is one of the reasons for imitating those styles, and as far as the treatment of this material is concerned there has been justification. But copyism has gone farther than this for the sake of picturesqueness. Few contemporary architects have been more copied and travestied in those styles than Mr. Norman Shaw and Messrs. George and Peto. They have imitated older work, their disciples have copied them, till we find replicas of gable ends, chimney shafts, oriels, chimney-pieces, and interior details in every house in the suburbs. Nor will the tide of copyism in art ever be arrested by any restrictive measures. There will always be those who live by repeating what others have done, well or ill. Progress and development in architecture have been accomplished by continued repetitions, with such modifications as time and circumstances have dictated, but only the few can discern an improvement and set the example of a new type.



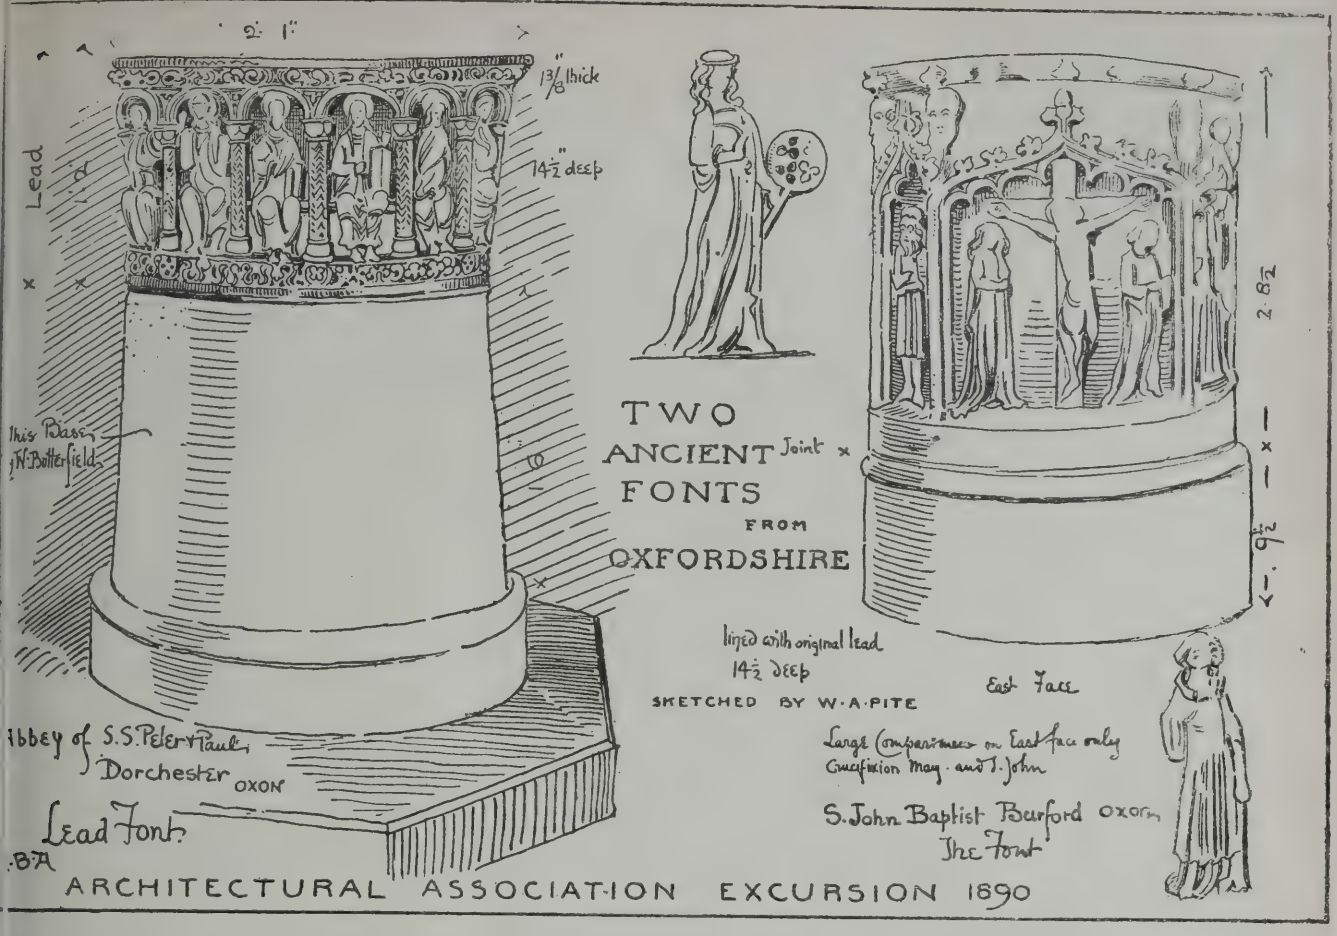
ARCHITECTURAL BRICKWORK.—XXXVII.

GROINED VAULTING.

THIS forms a distinct and more advanced branch of the brick-cutter's art. It is needless here to describe what a groined vault is, as everyone knows that if two cylindrical vaults intersect, the lines of intersection are ellipses, and these form the groins of the semi-vaults. In the execution of these groins considerable care is required in cutting the bricks, to which subject we shall only generally allude here; but we recommend the student to study the subject in a practical manner by the use of models or by attending the lectures in a technical school. Let us suppose Fig. 1 to represent the plan of a groined vault showing the intersection of two arches of equal width. The principal points to which attention are to be directed are the inverted ridges of the groin, or those angles on the underside of vault where the intersection takes place. The bricks are cut to fit the hollow formed by the centring of the arches, in a manner that will avoid a mitre, which would be formed if they were cut diagonally. Such a mitre joint would be weak, as the edges of the bricks would be apt to break off, and the groin lines or arrises would be imperfect. On this account it is necessary to lay the bricks at the angles of groin to overlap each other, as in ordinary bond—that is, as headers and stretchers.

CUTTING.

We will here quote Col. Pasley's remarks on the mode of cutting the ends of those bricks which show as headers in alternate courses. They are cut in three different ways. "1st. They are cut to the proper angle of the groin, so that whilst one side of them rests on the woodwork of one centre, without cutting, the end of them is made to fit the other centre, and enter closely into the hollow between. 2nd. In the lower part of the groin, until within about 45° of the crown of the arch, the back or under side of the heading brick is cut away for about half its original length, in order that the next brick which meets it at right angles may be notched into it. The notch is usually in the form of a trapezoid or triangle, and the brick fitting into it is usually a closer, which naturally assumes the form of a trapezoid. 3rd. As all the arch bricks on both sides are necessarily inclined at the top, so that the natural tendency of the courses is to meet each other like two slopes of a glacis, the upper part of the end of each brick which appears as a header on one side of a groin is cut off so as to agree with the slope or level of that particular side until it meets the other slope in the direction of the ridge."



These observations will be more clearly illustrated by referring to the figures. Cut 2 represents an elevation of the arch between two groins formed by a pier or two intersecting arches. It will be noticed that every alternate header is notched in the way described, and forms a triangle, *a*, *a*, while the closer next to it, *b*, is trapezoidal in shape. The diagrams of the bricks on the right side, the letters *a* and *b* corresponding, show the form of the headers at the lower part of groin or arch. Thus the header *a* has its lower portion cut away in the form of the shading in the figure to fit the trapezoidal closer *b*. In this manner the stretchers of alternate courses notch into the return side of groin, and form headers thereon. The bricks higher up on the groin assume the form of Figs. *c* and *d*. The header *c* is triangular, but less of the lower part is cut off; the top of the adjoining closer *d* is cut to correspond with the slope of the header course as shown, If the reader imagines the header *c* and the closer *d* placed close together, it will be seen how the notching in this part of the groin is formed. Higher up still on the groin the under part of the header is cut off to a less extent, as it then begins to agree with the angle of the voussoir.

STRENGTH OF GROIN BRICKS.

Colonel Pasley very justly doubts the strength of this mode of cutting, which has been adopted by bricklayers more for the sake of appearance than for any other reason. The closers are small pieces cut to the trapezoidal shape, and are placed with their largest end downwards; therefore it is only the pressure and the mortar that retain th in their place. They add little to strength of the arch because of their sh and the manner the header is cut for th Thus the inside end of closer, instead of b square, is rounded, this being the f best suited in cutting the end of the n in the header in a material like brick. 3 shows the appearance of a groin cu the manner described; while Fig. 4 sh on the plan the overlapping of e alternate course in the groin, as at *a*, *b*,

VALUE OF MODELS.

The student who has followed our rem thus far will have come to the conclu that the only satisfactory manner of lear the mode of cutting and bonding groin b is by the use of models. The proper for model would be "centres" intersecting another in the manner of the actual ar but to a smaller size. These may be in cut out of a solid piece of wood. Al joints of the courses would be drawn on centre. Small blocks of wood represe the proportions of bricks then being pared, the student would be able to tes real understanding of the mode of not and cutting the alternate courses at the g By putting together the bricks, the st would learn more of the requirements cutters' art in half an hour than he wou several days by the perusal of treatises diagrams, the most unsatisfactory mo learning anything in which solids and c surfaces, like those of groins, are conce In masonry the problem of groining is simple, as the lines are formed by geome methods, and the stones cut to m worked from the lines. The groin ston larger solids, and both sides or faces groin, together with the angle of groi

ut of one block of stone, the ends being t right angles. Thus all notching and ng off the angles of headers are dispensed .

HITECTURAL ASSOCIATION EXCURSION INTO OXFORDSHIRE.—II.

[TH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

ONDAY'S proceedings, devoted to the inspection of several of the old and new e buildings and schools in Oxford itself, most instructive, while the weather was all could be desired. To epitomise the hisl and archæological wealth of such a city as d is practically an impossibility, and the available here for such a synopsis, when uch could be said, is far too limited to t even an attempt in this direction with any e of success. We have, however, frely described at some length many of the ersity buildings, and no journal has more natically illustrated the new buildings in wn and additions to the colleges than the DING NEWS. There is scarcely a work of importance in Oxford, erected in recent , of which drawings have not appeared in pages. The foot-note at the end of this nt of the excursion will indicate some of ore noteworthy illustrations which we have lately published.

e first buildings seen on Monday were those *rist Church*, naturally the most important ectural group in Oxford. Founded by Car- Wolsey, this vast academic institution ped into one of the grandest and most guished colleges which England has ever Sir Christopher Wren's world-famous n" Tower (1682), built over the principal nce to the great Quad; the hall, the largest inest in the city, built by Wolsey and ed by him in 1529; and the cathedral, the distinguished Cardinal converted into ollege chapel, form its leading features. is no better piece of work in the whole of d than the new Belfry Tower in the angle rist Church Quad, over the great staircase, "one Smith of London built" (in Late r times), leading up to the great hall. This was designed by Messrs. Bodley and er (illustrated in BUILDING NEWS, June 27, 1879), and the tone which a few years have given to this masterpiece has enhanced its beauty. The work which Sir Gilbert Scott did in the cathedral has unfortunately not improved correspondingly. The reredos in red Dumfries stone, with dull, polished Rosso Antico statues in the niches, which Mr. Bodley erected five years ago, at the back of the high altar in the cathedral, is a very successful composition, and the side hangings in green velvet, embroidered with blue and gold thread, are exceedingly effective. The frontal was executed by the dean's daughters. The silver gilt candlesticks and the alms dish (1660-61) are particularly good specimens of metal-work, and the mountings to the altar books (1638) are equally delicate in detail. A new font in Rosso Antico has been added in the south transept in St. Lucy's Chapel, and Mr. Burne Jones's windows at the east end, north of the choir, are worth seeing again and again. The best carving of old date in the church is on the shrine of St. Frideswide. The pulpit in the Latin Chapel we shall illustrate by a detailed sketch next week, drawn by Mr. Thomas MacLaren. We shall also publish a view of the choir, showing Wolsey's fan vaulting, drawn by Mr. Phené Spiers, F.S.A. The Jacobean pulpit in the nave is very rich and handsome. The screen at the west end of like character was illustrated in the A.A. Sketchbook, Vol. VII., new series. After seeing the kitchen, cloisters, chapter house, the library and pictures, the party passed Peckwater Quad, with its coarse Classic detail, and reached Merton College, noting Mr. T. G. Jackson's new buildings lately erected for Corpus Christi College. The façade is very good, of course, but the ground arcade arches set rather uncomfortably on their caps, which look crude with the chamfer moulding below and orders to the arches above.

Merton College has a noble chapel formed by the enlarged choir, central tower, and transepts of the once parish church of St. John, which stood on its site originally. Walter de Merton, its founder, lived to see the dedication of the high altar in 1276. The chapel, restored by Blore in 1838, and since done up by Mr. Butterfield, the roof being painted by Mr. J. H. Pollen in a curious style, contains some fine old glass, a grand lectern in brass of 15th century date, and two good monumental brasses. The sacristy, till lately used as a brewery, has just been repaired, and fitted with hardwood cases for the college MSS. by Mr. Jackson. The windows to this building are beautiful specimens of Decorated work, and the opening looking into the sacrarium at the rear of the sedilia in the chapel is unusual rather. The library at Merton College, with its ancient Jacobean fittings, old plaster mural work, and original coloured glass, is the best of its kind in the city. The hall was spoiled by Wyatt, and not much improved by a subsequent restoration, but three years ago some good decorations were done in it. The original 13th century iron hinges of elaborate character remain on the ancient entrance-door. Mr. Butterfield's new wing, added some years ago, is a most uncomfortable and unsuitable piece of design, and one wonders how so competent an architect could produce such a poor façade.

Magdalen College formed the next group of buildings to be seen, and Messrs. Bodley and Garner's new gateway and range of buildings were deservedly admired. The want of harmony in the scale of some of the parts is conspicuous here and there, more particularly on the High Street front; for instance, the caps to the wall piers under the corbels of the oriels have the most minute crestings, while almost immediately in juxtaposition the embattled sills are quite unusually coarse and heavy. The carvings on these buildings are excellent. The Magdalen tower is too familiar a feature to be described; its upper stage was restored a year or two since, and has been well done.

New College was reached after leaving Magdalen, and here we fancy Mr. Jackson has been at work in the chapel, adding canopies to the seats on either side of the sacrarium. The cloisters with their arch-ribbed roofs are being stripped of their tiles for renovation. The hall, approached through the second tower, is the most ancient one in Oxford, and is built almost above the old city wall. The panelling is rather good, and the hall contains several interesting portraits. Sir Gilbert Scott re-roofed it some years ago, and he built the long range of students' lodgings in the slype overlooking Holywell-street. This block is correct and solid, but devoid of interest. Views of New College will be found in the A. A. Sketch-book, Vols. II. and III., new series (1882). Walking now from New to Wadham College, the party passed Mr. Basil Champneys' Indian Institute (illustrated in BUILDING NEWS, February 27, 1885)

a building of great merit, with an originally-treated angle tower, well designed at the top, the whole piece of work harmonising well with the reposeful architecture of Oxford. Some of the ornament enriching seems to look stuck on, and there is a lack of true beauty in some of the animal carvings.

At *Wadham*, the hall, like the rest of the college, built by Nicholas Wadham in 1613, is hardly in a pure style, but there are some good pictures in it for those who like portraits. The chapel is much more worthy of note, with a "Free Classic" brass lectern with an eagle of ugly shape upon it, but with the feathers charmingly treated in detail (illustrated in Building News, June 4, 1886). The black and white marble check-board steps are very unhappy in effect in front of the altar. This chapel has transepts like several others in the University, with arcades dividing off the wings very prettily, and a wide arch over the rich chapel screen at the west end, which is very effective. Mr. T. G. Jackson restored the chapel and added a good organ in the ante chapel. It is a trifle flat in the upper part, but is a first-rate piece of work. The gardens at Wadham are very secluded and beautiful, with some fine cedars.

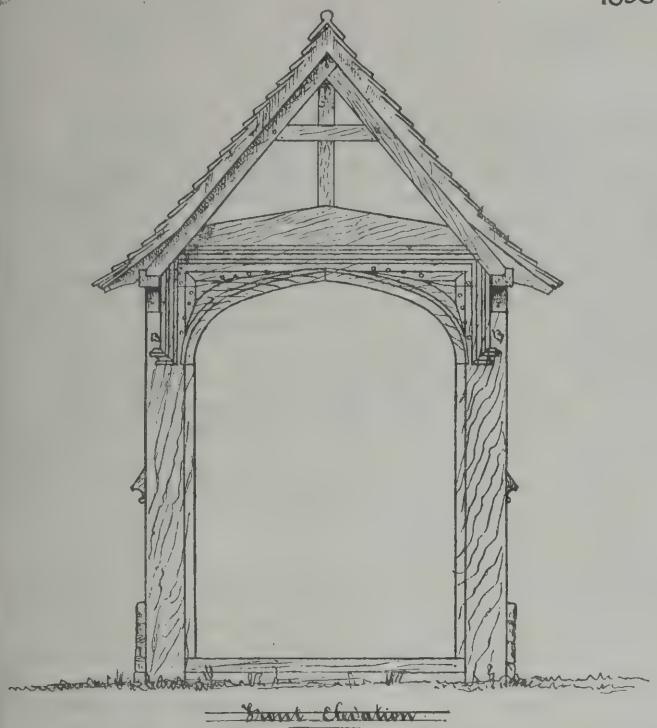
Retracing their steps past the Radcliffe Library and St. Mary's in the High-street, the excursionists proceeded to view Mr. T. G. Jackson's great work—the Examination Schools in the High-street (illustrated in the Building News, June 27, 1879), and there can be no doubt as to the thoroughness with which his modern group of buildings has been carried out. It is, on the whole, one of the more satisfactory compositions in Oxford, showing individuality in all its details, some of which remind us of Kirby Hall and other similar old examples, but there is a good character in the work which very few architects are able to insure. It is unfortunate that even already the stonework should be perishing. We refer to the cornice in the quad, on the face of the first chimney projection, where the work is crumbling away. This is the misfortune of almost all the old buildings in Oxford, giving them a gloomy and heavy effect sad to behold. Refacing is going on everywhere, and for many years will furnish work for the mason. The after part of the day was spent in sketching or in visiting other colleges. The Mansfield College, at the back of Holywell, an extensive new work by Mr. Basil Champneys, is a theological school erected by the Nonconformists, and after carefully inspecting the building, we can speak in no measured terms of its merits. The design is thoroughly good as a piece of building, artistically treated, well proportioned, and full of character and go.

The weather on Tuesday was most propitious for the holiday outing, when the first halt of the drags was made at *Iffley*, where the church was seen. It was built by Dame Juliana de Sancto Remigio, and given to Kenilworth Priory about 1160. The building is one of the most familiar specimens of Anglo-Norman architecture in the country. Its chief interest centres in the original west front, which is characteristically rich, with a portal elaborated with emblems of the zodiac introduced in the arch mouldings. Buckler, the well-known architect, restored it many years ago. The chancel arch has an unusual treatment of large sunflower-like carvings along the moulding. The chancel is Early English, but on the south side is a blocked-up doorway, which if opened through the wall would cut into a triple sedilia inside.

A view of Iffley Church was the subject of a double-page illustration in the Building News for Jan. 23, 1874. Another view will be found in the A.A. Sketchbook (old series), Vol. VI. The so-called buttery hatch in the rectory-house hard by, with the ornamental pillar dividing the opening, is rich in detail, and curious, and worthy of a note, but it is not at all likely to have been originally used for this purpose. Most probably it was a piscina, or it may be a make-up. The church is admirably kept. A smart drive of about an hour through a very pretty part of the county brought the Associationists to *Dorchester* Abbey Church, which stands near the confluence of the Thame and the Thames. Its history dates from the foundation of St. Birinus, who dedicated his building in the 17th century to SS. Peter and Paul, and made Dorchester an episcopal see. Remigius, after the Conquest, removed the chair to Lincoln in 1086. Before this, Dorchester was the largest see in all England, comprising the present dioceses of Winchester, Salisbury, Oxford, Lichfield, and Worcester. The church is an exceptionally long one (measuring 300ft.) as compared with its width. The entire structure has been restored, except the Chantry Chapel to the N. side of the N. aisle to the chancel. We gave a plan last week in the Building News. The church was bought by Richard Bewforest at the Dissolution for £140, and bequeathed to the parish by him in 1554. Its dates are various; but it was chiefly between 1280-1300. The Western Tower, the whole width of the nave, was re-erected in Charles II.'s reign, with the old material of the earlier Tudor work. The south aisle is unusually wide, and contains the monument of an abbot. Sir G. G. Scott restored the S.E. chapel in 1874, and Mr. Wm. Butterfield restored the church in other parts, and the late J. M. Bignell renovated the remainder at the east end, beginning with the reredos. The chancel is the most remarkable portion of this grand building. The east window, of Late Decorated character, is filled nearly entirely with tracery, and has sculptures in it representing the Life of the Saviour, and local traditions, such as St. Birinus converting Cynegds; St. Oswald, his sponsor, &c., carved in high relief. The Jesse window on the north side (1328) is, of course, very famous (see illustration), with the genealogical tree bearing figures, having its stem on the central mullion springing from the loins of the Patriarch Jesse, who reclines at the base. The lateral tracery represents the branches, and on each is a statuette of one of the House of David. The stained glass enters, too, into the scheme of the design. The font is a Norman lead bowl, moulded with eleven figures of the Apostles, draped in Byzantine folds, introduced in arched niches. It is raised on a plain circular base by Mr. Butterfield, and is a very rare, rich piece of old work. We illustrate it to-day. The brasses, though broken mostly, are numerous and interesting. Among them is that of Sir Richard Beauforest, abbot, 1510, tonsured and holding a pastoral staff. Out of his mouth proceeds the mutilated ejaculation, "— Virgo Virginum ora pro nobis tuum filium," and at his feet the couplet:—

Here Lyeth Sir Richard Bewfforeste: I
pray Jh'u geve his sowle good reste.

The sepulchral slab, enriched with the following inscription in Lombardic capitals, once covered the mortal remains of Abbot John de Sutton, of Dorchester (1333—1349):—



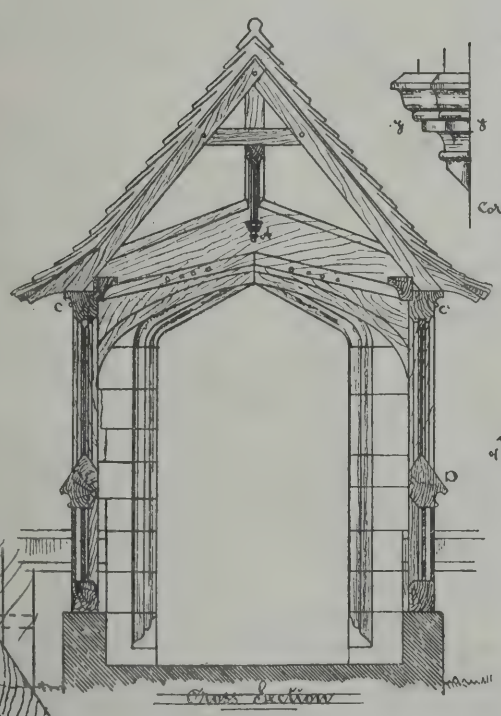
ABBATS : GESSIT : VICES : HIC : QUI :
REQUIESCIT : JO : HAN : DE : SUTTONA :
DICTUS : QUEM : CRISTE : CORONA.

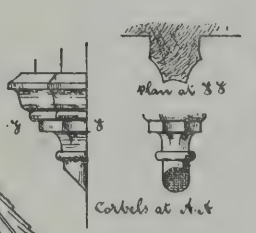
Chief Justice John de Stonore, who died 1354, has an effigy in legal costume, and on the north side is a handsome Tudor altar tomb, dated 1400, to a Segrave, surmounted by a knight in plate armour. A drawing of the doorway to this church will be found in the A.A. Sketchbook (new series), Vol. VII. The projecting corbel on the nave pier, which furnished so much speculation as to its intended use, is illustrated herewith to-day, and also the angle door leading to the roof turret in the S.E. chapel by the side of the piscina. There are two side chapels in use at this church, and the building is remarkably well cared for and served. The restored cross in the churchyard is a good one, and so is the massively constructed oak lych gate.

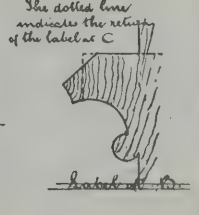
The last place seen on Tuesday was Ewelme, with its church, hospital, and grammar school, all built adjoining, and thus forming one charming group rising each above the other in picturesque order. We shall give a complete plan next week of the whole set of buildings, copied from that drawn by Mr. F. T. Dollman in his "Analysis of Domestic Architecture." The church is said to be a sister building to that of Wingfield, in Suffolk, and both were built by the Wingfields. Between the chapel of St. John and the chancel is the tomb of Alice, the foundress of the hospital and church, the Duchess of Suffolk, granddaughter of Geoffrey Chaucer, and widow of William de la Pole, Duke of Suffolk, who was beheaded at sea off Dover. The effigy is one of three known examples of females decorated with the insignia of the Order of the Garter. Beneath is an alabaster skeleton figure surrounded by curiously-feathered statues of angels with Greek-like faces bearing heraldic shields of the De la Poles. The sacred building is said to have been preserved by a local landowner from the desecrations of Cromwell's soldiers and agents of demolition employed by the Puritans, so that thi tomb and the figure ornamentations generally c the church are uncommonly perfect. There ar no less than fourteen brasses in the building The church, with its square western tower, is a exceedingly fine specimen of the Perpendicula period chiefly, and it contains a magnificer carved timber ceiling in the St. John's Chapel an elaborate tabernacle cover to the font, an good roofs. "God's house," as the hospital c almshouses were called, founded by Dame Alic are of Early brickwork, with a timber cloiste over which rise a series of rich quaint dormers t the upper rooms, elaborated with good barg boards, like Leicester's Hospital at Warwick The plan, which we shall give, shows th arrangements of the rooms, which provid accommodation for thirteen old men, who ar presided over by the venerable Sir Henr Acland, Bart. The school-house is of stone, an accords with the other buildings. We illustrat the south porch of the church to-day fro measured drawings by Mr. Walter L. Spier A.R.I.B.A.

Stanton Harcourt, an hour's drive from Oxfor was the first place visited on Wednesday. Th church, dedicated to St. Michael, is cruciform with a 12th-century nave and chancel of the da of Henry III., with a triple lancet at the ea end like those on the north side. On the sout of the chancel is the Harcourt Chapel, erected i the time of Henry VII., when the mansio adjoining the churchyard was built. The ais is a specimen of debased Tudor work, with a open quatrefoil parapet and square - toppe pinnacles. It is filled with Harcourt tombs, an has large windows of Perpendicular characte We give herewith a sketch of the church, with plan from the note-book of Mr. Wm. A. Pit The screen to the chancel is a unique example Early English oak-work, contemporary with th arch which incloses it. The mouldings of th masonry and woodwork exactly correspond. Th two side compartments are each filled with fo cusped arches, divided by turned columns havi caps and bases, and the doors, which are hun folding, have each two similar arches of small proportions. The lock is original also, a worthy of remark. This screen is the earlie wooden one in England. The manor of Stant Harcourt has been for six hundred years th property of the Harcourts. In the chancel the church is a rich altar tomb (see Buildi News, August 14, 1885), with a beautiful cano over it, carved and emblazoned with arms, whi prove it to have been erected to commemora some person of this ancient family. It is believ to have been erected to Isabel, daughter a heiress of Richard de Camville. She marri Robert de Harcourt, and died in the days Edward I. There is no reason to doubt that th structure was used as an Easter sepulchre. the north transept, on a small, round, blue marb inserted in the pavement, is a brass curious illustrating the way in which the arms of Be and Harcourt were united. We give a diagra on one of our lithographic plates to-day showi this, under the view of the kitchen at Stant Harcourt. Sir Richard de Harcourt, son William and Hilaria, daughter of Henry, Lo Hastings, married Margaret, daughter a heiress of John, Lord Beke, of Eresby, wh arms were divided between Sir Robert Willoughby and Sir John de Harcourt; and t above-mentioned stone is probably in memo of Sir Richard Harcourt and Margaret Bek he died 1330. Congreve wrote the epita on a tablet on the outside of the chur on the south wall to the memory of two lov killed by lightning. The front of porter's lod to the manor house road remains in its origi unaltered form. In the house the princi apartments were the great hall, the great s little parlour, the Queen's chamber (so cal from its having been occupied by Elizabe Queen of Bohemia, when she made a visit he with other chambers, which filled the sp between the domestic chapel on the ground fl of the Pope's tower and the kitchen. Th remained entire until the end of the last centu The kitchen, of which we give a sketch to-d taken from the high road, together with a grou plan and two other views, bears some rese blance to the Abbot's kitchen at Glastonbu though it differs in many particulars, the la being an octagon on plan inclosed within square, whereas this is square inside as well out. The upper part, however, is octago with squinces across the angles carrying

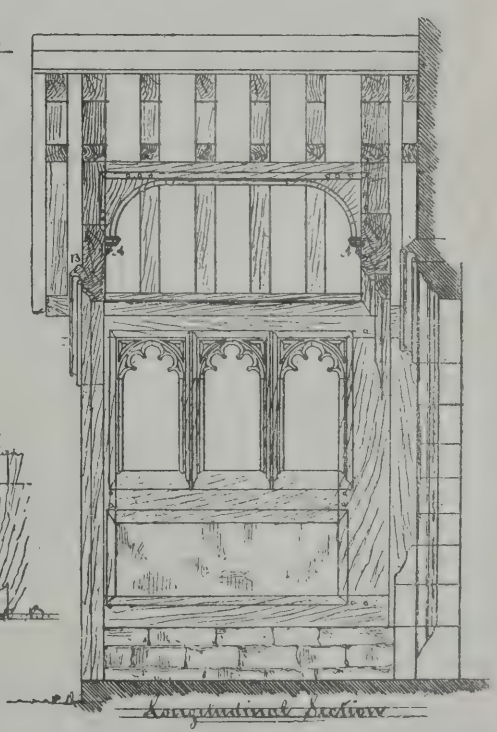
ARCHITECTURAL ASSOCIATION EXCURSION 1890



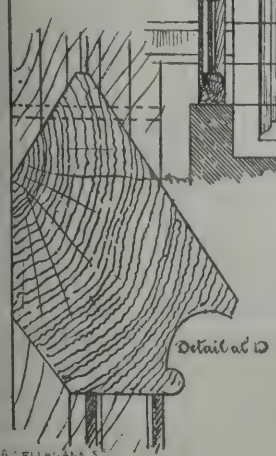


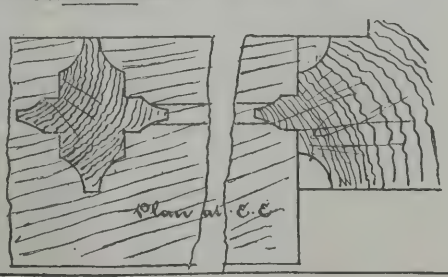


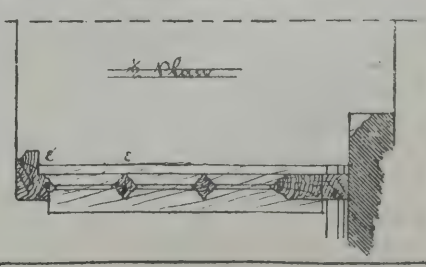
EWELME CHURCH OXON — SOUTH PORCH



MEASURED & DRAWN BY WALTER L. SPIERS A.R.I.B.A







lantern, the eaves of which are seen in our view just level with the top of the parapet. There is no chimney, and the newel staircase in the angle turret leads to the passage round the battlement. The octagon lantern was fitted with shutters to give vent to the smoke according to the quarter from whence the wind blew. The cooking was done by "dogs" on the hearth, in the middle of the kitchen mostly. Inside the timbers are perfectly black, and the place has long been used as a wood store. The height of the walls to the bottom of the roof (which in the centre rises 25ft. more) is 39ft., and the griffin, bearing the Harcourt arms, on the point of the cone forming the finial, is 8ft. high. On plan the building measures from east to west 33ft., and from north to south 31ft. This was built in the reign of Edward IV., and the Glastonbury kitchen was erected as late as the days of Henry VIII. A short distance from the church at Fontevrault in France is another rare kitchen of earlier date still, probably the 12th century. It more closely resembles the Glastonbury one, and is octagonal, with circular apses projecting on either side. In the Vol. VII. (old series) of the A.A. Sketch-book and last volume of the R.I.B.A. *Transactions* some sketches of the building were given by Mr. Wm. A. Pite. In Parker's "Domestic Architecture" some drawings are given, and in J. M. Derick's Monograph of Stanton Harcourt, published by Parker in 1846, some plans will be found of the church. The domestic chapel and the chamber over it, and the tower containing three rooms one over the other, and each 13ft. square, remain in good repair. The uppermost one retains the name of Pope's study. Here Alexander Pope finished the fifth volume of Homer, 1718.

Witney, on the river Windrush (and once called Witaneye), was celebrated in Saxon times as the seat of the Witan who sat in council with the king. The church, of which we print a plan with this, is enriched by one of the finest spires in the county, which rises from a Late Transitional tower (1220-30) placed at the crossing, with eight bells in it. The spire lights are of exquisite design, and the angle turrets, contemporary with the Early English spire, are thought by some to resemble like work at Bayeux. At least ten altars can be shown to have existed in this church, and some ancient reredoses are still *in situ*. The building inside is exceedingly roomy, and may be described as of vast extent as compared with the size of the town. The nave arcade has no capitals, like the capless arcades at Coggs and Cropredy. We shall give an elevation of the former example next week, and at the same time a plan of St. Mary's at Witney. Elevations and details of the tower and spire will be found in *Transactions* of the R.I.B.A. for 1884, drawn by Mr. W. A. Pite in his report as Pugin student. The north porch is a work of various periods, from the 12th to the 15th century, and among other details of interest about it, besides the monk's room above the doorway, is a carving of the chase illustrative of the sports of Wychwood Forest. This church, which measures the same length across the transepts as it does from east of the chancel to the west end of the nave, was known as the "Cathedral of Wychwood." The stone of which the fabric is constructed is particularly hard, and came from Tainton, also on the Windrush, six hundred years ago. The sharp angles of the masonry show what a splendid weathering stone was used. Beneath the end of the north transept was a crypt, and immediately under the great window are two traceried recesses with recumbent figures in them about 12ft. from the floor of the transept. Remains of the undercroft springers and windows may still be seen in the walls. Five bishops have come from Witney, as may be seen from the list of the incumbents from the earliest times, which the present rector, the Rev. W. Foxley Norris, has compiled and hung up on vellum in the porch. Mr. G. E. Street restored the building. The market cross stands in the centre of the main street, and is rather picturesque, with its tiled roof. The building was put up about the close of Charles II.'s reign. The old "College" belonging to Corpus Christi College is recorded as having been erected as a refuge for the students during the great Plague which prevailed in this district. The deserted hall of the old Blanket-makers' Company was built in 1721. The manufacture of blankets, for which Witney had a name, has gone down—that is to say, the seat of this industry has been removed to the North of England. The old proverb says that "Witney was celebrated for four B's—Beauty, Bread, Beer, and Blankets." The Grammar School at the end of the avenue of trees is very French in feeling, like some of the old houses at Burford, and deserves more than a passing note.

Coggs Church, the last place down on Wednesday's programme, is situated on the outskirts of Witney, and stands adjoining the old Manor-house there, which contains some highly-interesting Early English windows on the front next the garden, with the original shutter fastenings (see Parker's "Domestic Architecture," Vol. I., p. 161, for illustrations). The house was rebuilt during the Elizabethan period, and has many more recent alterations about it. The property belonged to the Greys, of Rotherfield, and was the gift of Walter de Grey, Archbishop of York. At the west end of the church is an anglewise set turret or tower of singular character, of the Decorated period, with a timber-built upper stage plastered over, and the basement opening out into the north aisle by an archway. Outside is a staircase leading up to the ringing stage. We to-day give some details of this structure with the several floors, and other particulars, as well as a plan of the church and drawing of the altar tomb, with the recumbent female figure which stands between the chantry chapel and the chancel. It is supposed to be in memory of one of the De Greys. The piscina on the east respond of the arcade over the tomb is a most interesting piece of detail. The arcade itself is a very good piece of work. Last week we illustrated Burford Church (Thursday, for which day Asthall was included in the programme). We illustrate a view of the Church and Manor-house there to-day, and also the font from Burford. Next week we shall conclude our account of the excursion, accompanying our notes with several other illustrations.

The following illustrations of Oxford and neighbourhood have already appeared in our pages on the dates given:—Tutor's Lodgings, University College, H. Wilkinson Moore, architect, October 11, 1889; Keble College Chapel, Wm. Butterfield, architect, October 18, 1889; Brasenose College, New Front, T. G. Jackson, M.A., architect, May 11, 1888; Pusey Memorial House, H. W. Moore, architect, December 14, 1888; Trinity College, New Quad, and President's House, T. G. Jackson, M.A., architect, July 1, 1887; Lincoln College, additions to rector's lodgings, H. W. Moore, architect, October 8, 1886; Statue of John Hunter, University Museum, H. R. Pinker, July 2, 1886; Corpus Christi College, New Building, T. G. Jackson, M.A., architect, June 4, 1886; Brass Lectern, Wadham College, June 4, 1886; New Quad, Trinity College, T. G. Codd, March 19, 1880; Old House in "The High," sketched by W. H. Moore, March 12, 1880; Post Office, E. G. Rivers, architect, August 22, 1879; Interior of Hall, Examination Schools, T. G. Jackson, June 27, 1879; New Belfry, Christ Church, Messrs. Bodley and Garner, June 27, 1879.

REGISTRATION OF SCOTCH PLUMBERS.

THE Congress in connection with the National Registration of Plumbers of Scotland concluded its proceedings at Edinburgh on Friday, Mr. A. M. Scott, Glasgow, presiding until noon, when Professor Crum Brown took the chair. A long discussion was caused by the question, "What are the best means for promoting technical classes for plumbers; and is a graduated scheme of trade education feasible or desirable?" Mr. W. R. E. Coles, London, described the graded syllabus of instruction in the principles and practice of plumbing prepared by the Worshipful Company of Plumbers, of which he is the secretary. It was generally agreed that some graded system similar to that described should be adopted, but that practical should be associated with theoretical instruction. The difficulty of reaching outlying districts, so as to give instruction to registered plumbers and their employés, was discussed, and it was suggested that peripatetic lecturers should be engaged to lecture and demonstrate in the small centres of population. Another and more important difficulty lay in the ability of masters wishing to benefit their apprentices to compel attendance on a course of lectures, but Mr. Coles stated that the Company had under consideration the drafting of a model indenture which should identify the systematic training of the apprentice with the conditions of his apprenticeship. The following resolution was adopted:—"We are agreed that graduated scheme of trade education is feasible and desirable, and this meeting recognises (1) that workshop practice should form part of any scheme of education; (2) we recommend the scheme of the Worshipful Company for the consideration of district councils; (3) we recommend that all apprentices should be indentured; and (4) that the masters should interest themselves in the education of their apprentices." A long discussion took place on the question whether it was desirable to have a central board in Scotland for the management of Scottish business. The feeling generally was against the suggestion, and a resolution was ultimately adopted to the effect that it was desirable to have a yearly conference in Scotland for the discussion of Scottish business. Glasgow was adopted as the meeting place for the next congress

CHIPS.

A contemporary announces the very serious illness of Mr. H. Lovegrove, of Budge-row, but we are glad to state that he is perfectly well. His son, Gilbert Henry, met with a serious accident recently, but is now nearly well. Hence the mistake.

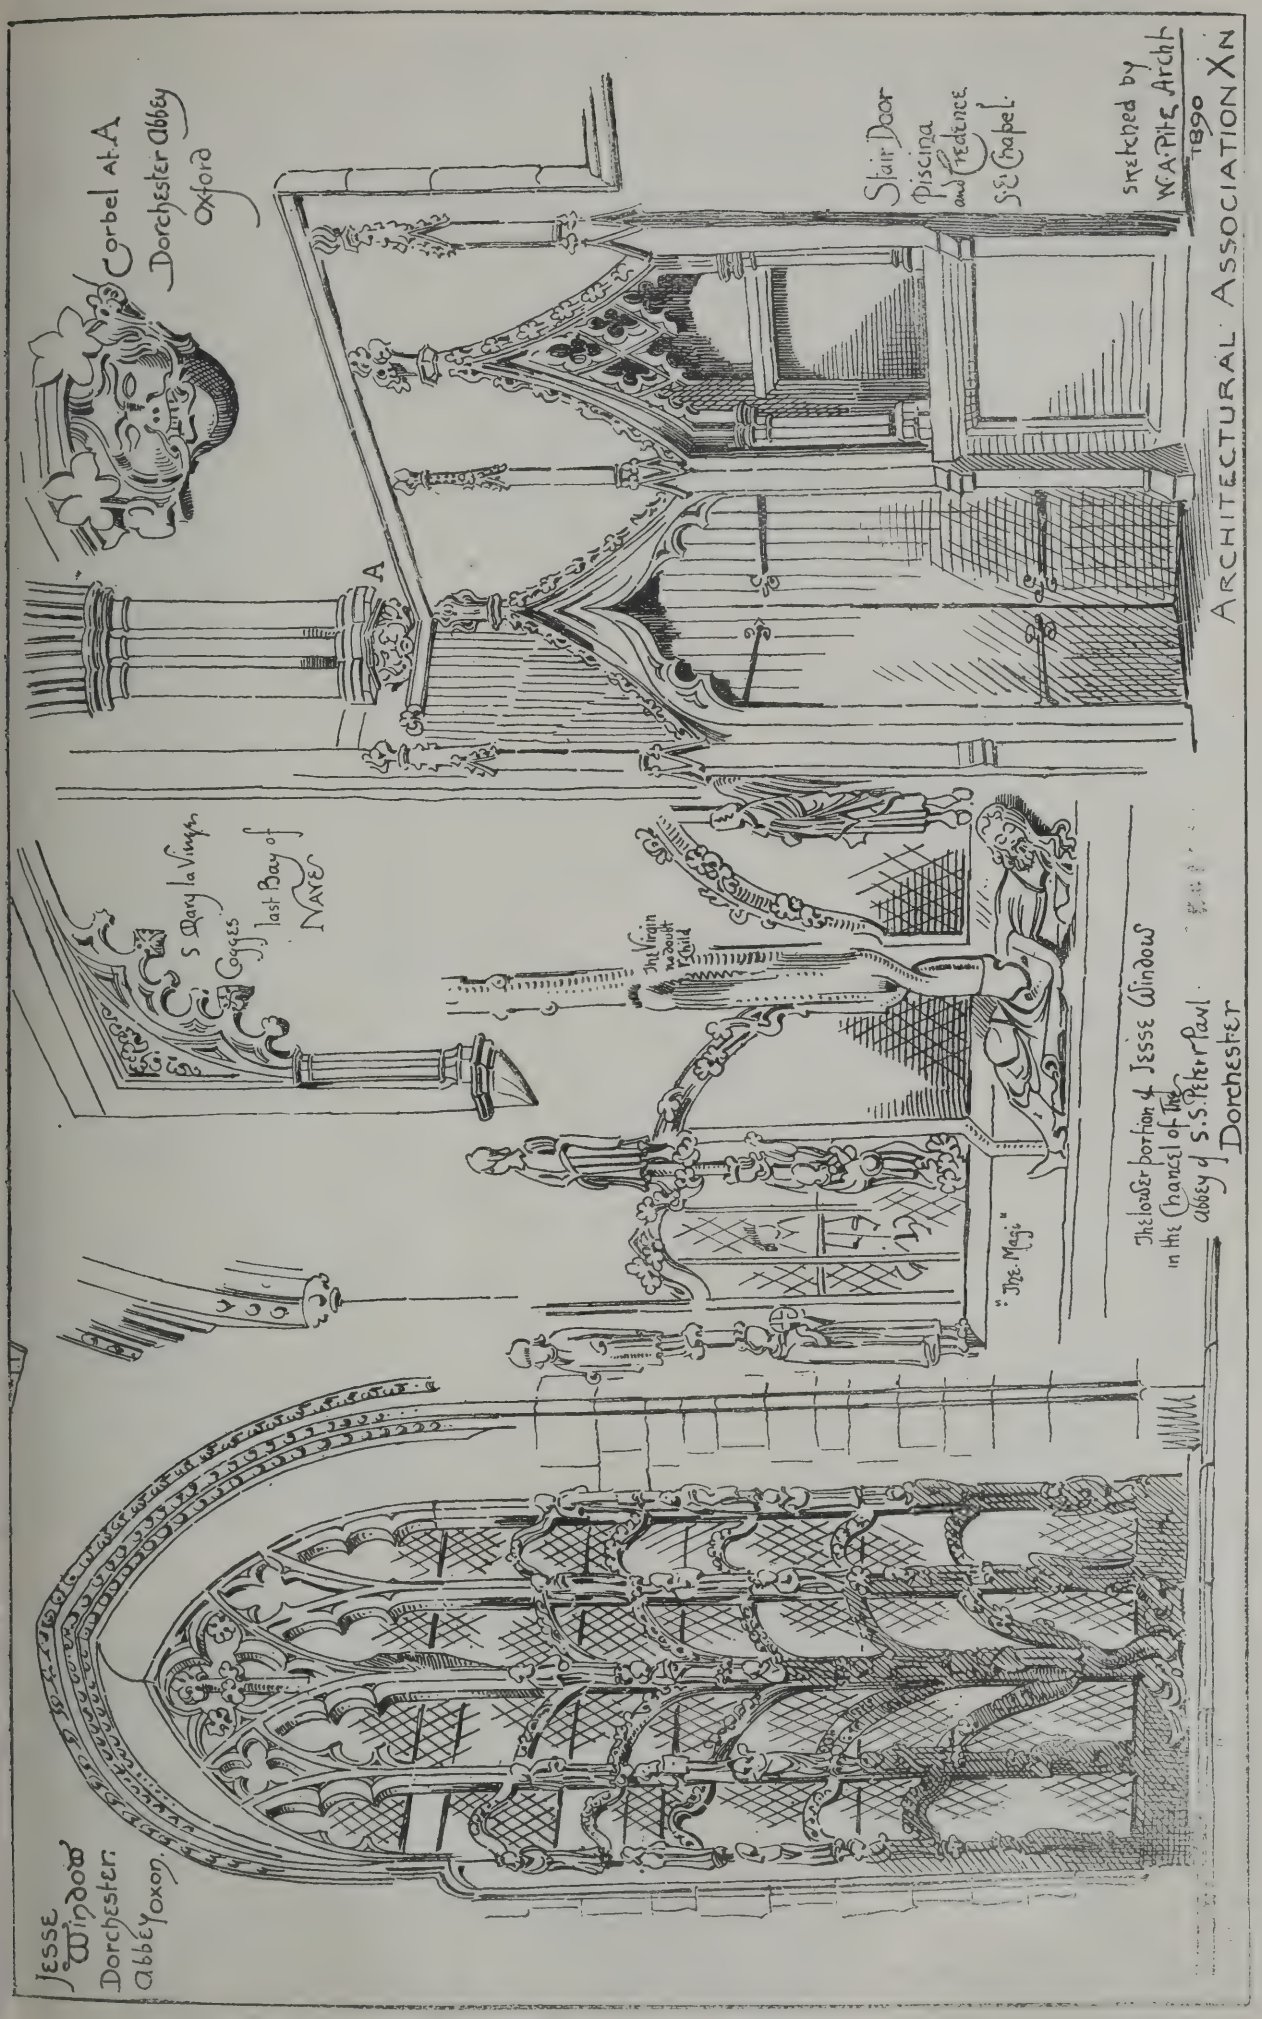
At the Dean of Guild Court at Edinburgh, on Friday, a warrant was granted to Mr. David Watson Stevenson, R.S.A., to convert the Dean Free Church, now disused, into a studio for himself.

Mr. Thomas Guest, of Birmingham, has been selected from amongst several competitors as the architect of the proposed Wesleyan Church, Lichfield.

At the last meeting of the Dundee Water Commission, the proposal of a committee was adopted recommending that the salary of Mr. Watson, the engineer, should be increased from £500 to £600 per annum, and that he should get a gratuity of 250 guineas for his services in the preparations of Parliamentary plans for the proposed new waterworks.

The course of lectures at the Leeds School of Science and Technology, under the auspices of the Leeds branch of the National Association for the Registration of Plumbers, finished a few days ago when the students presented to the teacher (Mr. W. E. Bland) a dressing-case, "in recognition of their esteem for him, and their regret that he is removing to Newcastle-on-Tyne."

A two-manual organ, with eight stops, and in carved oak case, has been placed in the parish church of Madehurst, Sussex. It was built by Mr. Willis.



The Duke of Newcastle, who has given the site on which to erect the proposed St. Cuthbert's College at Worksop, will lay the foundation stone on the 4th September.

The other day, a portion of the stone finial of the south spire over the memorial gateway at Brighton Cemetery fell to the ground. The Cemetery Inspection Committee and the chairman of the burial board, Mr. A. Loader, architect, were speedily on the spot, and after closely examining the spire, and the adjoining one, they directed the further unsafe portions to be removed and lowered, so as to prevent risk. The rapid decay of the stone is assigned as the cause of the damage. The gateway was erected to mark the gift of the cemetery ground to the town by the Marquis of Bristol.

The Uxbridge rural sanitary authority have adopted a scheme by Mr. F. Beesley, of Westminster, for the drainage of Hayes, the estimated outlay being about £10,500.

A movement is on foot at Birkenhead having for its object the preservation of the ruins of St. Mary's Abbey in Priory-street in that town, and a fund being raised having as its first object the re-roofing of the Abbey Chapel of St. James.

A destructive fire occurred on Tuesday on the premises of Messrs. Stimpson and Co., builders, Lancelot-place, Brompton-road, S.W. A brick and timber building of two floors and covering an area of 100ft. by 50ft., used as workshops, engine-house and machinery-rooms, was burnt out, together with its contents. The neighbouring premises, including the Trevor Congregational Church, were much injured by fire, water, and cutting away.

ILLUSTRATIONS.

THE ULSTER BANK, DUBLIN.—CONTEMPORARY BRITISH ARCHITECTS.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES, 1890.—A BURNING GHAT, BENARES.—YO-MEI-MON GATE, NIKKO, JAPAN.

Our Illustrations.

THE ULSTER BANK, DUBLIN.

The Ulster Bank has its head-quarters at Belfast, and the new building illustrated is the principal of its branch offices in Dublin. It occupies a commanding site in the historic College Green facing the Bank of Ireland, which was formerly the Houses of Parliament. Trinity College façade (by Sir William Chambers) flanks one end of the green. At three striking corners of the convergent streets picturesque blocks of buildings have been erected by Mr. T. N. Deane in the last 25 years. Adjoining the new Ulster, the National Bank, a fine monumental building (by the late Sancton Wood), has been elevated, rejuvenated, balustraded, and trophy-crowned with success by Mr. Charles Geoghegan, architect. On the other side of the Ulster Bank Mr. Drew has designed a red-stone and terra-cotta poplin shop on a 20ft. frontage, which gives contrast and scale to the Ulster Bank's pretensions. An insurance office (by Bryce, of Edinburgh, 30 years ago) and the Hibernian Bank assist to make up a singularly diverse and picturesque grouping of buildings. The College Green of Dublin has grown in late years to be one of the most strikingly picturesque of city centres in the kingdom, and from many aspects it now presents pictures such as the late John O'Connor would have painted with effect, or Mr. Logsdaile might now rejoice in. The building stands upon a part of the well-identified site of the Danish Thingmote, where the Scandinavian Kings of Dublin dispensed justice, and later on served as the butts for the archery practice of the Anglo-Norman youths of English Dublin, in the Hoggen Green, as then known. Within a stone's throw stood, until this century, the long Steyne of Dublin, by which, as at Staines and Steyne in Scotland, the Danish piratical settlers were wont to mark their landing stations. The adjoining sites have been rich in many finds of golden ornaments and weapons of bronze, and the statue of William III., lately restored in grand style by the Corporation, is said to stand where a prehistoric cromlech at no distant period was. The new Ulster Bank was the result of a competition of six Dublin architects, of whom Mr. Thomas Drew, F.R.I.B.A., was the successful man. Ballinasloe marble has been used with an unsparing hand in the construction. Its effect seems worthy of the expense, and the carving (by Mr. Emery), if somewhat costly, is most effective in such a sharp-cut and fine material. The frontage is but 42ft., but the height of the building, nearly 100ft., gives it striking importance among the surroundings. The ventilation is by Messrs. Robert Boyle and Son, Limited.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 234.)

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

(A description of these sketches appears on page 209.)

COMPETITIONS.

Bromley.—In a limited competition for proposed United Methodist Free Church, Claremont-street, Bromley, in which five sets of drawings were received, the plans by Mr. V. Dunkerley, architect, of Burnley, were unanimously accepted for the above church. The chapel provides accommodation for about 800 people, and in the rear are minister's and trustee vestries. The front elevation is of a bold design, with a tower at one angle, and is designed in uniformity with the schools adjoining. The cost is estimated at £2,100.

Morley, near Leeds.—At Monday's meeting of the newly-appointed town council for Morley, a discussion took place on the report of the Town Hall committee, which recommended that the Council should advertise for designs for the erection of a Town Hall, and offer premiums of 100 guineas, 50 guineas, and 25 guineas for the three best designs; that for the information of competitors the sum of £15,000 be fixed as the maximum cost, to include all fixtures; and that it be a condition of the competition that each competitor shall, if required, produce a *bonâ fide* tender from an approved contractor to carry out the work for the amount specified in the estimate to accompany each design. The report was eventually adopted.

CHIPS.

It has been decided by the Carl Rosa Memorial Committee to place a marble bust of the late impresario in the Court Theatre, Liverpool, and Mr. William Merritt has already executed the model.

At the last meeting of the court of the Carpenters' Company, master and wardens as under were elected, viz.:—Mr. James Wells Browne, Mason's-hill, Bromley, master; Mr. Thomas Robertson, Park-street, Grosvenor-square; Mr. Benjamin Joseph Jacob, Lewisham High-road; and Mr. William Faith, Croxted-road, West Dulwich, wardens.

Messrs. J. R. Lee and Co. have just placed a stained-glass window in Moseley Parish Church. It consists of three lights, illustrating "The Finding of the Lost Piece of Money," "Christ Blessing the Little Children," and "The Good Samaritan."

Memorial stones were laid last week at Old Swindon of an extension of the Sunday Schools attached to Victoria-street Congregational Church. The new building will accommodate 250 extra children. Mr. W. H. Read is the architect, and Mr. J. Williams (who is the superintendent of the Sunday School) is the builder. The contract price is £500.

The foundation stones of the gasworks were formally laid at Blackwood, near Newport, Mon., on Thursday, the 7th inst. Mr. J. Monks, of Newport, is the contractor.

The Bishop Lightfoot Memorial Fund is to be applied to two objects. The one is the restoration of the Chapter House at Durham—a work on which the late Bishop had set his heart. The other is a statue for Durham Cathedral, for which Sir Edgar Boehm, R.A., has accepted the commission.

A careful survey of Westminster Abbey, taken under the direction of the Royal Commission, has made known the fact that there still remain 90 places within the edifice where interments may take place. By those members of the Commission who are opposed to anything in the form of an addition to the Abbey, this fact is used as an argument for letting things alone. It is pointed out that, taking the average of the last century, it will be a long time before these 90 places are filled up.

The Court of Appeal has permitted Earl Radnor to sell to the nation for £53,000 three of the pictures at Longford Castle, which have up to the present time been heirlooms in the family.

A Local Government Board inquiry was held at Swindon, before Col. Ducat, on Friday into an application from the New Swindon local board for sanction to borrow £4,500 for providing an infectious diseases hospital at Gorse Hill. Mr. H. J. Hamp, surveyor to the New Swindon local board, who prepared the plans, described the scheme, which was warmly opposed by residents in the suburb selected as a site, and also by the local board for Old Swindon.

New headquarters are being provided for the 1st Northumberland Artillery Volunteers in Barrack-road, Newcastle, on the site of the Garden Engine Works, which are being remodelled for the purpose. Mr. W. H. Knowles is the architect, Mr. L. Gaby, of Gosforth, being the contractor.

An organ, built at a cost of £200 by Messrs. Brewer and Co., of Truro, was opened at Grampound parish church on Wednesday week.

Engineering Notes.

School of Practical Engineering.—On Saturday afternoon Sir James Nicholas Douglass F.R.S., engineer-in-chief to the corporation of the Trinity House, distributed the certificates to the Crystal Palace Company's School of Practical Engineering, awarded for the summer term, 1890. The examiners for the term were Mr. A. R. Sennett and Mr. S. H. Cox, who reported that the Electrical section was a valuable addition to the work, in view of the great advances recently made in the practical applications of electrical science. The Colonial section appeared to be filling a want which was more than ever felt—the means of obtaining a practical knowledge of subjects and processes only to be met with in colonial occupations. The class work throughout the term had been very satisfactory, and the drawing specimens exhibited the result of careful training and a thorough appreciation of what was taught on the part of the students.

LEGAL INTELLIGENCE.

Can Workmen Recover for Time Lost in Waiting for Pay?—A deputation of plasterers who said they had been at work on a building for sub-contractors in Victoria-street, Westminster asked advice from Sir John Bridge on Saturday as to whether they could claim compensation for being detained two hours and a half after the ordinary time of leaving off work before they were paid. The spokesman said that the custom of the trade was to cease work at 12 on Saturdays, and the men resented being kept till half-past 2 without their money. They demanded to be paid as if they were kept employed on the building. Sir John Bridge: You cannot do that. Any cause of action would be for work and labour done, and you do no work while waiting to be paid. Applicant: No, because we are not allowed to. Twenty-two of us come plain, and as it is not the first time, on Friday the majority of us signed a paper saying we would not stand it any longer. The consequence is that 10 or 15 of the lot "got stopped." Sir John Bridge told the men that a tradesman could not charge any more for any article if the customer kept him waiting for his money, unless, of course, long credit were reckoned in making the original charge. The workmen were in the same position. He did not see how they could charge for waiting to be paid. Applicant: We considered that the custom of the trade has established the law. The custom is to knock off at mid-day, and that does not mean waiting about for two hours later. Sir John Bridge: You will be quite right if you make a bargain with your master. Then you will have the law on your side clearly, and you will be able to recover. The deputation thanked Sir John Bridge and withdrew.

What is a Street?—Mr. Bros, at the North London Police-court on Wednesday, decided three separate cases which the London County Council had brought against Mr. James Miller. Defendant had erected, without sanction, six houses in a thoroughfare which he called Miller's-avenue, and had successfully resisted an action brought by the County Council to declare the road public. Defendant has since erected some twenty other houses in the same roadway, and he was summoned for making a street for foot-traffic without sanction for its not communicating with two streets; and for its not being open at both ends from the ground upwards—one end being an archway. Mr. Bros dismissed the summons in each case with costs, holding that the thoroughfare was not a street within the meaning of the Act 45 Vic., following the "Metropolitan Board of Works *v.* Nathan," and declining to state a case.

On Saturday Mr. George Dixon, M.P., laid the memorial stone in connection with the Burlington Hall, High-street, Aston New Town, Birmingham, the future head-quarters of the Burlington-street Early-morning School and agencies. The new premises were originally known as the Beaconsfield Buildings, but these are so being altered as to provide a hall seating 300 persons, a set of eight classrooms, public coffee-bar, a members' private reading and refreshment room, a bagatelle-room, committee rooms, library, storerooms, and lavatories. The alterations are being carried out, at a cost of £5,000, by Messrs. McKenzie and Lane, under the supervision of Mr. Thomas Guest, architect.

The Fine Arts Palace at the Champ de Mars has just been leased for an indefinite term of years by the Paris Municipality to the Union Centrale des Arts Decoratifs for the installation of the Decorative Arts Exhibition. The annual rent is fixed at 30,000 francs. This Art Union will let a portion of the building to M. Meissonier's Artists' Society for the holding of their annual Salon.

WAYSIDE NOTES.

IT is commonly supposed that all matters relating to the fine arts are, in France, managed in a vastly superior manner to that which is in vogue in this country, and that State regulations and State officialism across the Channel must ever be held up as models, to be kept constantly in view by those persons who would reform and reorganise our own Science and Art Department. That this is a vain imagining may be learned from the text of the official report on the budget of the Fine Arts, which was distributed to the Deputies just before the closing of last session of the French Parliament. Defects, long widely known, in the French Art Department, are given prominence in this report of M. Antonin Proust; but the most curious portions of the document relate to the conservation of objects of art in the museums. The state of things shows a woful want of accord between the Department of Civil Buildings and that of the Fine Arts. Pictures come under the jurisdiction of the Fine Arts Department; but the hooks, rods, &c., by which they are hung for exhibition belong to the Civil Buildings Department. Statues are under the care of the Fine Arts Department, the pedestals upon which they are placed are supervised by the Civil Buildings people, and conflicts about such matters and about the decoration of the buildings are constantly arising. Such is the condition of affairs in a land where they are not only supposed, as a general rule, to manage things better, but one to which enlightened individuals will point as an example of what might be done to improve the management of art matters in England!

M. Proust suggests in his report that the administration of the Fine Arts Department would be better if divided into services. First, the teaching of art; secondly, the preservation of art; and, thirdly, the encouragement to production. It is certainly very evident, in view of the petty squabbles so constantly arising, that reform is only to be brought about by a thorough reorganisation of the Department. The absurdity of placing a statue and its pedestal, and a picture and its support, under two distinct jurisdictions of equal authority, must be manifest to all. It has been manifest enough to many thinking Frenchmen for a long time. The principle of this divided authority over what are, to all practical intents and purposes, one and the same thing, is so unsound that it is a marvel that it should have endured so long. Perhaps, in the face of M. Proust's report, some reform will be brought about, and the statue and its pedestal, and the picture and its support be placed under the same jurisdiction. There may be many other details in the organisation of the Fine Arts Department that require remodelling; but this discord between the Fine Arts and the Department of Public Buildings stands out from every other shortcoming, and if it continues is calculated to become a source of world-wide ridicule. By the side of the French method the management of our own Science and Art Department is princely. Croak as people may as to the defects in the latter, if they have read the briefest account of M. Proust's report on the budget of the French Fine Arts, they cannot in future point to the former as an example of all that is excellent.

The proprietors of the new Thames subway, and the railway running through it, now take the title of the City and South London Railway Company. Since their first organisation under their original title they have obtained powers for extending the line to Clapham—how much farther they will extend in the future will remain to be seen; but we do know how small concerns, like the original Metropolitan Railway, have crept gradually away from the Metropolis, until the line becomes of quite respectable length. According to statements of Mr. C. G. Mott, who presided at the half-yearly meeting of the C.S.L.Ry.Co., the Company have had many disappointments during the carrying out of their undertaking. What these disappointments relate to was not stated; but by a process of reckoning one concludes that they must have reference to the methods tried for the proposed electrical propulsion. The formation of the tunnels, Mr. Mott said, has led to no mishap; even the work through the water-bearing gravel at Stockwell having been conducted with exceptional success. The stations below are all practically finished, and those above nearly so; the signalling arrangements throughout the tunnels are approaching completion; and the engines for the lift machinery, and those for driving the dynamos are put down. Some delay, it is true, has occurred in connection with the lifts themselves; but they are now making progress towards completion. Thus it would appear that the frequent disappointments, which made Mr. Mott loth to predict the day of opening, must have been occasioned by some little want of caution as to the nature of the electrical arrangements made. Electrical locomotion being yet in its infancy, however, one can scarcely blame the engineers of the City and South London Railway for any delay occasioned by trials of different systems.

Something new in the way of problems in planning is a considerable relief to the architectural world. The County Council Municipal Lodging-House, or Model "Doss-house," as I have seen it styled, will provide a novelty in the way of competitions. It opens the way rather to hard-headed common-sense than fanciful designing. Economy with healthfulness in arrangements will be every competitor's first care. The competition itself promises to be carried through in a satisfactory manner. Inaugurated by the London County Council, and to be judged by two eminent and respected architects, one may safely conclude that it will be free of all those nauseating pettinesses that disgust one in the average competition. And if in the future much work is to be done of a similar description, it will mean something more than £100, or a commission of 5 per cent. on the cost of the proposed building, to the architect placed first by the decision of Mr. Ewan Christian and Mr. Thomas Blashill. More than this, the successful competitor will feel that he has done something towards the solution of one of the many pressing social problems of the day. The housing of single persons who, not always from their own causing, remain of a low degree, in plain healthy buildings, is a good work, second only to that of providing cheap and wholesome habitations for families. Much has been accomplished in the latter direction, and now thought and study are well employed in planning for another section of the body social.

Ninety feet and two stories in the roof is to be the maximum height of buildings in the Metropolis. The Bill containing this restriction—the London County Council Bill—passed through the House of Lords on Monday evening last. At the third reading in the Upper House, Lord Stanley of Alderley moved that the height be restricted to 70ft. instead of 90ft.; but as previous objectors found, the 70ft. maximum originally proposed by the County Council did not prove generally acceptable. How the result of this attempt to prevent "sky-scraping" will be received by the architectural profession, will depend upon individual circumstances. The architect of a proposed lofty block of buildings running close up to 100ft., will consider himself in luck, in that the limit of 70ft. has not been imposed; while the designer of modest little houses will think that the 90ft. is unnecessary and excessive, and that in losing the 70ft. the County Council have failed to do much to effectively stop the tall building mania. For my own part I am inclined to view matters in the latter aspect, although nowadays it is something to be able to stay the growth of sheer walls at 90ft. And it certainly seems a defect in the provisions of the Bill that some attention has not been paid to the very obvious fact that a building of 90ft. may be tolerable in one position, where it would be overbearing in another.

The new Police Office buildings yet continue to puzzle the public, and members of Parliament are still agape at them. On Tuesday evening, on a vote of supply for the Home Department, Mr. Matthews came in for more baiting at the hands of members who consider the incomprehensible nature of the design of the Embankment building to be a personal insult to themselves. Mr. Cavendish-Bentinck led the attack, asserting, among other things, that the building had been viewed with great disfavour by some authorities in the country. Who the "authorities" were Mr. Cavendish-Bentinck did not state, which is to be regretted, since the assertion makes an architect very curious. It is pretty certain that they were not authorities on architectural questions, whatever else may have been their strong point. In reply, Mr. Matthews stated that he had taken the advice of high artistic authorities in London—persons who were at the head of art in this country. He asked them the name of the best architect to employ, and commissioned the gentleman thus named to put up the best building he could for the money. The cost of the building has been £96,000. As I have said before, the building appeals to the cultivated architect, and in itself forms a great addition to London architecture. If there is one thing to be said about it, it is that it does not harmonise generally with the Westminster group; but where was there ever a new building that did harmonise with its surroundings, if it had any true and bold character of its own? And because it does not harmonise with its immediate surroundings it is not to be looked upon as an intruder, if it be in itself excellent. "Dr. Tanner," said the *Times* Parliamentary report on Wednesday morning, "expressed his contempt for the new Scotland-yard buildings, characterising them as a *vulgar interruption* to the Embankment." The reason of this peculiar expression of opinion will, however, be patent to all who followed the course of events in Parliament on Tuesday evening.

GOTH.

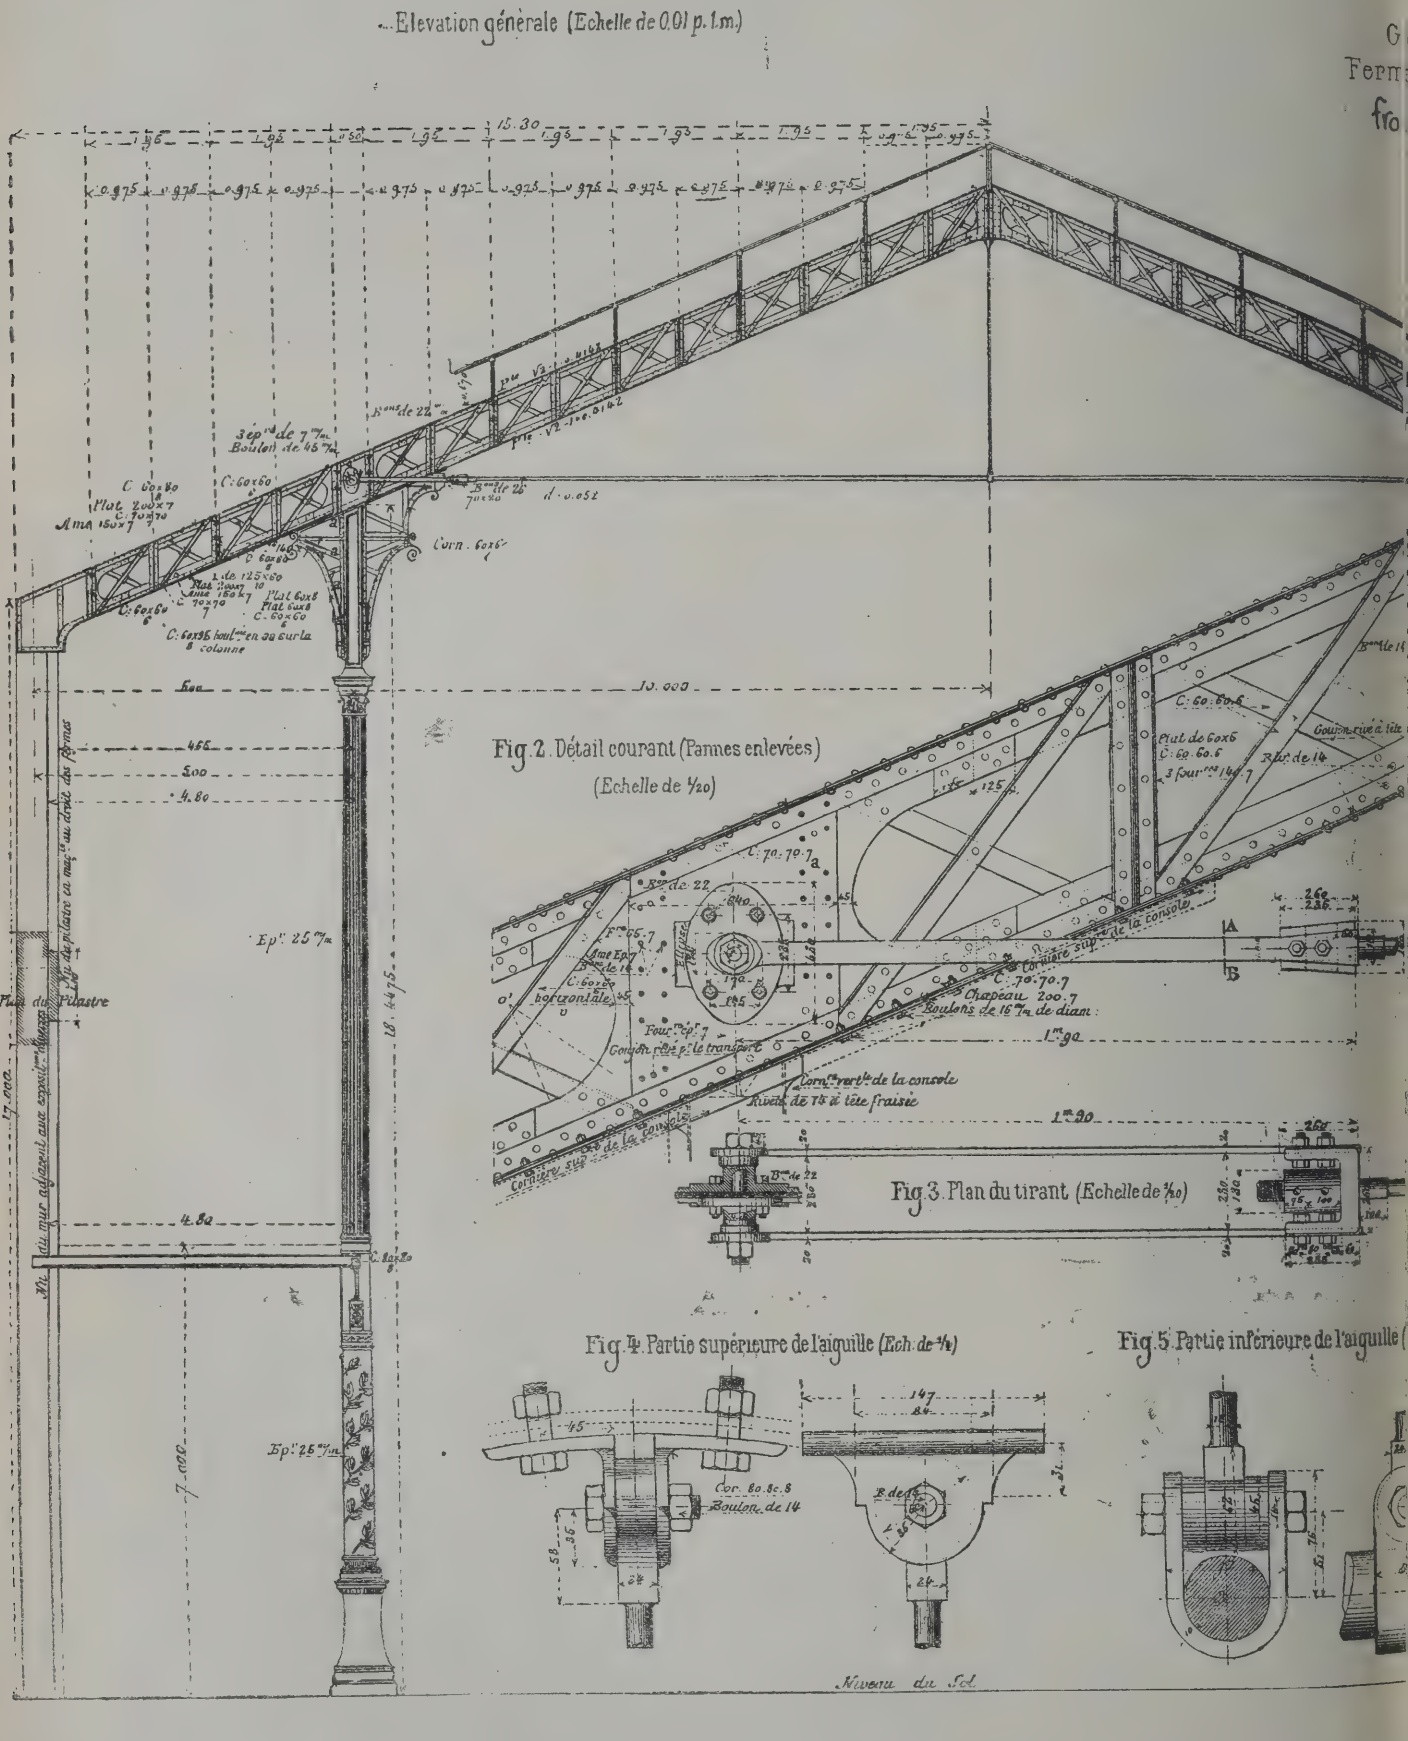
CHIPS.

Alderman James George Naylor, J.P., builder and contractor, of Rochester, died on Friday last at the age of 70 years.

At the last meeting of the Aston Manor Local Board the tender of Mr. Merton Hughes, builder, Birmingham, was accepted for the erection of fire-engine house, drying tower, and new stabling, in accordance with plans, sections, &c., prepared by Mr. W. Augustus Davies, Assoc.M.Inst.C.E., engineer and surveyor to the board. The board have also decided to erect public baths for the district, including first and second class swimming and private baths, and they have instructed Mr. W. Augustus Davies, their engineer and surveyor, to prepare plans, sections, specification, and estimates of the proposed baths for presentation to their next meeting to enable the work to be commenced as soon as possible.

At Paisley Dean of Guild Court, on Friday, plans of a new Free Church, to be erected in Paisley, were passed. The site is at the corner of Glasgow-road and Greenlaw Drive, and the building will have accommodation for 720, besides a hall for 200. The style will be Gothic. The cost will be about £4,500.

The list of receiving orders in bankruptcy announced in Tuesday's *Gazette* contains the name of Thomas White Collard, Herne Bay, clerk and surveyor to the Herne Bay local board.



The annual congress of the Cambrian Archæological Association will be opened at Holywell, Flintshire, on Monday next, and will be continued till Thursday.

At a meeting of the Yeovil town council, held on Monday, Mr. Armytage, assistant surveyor for the borough of Preston, was elected borough surveyor and manager of the waterworks. The salary is £270 a year, and the retiring surveyor will act as consulting surveyor for three years.

On Monday, August 4th, memorial stones were laid of the new entrance to the Wesleyan Chapel, Burbage, Leicestershire. Mr. Thomas Guest, of Birmingham, is the architect.

A special meeting of the Worthing Local Board was held last week to consider what steps should be taken in reference to the disappearance of the assistant clerk. A letter from the missing clerk was read, admitting serious defalcations, and asserting that these were increased and ultimately came to light in consequence of the refusal of the late surveyor to the local board, Mr. W. Horne, to meet or renew the writer's bills. Another letter was read from a Mrs. Penrose, mother of one of Horne's pupils, asking whether the youth ought to be continued in the Board's service, although Horne had filed his petition in bankruptcy and been dismissed. Some members declared that the Board had been to blame in allowing Horne to receive premiums of £30 to £50, and it was decided to refer the matter to a committee, with instructions to keep the youths on, if they worked satisfactorily. Mr. R. S. Hyde was appointed surveyor *pro tem.*

Four windows have just been placed in the parish church of Newton Toney, in Wiltshire, by Messrs. Heaton, Butler, and Bayne. The subjects are Faith, Hope, Charity, and Fortitude. Faith is represented by the healing of the Centurion's servant, Hope by the appearance of the angel to the two Marys at the sepulchre on the morning of the Resurrection, Charity by the Good Samaritan, and Fortitude by St. Paul before King Agrippa.

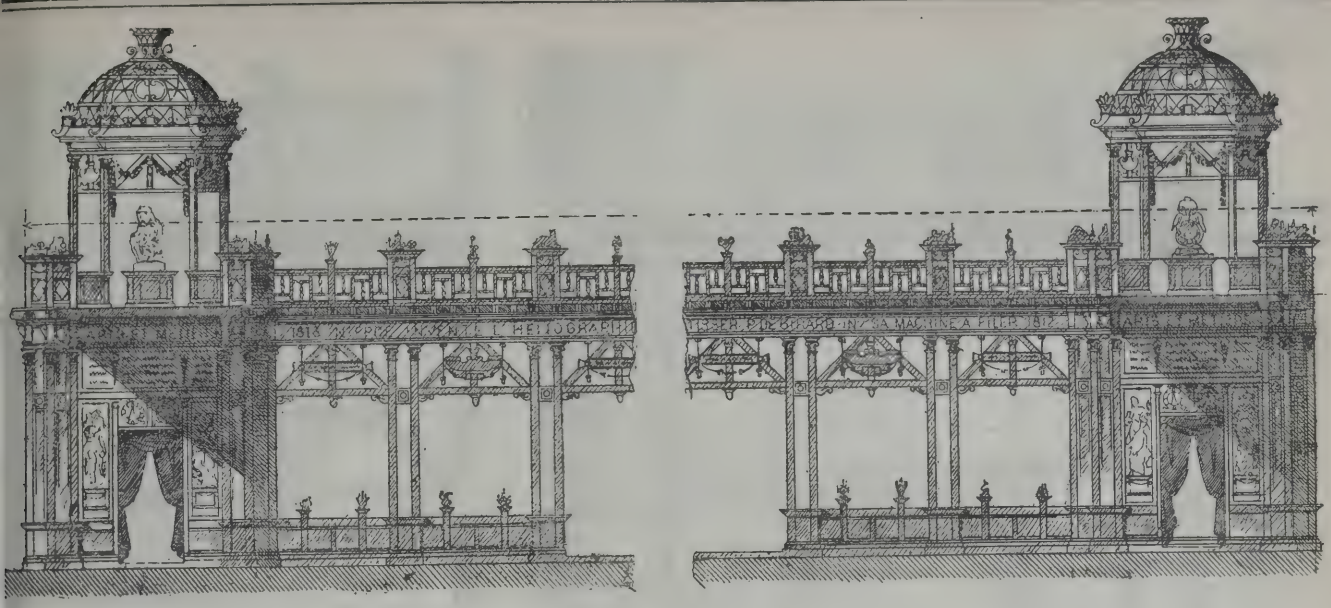
CONTEMPORARY BRITISH ARCHITECTS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THIS is the nineteenth double-page group of architects' portraits given in our pages this year. The first photograph on the sheet is that of—



Mr. Malcolm Stark, Jun., I.A., who was trained in the office of Mr. Wm. N. Tait, I.A., Glasgow. He is about 36 years of age, and has been about 14 years in practice. His principal works of a domestic character are: Cuilvona, Loch Ard, Perthshire, for Mr. Patrick G. Morison; Park House, Dumbartonshire; Ferriemill, Stirlingshire; Middlecroft, Dumbartonshire; additions to the Knowe, Port Glasgow, for Mr. Joseph Russell, shipbuilder, and about thirty villa residences distributed in the suburbs of Glasgow; Kelvinside, Pollokshields, &c. His ecclesiastical works include Gilfillan Memorial Church, Dundee; Blochairn Free Church, Glasgow; Alexandria Wesleyan Methodist Church; Rockville United Presbyterian Church, Glasgow; Dennistown Evangelical Union Church, Glasgow, and additions to several Presbyterian churches in Glasgow and the West of Scotland. He has erected mission halls in Arbroath, Leith, Cockenzie, Haddingtonshire, Whiflett, Kirkintilloch, Coatbridge, and Blantyre. Besides factory buildings in Rutherglen, and a Board School in Kirkintilloch, Mr. Stark has erected a considerable amount of property of a miscellaneous character distributed in Glasgow, Coatbridge, Kirkintilloch, Kilsyth, Aberfoyle, Dumbarton, Barrhead, Leeds, &c. Mr. Stark was one of the premiated competitors in conjunction with Mr. James Lindsay, of Glasgow, for the new War and Admiralty Offices. He also obtained the 2nd premium in the competition for the proposed Edinburgh Municipal Buildings on the adjudication of Mr. Waterhouse, and the 1st premium in the competition for the Gilfillan Memorial, Dundee, on the adjudication of Mr. G. W. Browne, of Edinburgh. Recently Mr. Stark's design for the new lunatic asylum for Hawkhead, Gasgow, was placed first in a competition confined to Glasgow architects by the referee, Mr. Sydney Mitchell, of Edinburgh, and Mr. Stark has since been appointed by the Govan District Board of Lunacy to carry out the work. Mr. Stark is a member of council of the Glasgow Institute of Architects. About two months ago Mr. Stark assumed as a partner Mr. Frederic Rowntree, of Scarborough, and since then the firm have been engaged on several commissions in England, including the erection of some important buildings for Mr. J. E. Ellis, M.P. for Nottingham. Mr. Stark's photograph was taken by Messrs. Brinkley and Stevenson, of Sauchiehall-street, Glasgow.

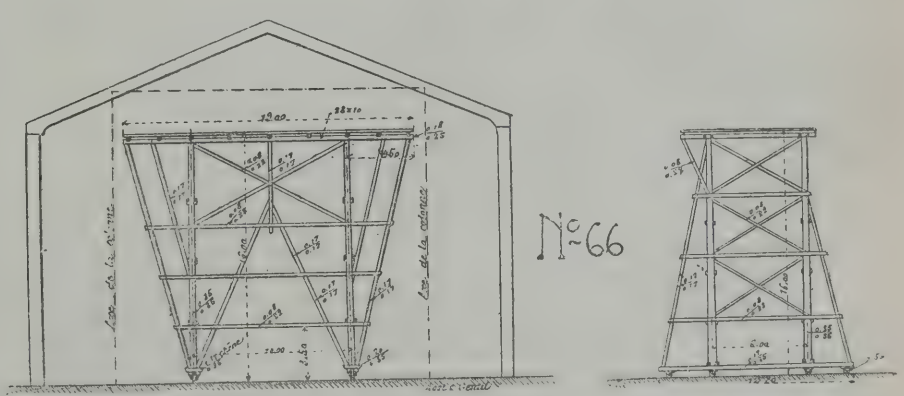
The late Mr. John Carrick, who died on the 2nd May, was City Architect of Glasgow and Master of Works. He was also a Fellow of the Royal Institute of British Architects, a Member of the Institute of Civil Engineers, and a Member of the Glasgow Institute of Architects. He was a pupil of the late Mr. John Bryce, of Glasgow, and on completing his apprenticeship he was for some time an assistant with the late Mr. Herbertson, of Glasgow. He then went to Messrs. Hurst and Moffat, of Doncaster, and on returning to Glasgow from Doncaster he became an assistant with his old employer, Mr. Bryce, and subsequently entered into partnership with Mr. Brown, under the firm of "Brown and Carrick." Mr. Brown having succeeded to an estate near Edinburgh, the partnership only lasted for a few years, during which time, however, such works as Renfield United Presbyterian Church, Renfield-street; Free Church, Eglinton-street; Evangelical Union Church, Montrose-street; Corn Exchange, Hope-street; and various business premises throughout the City were carried out by them. Shortly after the termination of partnership Mr. Carrick entered the service of the Corporation, having succeeded the late Mr. Hume in the office then known as Superintendent of Streets and Pavements, and about the same time he was appointed by the Police Commissioners architect to the Prison Board of Lanarkshire. Having been City Architect and Master of Works for the long period of forty-six years, the works carried out by him were both numerous and varied. Among the more important buildings executed from his designs were the following, viz.:—Western, Eastern, additions to Central, Northern (now in course of building), Saint Rollox and Marine Police-offices; Springburn, Yates-street, Camperdown-street, Dalmarnock-road, and South Wellington-street Police-stations; fire-stations in Soho-street, St. George's-road, Warwick-street, Cranston-street, Saint Rollox, and College-street, with its predecessor in Bell-street; Dead-Meat Market, Moore-street; entrance to Cattle Market, Graham-square; Old-Clothes Market, Greendyke-street; Dog and Bird Market, Jail-square; Bazaar and new entrance to City Hall, Candleriggs-street; additions to Museum, Kelvingrove Park; Greenhead, Townhead, Northwoodside, Cranston-hill, and Southside public baths and washhouses; Drygate, Greendyke-street, Portugal-street, Clyde-street, North Woodside-road, and Hyde Park-street model lodging-houses; fever and small-pox hospitals, Belvidere, and sanitary washing-house; artisans' dwellings (erected, and in course of erection), Saltmarket-street; cleansing department premises, Parliamentary-road, and gunpowder magazine. The portrait is from a photograph by Messrs. Ralston and Sons, 311, Byars-road, Hillhead, Glasgow.

Mr. Andrew Heiton, F.R.I.B.A., served his apprenticeship with his father, who was the city architect of Perth, and who had an extensive practice in the county and district. Among his executed works are:—Houses in Perthshire: Loyal House, for the Hon. W. Ogilvie; Dunalastair, for General Sir John Macdonald, K.C.B.; Craighall; Newmilne; Belvidere; Taybank; Hopepark; Gorthy; Bonskied; Newfargie, Glenfarg; Aldernaig; Cordney; Port an Eilean; Dundarrach; Hamilton House; Drumearn; Orchill, Kippen, Dunning; Castle Keillour; Dunearn; Glenbruach, Craigclowan; Lethendy Tower; Dalguise; Druidsmere; Drumfork; Garth, for Sir Donald Currie, K.C.M.G., M.P.; Kilbryde Castle, Dunblane, for Sir James Campbell, Bart. Houses in Forfarshire: Fernhall, for Mr. John Sharp; Forthill; Beechwood; the Gunge; Ravenscraig; Castleroy, for Mr. Geo. Gilroy, all in Broughty Ferry; Airlie Mount; Balloch; Craigisla, at Alyth: Hallyburton House, Coupar Angus, for Mr. Graham Menzies. Houses in Fifeshire: Seggie; Gaurdbridge; Westwood, Newport, for Mr. Harry Walker; Kinbrae, Newport, for Mr. John Leng, M.P.; Cameron Bridge, for Mr. H. V. Haig. Boleside and Brunswick Hill in Roxburghshire; Vogrie House, Gorebridge, for Colonel Dewar; Glencarron House, Denny; Giffen Castle, Ayrshire, for Mr. H. G. Patrick; Westwood Grange, Headingly, Leeds, for Mr. A. T. Lawson; shooting lodges of Glenmore and Lyn Magilbert, near Aviemore, and additions to Enville Hall, Stourbridge, for the Earl of Stamford and Warrington. Station buildings for the Scottish Central Railway Company, Scottish North-Eastern Railway Company, and the East of Fife Railway Company; and in 1863 the village of Cowlairs (workmen's dwellings) for the Edinburgh and Glasgow Railway Company; Union Bank of Scotland and Savings Bank, Perth; Victoria Buildings, Tay-street, Perth. Re-construction and new infirmary wings to James Murray's Royal Asylum, Perth; Poor's House, Perth; Scones Lethandy farm buildings, Perth; Kinnoull School and Caledonian-road School, the latter in course of erection; Dreadnought Hotel, Callander; Perth Station Hotel; Municipal Buildings, Perth; Athole Hydropathic Establishment, Pitlochry; Presbyterian Church, Rutland-square, Dublin; Rathgar Church, Dublin; Presbyterian Church, Kingston; Free Church, Broughty Ferry; St. Andrew's Church, Perth; Newtyle Parish Church, Forfarshire; Kinfauns Parish Church, R. C. chapel, Crieff; St. Mary's Monastery and Church, Kinnoull, Perth; restoration of St. John's Church, Perth. Mr. Heiton has been for many years architect to the City of Perth. The photograph reproduced is by Mr. Marshall Wane, Edinburgh.

Mr. George Soudon Bridgman, M.S.A., of Torquay and Paignton, was born in Torquay in 1839, was educated at Chudleigh, and articled to Mr. J. T. Harvey, architect to the Manor of Tormohun, and on the expiration thereof he left for London, and was engaged by the late Mr. Thomas Burton, of the City. He returned to Torquay, and commenced practice in the year 1865. Among his early works was the erection of a private residence for the Rev. T. G. Hall, of King's College, and the Torquay Hotel, Torquay. In the year 1866 he laid out the land between the old village of Paignton and the sea shore, and superintended the erection of the sea walls, land drainage, and prepared Parliamentary plans for the Paignton waterworks. His practice has been principally confined to Torquay, Paignton, and Dawlish; but his buildings have been erected about Devonshire, and comprise private dwellings, some streets of houses, and business premises. Oldway Mansion, for the late Mr. J. M. Singer, was erected from his plans at a cost of over £25,000, with stabling and conservatories to same at a cost of £12,000; also farm buildings for the Right Honourable Lord Clifford and other landowners in Devon and Somerset. He has designed about a dozen chapels, halls, &c., a similar number of church and chapel restorations, eight new Sunday school buildings, also eight college and educational buildings, board schools, &c. The most recent of his public buildings are new wing to the Imperial Hotel, Torquay; the Town Hall, Public Buildings and Art Schools, St. Mary Church; Market Hall, Public Hall, and large Board Schools, Brixham; Devon and Cornwall Banking premises, new Public Hall, drill shed, and new hospital, Paignton; Masonic Hall, Brixham; Masonic Hall, Dawlish; also new Devon and Cornwall Banking premises, Dawlish, with other works now in hand. He has been assisted for a time by his son-in-law, Mr. S. G. Goss, A.R.I.B.A., who has recently joined his brother, Mr. H. H. Bridgman, F.R.I.B.A., of 42, Poultry, E.C., as partner. Mr. G. S. Bridgman has been a member of the Torquay Local Board of Health, and for more than eight years a member of the Paignton Board, is now president of the Paignton Liberal Association, and Vice-President of the Society of Architects. His photograph is by Mr. J. Rawlings, of Paignton.

Mr. Thomas Jackson, whose portrait comes next, has been, and is, practising in Belfast for close on sixty years. He was articled to the late Mr. George Dymond, of Bristol, and at the conclusion of his pupilage he removed to his native country, Ireland, where during his long practice, he has carried out quite a number of buildings, a list of some of which we may enumerate. All are in Belfast, unless otherwise stated. Savings Bank, Waterford; Corn Exchange; Museum; music hall; Scottish Amicable Assurance Company's offices; St. Malachy's Chapel; "Friends" meeting house; "Friends" meeting house, Lisburn; Unitarian meeting house, Ballymena; Reformed Presbyterian Church, College-square North; Presbyterian Church, Rosemary-street; nineteen new branch banks, for the Ulster Banking Company, besides additions and alterations to about as many more; Fountain-street hall; Braidwater Spinning Mills, Ballymena; Barn Flax Spinning Mills, Carrickfergus; Gunning and Campbell's Mills, Falls-road; Chermside and Co. (now Messrs. J. and T. M. Greeves) mill, Falls-road; Flax Spinning Mill, for the late Mr. Bosey; Flax Spinning Mill, Cupar-street, for Messrs. J. and T. M. Greeves; Flax Spinning Mill, Glenbank, for Mr. Emerson; Flax Spinning Mill, York-street, for Mr. Andrew Mulholland; weaving factory, for Messrs. Kennedy; large bacon curing establishment, for Mr. J. Strangman Richardson, at Waterford; large bacon curing establishment, for Messrs. Sinclair; residences for Mr. Demseath, Ballymena, and for Mr. Patrick and Mr. Young at same place; Mr. Green, Tullylagan, co. Tyrone; Mr. Lloyd, Tamnamore, co. Tyrone; Mr. Joy, at Craigovad, co. Down; Mr. Gray, at Graymount, co. Antrim; Sir David Taylor, Bertha, Belfast; Mr. John Arnott Taylor, Drum House, Belfast; Mr. Penrose, Houghton, Cork; Mr. Wm. Peet, Rockville, Waterford; Mr. John Owden, Seapark; Mr. Thomas Greer, Seapark; Mr. Boomer, Seaview; Major Rowan, Merville; Mr. Robert Grimshaw, Longwood; Sir Thos. McClure, Bart., Glenmachan Tower; Mr. Jonathan Cordukes, Glenebor; late Sir Wm. Ewart, Bart., Glenmachan; Sir Wm. Quartus Ewart, Bart., Schomberg; Mr. Wilson, Lurgan; Mr. John Cuppage, Lurgan; Mr. Henry Cuppage, Lurgan; Mr. Fras. Watson, Lakeview, Lurgan; Mr. Hugh Watson, Stramore, Portadown; Mr. Forster Green, Derryvolgie; Mr. John Greeves, Lismachan; Mr. Thomas M. Greeves, Tweskard; Mr. Joshua Richardson, Old Forge; Mr. Joshua Pim, Lisnagurvey, Lisburn; Mr. James Richardson, Lissue, Lisburn; Mr. Joseph Richardson, Springfield, Lisburn; Mr. John Dunville, Richmond, Belfast. Warehouses for Messrs. Barnett, Messrs. Arnott and Co., Forster, Green and Co., Grattan and Co., and shops for Messrs. Gunning and Co., Messrs. Anderson and McAuley, and

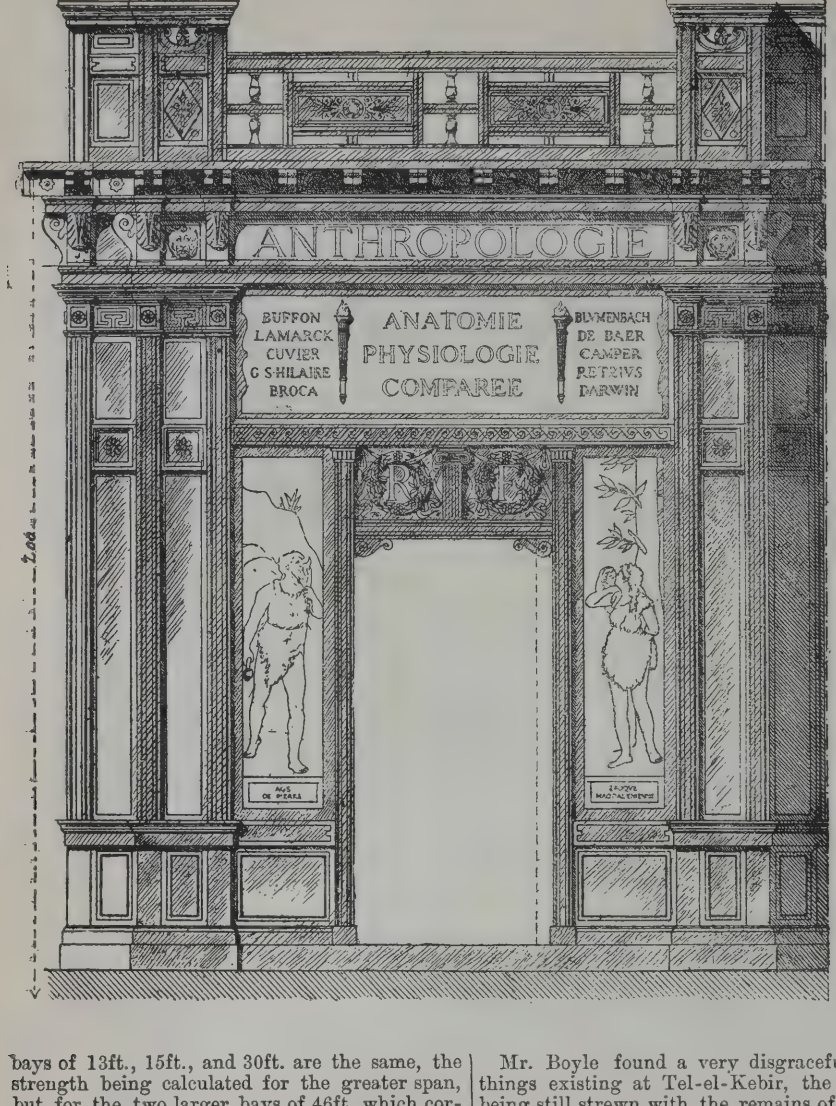
s. Bottomley and Co.; the Royal Elms, ıont, Royal Terrace, Ashley-place. The graph is by Messrs. Mavius and Vivash, of st.



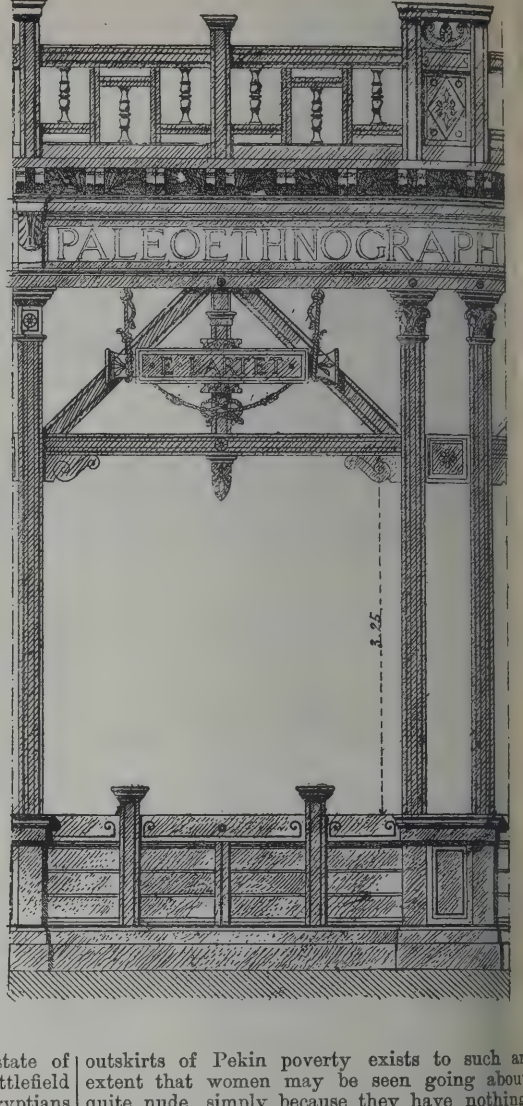
e last portrait on the plate is that of Mr. axon Snell, who has given us this list of o buildings executed or about to be executed his designs:—New Hospitals: St. Olave's n, St. George's Union, Holborn Union, St. lebone, Kensington (as consulting archi- nly), Mitcham Schools Infirmary, Holborn n. St. Marylebone Workhouse: Temporary l wards, male and female infirm wards, pro- nary wards, master's house and adminis- e offices, permanent casual wards, cellular m, able-bodied workhouse, engine-house, en, chapel, and other administrative offices. uke's Workhouse: Male and female infirm s, master's house and administrative offices, en, laundry, and engine-house. Hendon n Workhouse: New able-bodied wards, &c. orn Workhouse: Additional offices. Clerken- Workhouse: Dispensary and various addi- l offices. Rotherhithe Workhouse: Casual s, cellular system. St. George's Union, over-square: Able-bodied workhouse, Ful- road; additions to male and female infirm s, master's house, engine-house, and large ions to Administrative Offices; chapel; re- ng house for able-bodied sick lunatics, &c., Vallis's-yard, Pimlico. Kensington Work- e (as consulting architect only): Able- d wards, clerks' offices, and additions to nistrative offices. New Dispensaries: St. lebone at East-street, St. Marylebone at e Union-place. Old Premises converted Dispensaries: St. George's Union at Buck- am Palace-road, Holborn Union at Farring- Workhouse, Holborn Union at Old-street. Relief Offices: St. Marylebone at East- t, St. Marylebone at Little Union-place. Premises converted into Relief Offices: St. rge's Union at Horseferry-road, St. George's n at Buckingham Palace-road, Holborn n at Old-street, Holborn Union at Far- don Workhouse, St. Marylebone at Brown- t, St. Marylebone at Regent's Park. ools: Nursery, engine-house, and large ctions to the Administrative Offices of St. lylebone Schools at Southall, St. Marylebone ools at Holborn Union Schools at Mitcham. ritable and other Public Institutions: Con- scent Institution for Children at Norbiton, al Patriotic Fund boys school, mortuary for parish of Clerkenwell, schools at Forest Hill the School Board for London, first-class nming-bath for the Commissioners of St. lylebone baths and wash-houses. Hospitals: al Victoria Hospital, Montreal; Royal In- ary, Hull; Royal Infirmary, Aberdeen; jected extensive alterations to Huddersfield rmary; Hull Royal Infirmary, out-patients' artment; Victoria Hospital for Children, out- ents' department; Nurses' Home, St. Maryle- e Infirmary; Leanchoil Hospital, Forres. Paro- l: St. Marylebone, new laundry and able- ied wards; additions to St. George's Union rkhouse, Fulham-road; Holborn Union rkhouse at Mitcham, for 1,000; receiving house and casual wards for the St. George's Union, Hendon Union Workhouse, Middlesex; mortuary for the parish of St. Marylebone; new offices for the guardians of the Holborn Union; dining hall for the St. George's Union Workhouse, Fulham-road; new offices for the guardians of the Fulham Union. He is the author of "Charitable and Parochial Establishments," and "Hospital Construction and Management." The photograph reproduced is by Messrs. W. Notman and Son, Montreal.

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—IX.

By Banister Fletcher, Jun., A.R.I.B.A.



THE RETROSPECTIVE EXHIBITION.



THE wooden framework inclosing this exhibition, the contents of which are described in a different heading, was designed by M. Paul Sedille (No. 63, from *Le Génie Civil*), a French architect well known in England, and to whom I am especially indebted for many kindnesses in enabling me to get at information not accessible to the general public. M. Sedille had all the interior decorations and "installations" under his control, and to him are due to a great extent the harmonious effects of colouring in the interior. He was also the architect for the Porte de la Mosaique at the entrance to the Galerie de Trente Mètres. The two plates here given (Nos. 63 and 64, from *Le Génie Civil*) represent about half the length of the Retrospective Exhibition. The colouring to the woodwork is in shades of green and red, and the construction is beautified by several rather rough, but effective and suitable, frescoes by M. Toché, illustrative of the Histoire du Travail. The construction, as has been mentioned, occupies the whole of the centre of le Palais des Arts Libéraux.

THE GALERIES RAPP ET DESAIX.

The Galerie Rapp and the Galerie Desaix are precisely similar in design and construction, and are placed in the transverse axis of the Champs de Mars, and serve to connect the wings of the Palais des Exposition Diverses with the Palais des Beaux-Arts and the Palais des Arts Libéraux respectively. The Galerie Rapp forms one of the most important entrances to the Exhibition from the Avenue Rapp leading from the Pont de l'Alma. The Galerie (see No. 65, from *Le Génie Civil*) has a span of 30 mètres, or 98ft. 6in., and is comprised of trusses resting on one side on the solid wall of the wings of the Exposition Diverses buildings, and on the Palais des Beaux-Arts side on large iron standards 3ft. 6in. square, which also help to support the glasswork in the Beaux-Arts gable. At a distance of 10 mètres (32·8ft.) from the centre of the building on each side are a row of cast-iron columns, which not only carry the principal weight of the roof, but also support the gallery, which runs from end to end of the building at a height of 22ft. 9in. from the ground, and which projects from the wall the same distance as the columns, about 15ft. (It is round this gallery that are arranged the French architectural drawings, and also those of some other countries, which will be noticed under a different heading.) Above these cast-iron columns is the truss itself, and exactly over the central axis of the column is secured the tie-rod which binds the trusses together; this rod is held up in the centre by a light suspension rod secured to the truss under the ridge. The cast-iron columns are 60ft. 6in. high, and are cast in three pieces. The spacing of these columns varies considerably, owing to the fact that the great constructional lines of the Palais des Beaux-Arts had to be taken into account; here the trusses are 9·20m., or 30·17ft., apart. Another alteration in the spacing was necessary to make the lateral galleries of the Palais agree with the columns of the Galerie Rapp. They are therefore 14 mètres or nearly 46ft. apart at this position. The other spacings of 13·12ft. and 51·21ft. have resulted from the plan, from which also it will be seen that there are seven bays of 30·17ft., two bays of 46ft., two bays of 15·21ft., and four bays 13·12ft. Counting the double purlins which come over the columns, the roof has altogether 17 purlins. The design and strength of the purlins for the

bays of 13ft., 15ft., and 30ft. are the same, the strength being calculated for the greater span, but for the two larger bays of 46ft, which correspond with the lateral galleries of the Beaux-Arts building, they are strengthened by top and bottom plates (see plate). The lighting is from the top by a lantern, which is supported on the nine uppermost purlins by means of uprights in U-irons, between the backs of which is riveted a longitudinal T-iron at the top, on which by the aid of angle-irons are riveted the cruciform sash-bars on which rest the glass. The iron-work throughout is painted "grey-blue," and the columns, although one would think they would look "lanky," are of graceful outline; the part below the gallery is decorated with a spiral flower pattern. The columns themselves are fluted above this gallery, which itself is supported on iron joists running into the wall, on which rest the wooden joists and floor boarding. These are varnished underneath, and are left open to view. The plate given, No. 65, is very complete and detailed in respect to these trusses and columns The total length of the Galerie Rapp, which is exactly the same as the Galerie Desaix, is about 386ft. 6in. The scaffolding (No. 66 from *Le Génie Civil*) for the erection of these two galleries is simple and light, and is on wheels running with the axis of the building, and within the cast-iron columns, the central line of which is shown by a dotted line. Each of the trusses, which weigh about 3½ tons, was completely framed and riveted on the ground and raised in one piece. The cast-iron columns, which weigh about 6½ tons, were raised in four parts.

A SANITARY CRUSADE ROUND THE WORLD.

(*Continued from page* 202.)

WHEN in Cairo Mr. Boyle met Mr. Stanley on his arrival from Central Africa; his father, the late Mr. Robert Boyle, as a friend of Dr. Livingstone from his boyhood, having been an earnest co-worker in the great cause of which Mr. Stanley is now so able a representative.

Mr. Boyle found a very disgraceful state of things existing at Tel-el-Kebir, the battlefield being still strewn with the remains of Egyptians killed in the fight, skulls and bones lying about everywhere, in some places in heaps. That this should be, is highly discreditable not only to the Egyptian authorities, but also to the English officials in Egypt, who take good care that the cemetery where the British slain are buried at Tel-el-Kebir is well looked after.

In India it is a revolting sight to see the poor victims of that most loathsome of all diseases, leprosy, who, as beggars, are permitted to frequent public places, instead of being isolated in hospitals, though there are several for lepers in India maintained by voluntary contributions. Child marriages are a curse to India, and shaving the hair off widows and condemning them to life-long singleness, usually spent in the most abject poverty and misery, is a most barbarous and unnatural custom. The practices of the Hindoo religion, the principal religion of the country, which are often of a very filthy description, tend greatly to retard the advance of sanitary progress, in striking contrast to the Mohammedan and Jain, which inculcate cleanliness by both precept and practice.

It will be readily understood that in a country having a population of over two hundred and fifty-four millions, personal cleanliness must be an important factor in the public health.

We give an illustration of a Burning-Ghat at Benares, described in last week's BUILDING NEWS

Canton is a nest of pirates, murderers, and thieves, where every street is barricaded for protection with strong gates, which are closed at sunset, and where the more respectable portion of the inhabitants store for safety everything they have of value in great strong stone towers, guarded by armed men, and which also serve the purpose of pawnshops.

In Pekin, the streets are publicly used by the inhabitants as a common receptacle, with the grossest disregard of all decency, and the most shameless scenes are to be witnessed. No lady could with propriety pass through the streets of Pekin except in a closed sedan chair. In the outskirts of Pekin poverty exists to such a extent that women may be seen going about quite nude, simply because they have nothing wherewith to clothe themselves. It has long been a popular belief that the population of Pekin was the largest of any city in the world it having indeed been fixed as high as five millions Mr. Boyle has ascertained from most reliable authorities, including the Russian and Dutch Chargés d'Affaires at Pekin, the latter having been resident in the capital for over eighteen years, that it certainly does not exceed half-a million.

Mr. Boyle was struck with the enormous populations of the towns on the Yang Tze Kiang and Yellow Rivers, some of them containing over million inhabitants. The Yang Tze Kiang is the longest navigable river in the world; it is also the longest river, being 3,158 miles in length, or 95 miles longer than the Amazon popularly credited as the longest known river The Yellow River bears the significant synonym of "China's sorrow," owing to its terrible inundations, which bring famine to millions; but Mr. Boyle has been informed, by members of the Yellow River Expedition, that it is proposed to recommend the erection of dykes at different points, for the purpose of keeping the water on the land. If this can be accomplished, it will be an inestimable boon to China.

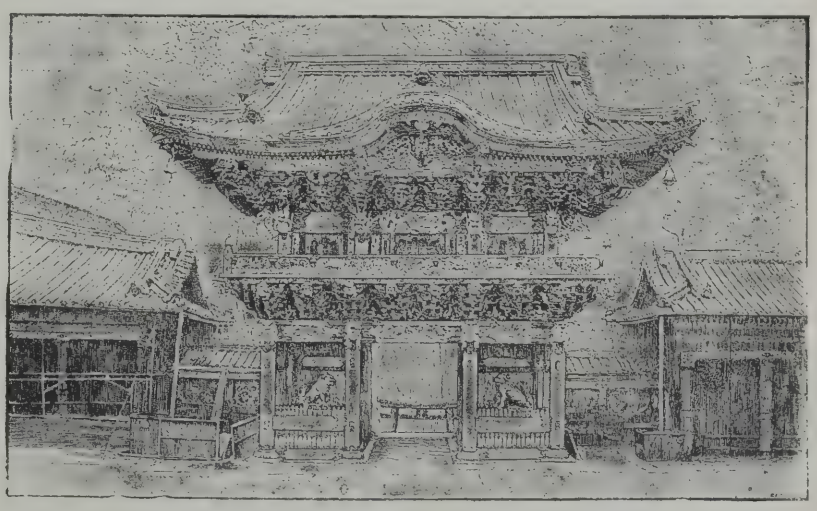
It is Mr. Boyle's opinion, from what he saw that China has now undoubtedly commenced to move; and with a population of over three hundred and forty millions of people of superior physique and mental ability, acknowledged business capacity, and of untiring energy and patience, it is destined in the future to be one of the great ruling powers of the earth, if even higher position is not in store for it. Confucianism and Buddhism are the professed religions of the country, though the Chinese have really no genuine religious belief.

The Japanese are very cleanly people, and it is the custom to take a hot bath, often several times a day, at a temperature between 100° and 115° Fahr., though in the public baths, in which as many as 400 may have washed, the water

A BURNING-GHAT, BENARES.

changed once a day. Until quite recently sexes used to bathe together indiscriminately, in large towns a railing in the middle of the now divides the males from the females, but not screen them from being seen by each r; but the people are so simple and unsophis-ed that you can never get them to under-d that they are naked. Even in large towns and women may be seen going about their es quite naked, with not even the regulation eaf to adorn them. Female shampooers, are generally blind, are a great institution Japan. Prostitution is rampant in Japan, e being more public women there, in propor-to the population, than in any other country the world, though they occupy a higher l position than elsewhere, and respectable select wives from their ranks. Owing to strict observance of cleanliness, disease is st entirely absent.

he religions of the Japanese enforce cleanli-, Buddhism and Shintoism being the prin-l; the former has more adherents. Buddhism thrice as many votaries as any other creed in world, numbering over 400,000,000; but the r is the original religion of the country, in h nothing is to be found indicative of a f in a future or the existence of a soul. The les at Nikko are superb, and the famous Mêi-Mon Gate, as will be seen from accom-ring sketch, is a perfect gem of carvers' art. more than probable that the Japanese will, re long, adopt some form of the Christian gion, and from all appearances it will be the an Catholic, as that body is considerably d of the Protestants in Japan.



nce the accession of the present Emperor, or ado, the Hara Kiri, or self-disembowelment, rted to under certain circumstances by the er classes, has been abolished, and many r reforms introduced, which have helped tly to advance the country in its present ard progress.

he authorities at Tokio have decided to carry a scheme for the supply of pure water to the tal at a cost of over a million and a quarter ing.

r. Boyle saw granite stones in the walls of old feudal castles at Osaka and Nogoya, an, measuring 20ft. by 14ft. by 10ft., larger any stones used in the Pyramids, or any of ancient buildings of Egypt.

great writer says: "We live in a century h has been prolific of enterprise and inven-, and the vast industrial activities proceeding efrom have revolutionised the material and l conditions of the world. Each of these great forward movements have been pre-eminently the work of one person, specially gifted for the task which he was destined to undertake." It seems to have been Mr. Boyle's destiny to raise the all-important question of ventilation from the obscure and neglected position it occupied to its present proud place in the ranks of the sciences; he has, indeed, laboured unceasingly for the last twenty years in the cause of sanitary science, and the numerous valuable inventions he has produced, a description of which may be found in the biography of "Robert Boyle," by Lawrence Saunders, now in its 20th edition, particularly the air-pump ventilator, upon which he has recently effected important improvements, are known and used all over the globe, and he has well earned the distinction of gold-medallist and other honours conferred upon him by different scientific societies in this and other countries. The Boyles, as founders of the profession of ventilating engineering, have raised the subject to the dignity of a science; and the name of Boyle, in connection with ventilation, has become a household word throughout the world.

It is, as we have already mentioned, Mr. Boyle's intention to publish his experiences in the East, in book form, and from what we have been permitted to see of the work, we believe that it will be a valuable addition to the already lengthy list of descriptive and scientific contributions to literature of which he is the author, and when published, which will be shortly, we can safely predict a large demand for it. Mr. Boyle's next crusade will be to the Congo States, South Africa, and Zanzibar, where he will, doubtless, be as successful as he has been elsewhere in his efforts for the promotion of sanitary science.

YO-MEI-MON GATE, NIKKO, JAPAN.

Mr. E. W. Loft, a distinguished architect of Sioux City, Iowa, died there of consumption a fortnight ago. Mr. Loft, although quite a young man, had carried out many important commissions in and about Sioux City, and was the designer of the curious "Corn Palaces" which have been erected annually in that city for several years.

At the meeting of the Southampton Town Council on Wednesday, Mr. J. H. Thorn presented the town with a framed portrait in oils of Charles Dibdin, the sailors' poet, who was born at Southampton in 1745. It was presented on behalf of the poet's grand-daughter, Mrs. Cecilia Ashe. The portrait was painted from life in 1800, by Kearsley, was exhibited at the Royal Academy, and is to be hung in the Council Chamber.

Building Intelligence.

Great Grimsby School Board.—The Jame Meadows Schools have recently been complete and handed over to the board, and provid accommodation for 200 girls, 300 boys, and 40 infants; total, 1,000. The buildings are al covered with Broseley tiles, and built of red brick with Ancaster stone dressings. The floors ar of wood blocks, and the heating and ventilatio by a combined system of hot water, with radiator &c., by Messrs. Ashwell, of Leicester. The cos is under £6 per head. Messrs. Walker an Cook, of Grimsby, have been the contractors Mr. W. W. Gravell, clerk of works; and Mr E. W. Farebrother, F.R.I.B.A., of Grimsby, th architect.

London School Board.—At the last meetin of this Board, Mr. Helby called attention to th enormous rise in the tenders for school building the amount being about £16 10s. a head fo building alone, or £22 including site. Makin every allowance for the rise in the cost of materi and of labour, and for an increase owing to th Board insisting upon its contracts being carrie out strictly, he thought that the Board migh still save something by having independent archi tects. He moved, therefore, that Mr. Ewa Christian should be requested to prepare plan and specifications for a school for 1,200 childre on the Lillie-road site (Chelsea). In thus movin he meant no slight upon the Board's architec The amendment was carried on a division, but o a further division on the amendment as a sub stantive motion the numbers were equal, and th matter therefore dropped.

Perth.—The new nave of St. Ninian's Epis copal Cathedral, which, after standing for thirt years in an unfinished state, was recently com pleted, was consecrated on Friday by the Righ Rev. Dr. Wordsworth, Bishop of St. Andrew's The initiative in the erection of the cathedr was taken in 1847 by the late Lord Forbes, an the work was begun in 1849. Owing to the wan of funds the cathedral was left in an incomplet state, in which it remained until about thre years ago. A proposal to have it extended i accordance with the original plans of Mr. W Butterfield, of London, was adopted at a Diocesa Council. Sufficient funds had been subscribe by the beginning of 1888 to justify the acceptanc of contracts, and the work has therefore bee finished at a total cost of about £7,000. As stood before completion the cathedral consisted a choir, two transepts, one bay of the nave, an of the two aisles, and the additions made inclu three bays to nave, north and south transept and a western tower; and sitting accommodatio has been provided for about 900 persons.

The town council are about to alter and impro the Harvey Institute at a cost of about £3,800, accordance with plans prepared by Messrs. Tayl and Cox.

Messrs. C. Isler and Co., of London, have co pleted artesian bored tube wells on their improv principle at the Kirkstall Brewery Co. Lim., Lee where for some time past the supply has all b failed from the existing dug well, and, after reac ing the depth of 160ft. from the surface, sprin were struck yielding 6,000 gallons of water p hour, without reducing the head of water. Simil results are obtained at Mr. J. W. Wrigh Brewery, Armley, Leeds. At Messrs. J. C. and Field, Limited, London, a continuous supply over 7,000 gallons per hour is obtained from artesian bored tube well, 404ft. deep. At Mess A. M. Perkins and Son, Limited, Regent-squa Gray's Inn-road, an artesian bored tube w 300ft. deep, yields continuously at the rate of 3,0 gallons per hour. At the Pure Water Compa Limited, Battersea, the yield from a 400ft. artes bored tube well is over 3,000 gallons per ho Similar results are met with at Messrs. Bow Brothers, Park-street, Bermondsey, from artesian bored tube well, 350ft. deep. Amon their various contracts, Messrs. Isler are at pres engaged at Hatfield, having received orders fr the Marquis of Salisbury, to fix an artesian bo tube well to supply the town with water; Mes Shoolbred and Co., Tottenham House, Tottenh Court-road; Messrs. Peters Brothers, Roches fixing a 15½in. diameter artesian bored tube w 300ft. deep, into the lower green-sand formati Messrs. Bramwell and Co., Wear Brewery, Sund land; also at Messrs. G. Clark's, Limited, sh building yard, Sunderland, and at the Kelste Brewery, Flint.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is. per line of Eight words, the first line counting as 5, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 36 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FIVE WORDS, and Sixpence for every eight words after. *Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—G. and P.—S. and Co.—W. and J. R. F.—F. J. and Co.—G. C.—W. B.

THE OWNERSHIP OF PLANS.

To the Editor of the BUILDING NEWS.

SIR,—I beg indulgence to say a few words in reply to an article, "The Ownership of Plans," which appeared in your issue of June 24th.

My brothers in architecture on that side of the Atlantic will find, as I have found on this side, that Courts in general have little sympathy with the "high-toned" rules and regulations of the various professions.

With regard to the ownership of plans, &c., it has been held that when a person has paid for any certain thing it becomes his property when final payment has been made, so that, if architectural drawings and other matters pertaining thereto are to remain the property of the architect after he has received his commission, it must be clearly and mutually understood and agreed by and between himself and client; in other words, a contract must be drawn up and entered into by these parties to the effect that the drawings and other documents be considered as instruments of service only, and as such are the property of the architect, and shall be returned to him when their special mission has been discharged. Provision also should be made in case of the abandonment of the proposed work. Furthermore, if copies are supplied to the owner, it should be agreed then and there that they are supplied as a guide to the building for which they were made only, and that no other use be made of them without the knowledge and consent of the architect.

Not only should this be the rule between architect and client, but a clause should be inserted in the contract between the client and the builder, that "It is mutually understood and agreed, and is hereby agreed by the parties hereto, that all drawings, plans, and specifications are instruments of service only, are the property of the architect, and must be returned to him at his office when the work for which they are intended is completed." This will give ample security against all loss or damage occasioned by the retention or loss of any drawings or copies by the builder.

There is far too much of what is called professional etiquette, which is no more than a sham and a humbug, and the sooner it is laid aside and the more solid and practical details of business practised, the sooner will the profession and its individual members generally be benefited.

No honest man will refuse to sign a just and honest contract, nor will he think the less of the man who requires him to do so. The man who has his brains for sale is exactly on the same footing as the man who has bricks for sale, and all obligations of whatsoever kind should be made as binding as the law allows. No Court will decide against a contract honestly entered into and duly signed by the contracting parties. This, at least, has been my experience in this country, since I discovered the fallacy of supposing our rules and precepts would be considered law. It is the general rule in the Western cities of this country to insert the above clause in all the builders' contracts, and it has been my rule to have contracts with all my clients, and only in one instance have I been compelled to take the matter into Court, when I came out victorious.—I am, &c.,

JOHN GEO. THURTLE.

57, Ingalls Block, Indianapolis, Indiana,
U.S.A., July 26, 1890.

CHIPS.

From an answer given in the House of Commons on Monday night by the Chancellor of the Exchequer, it appears that the trustees of the National Gallery are negotiating with the Earl of Darnley for the purchase of three pictures from his collection.

The will of Mr. Thomas Andrew Walker, the railway and dock contractor, has been proved at upwards of £982,000.

The Lord Bishop of Llandaff on Thursday in last week unveiled a memorial window in the chancel of the parish church of Christchurch (Mon.), in memory of the late vicar, the Rev. F. H. Archer. The window was designed by Mr. C. E. Kempe, Northampton-place, London, and erected at a cost of £250.

Large additions are being made at Swaylands House, Penhurst, the residence of Mr. George Drummond. Mr. M. E. Macartney is the architect. The whole of the fireproof floors are being put in on Fawcett's system.

In our notice of the laying of the foundation-stone of the Royal South London Ophthalmic Hospital by the Prince of Wales on the 25th ult. we omitted to mention the builder's name. Mr. William Downs has the contract, which is about £20,000.

Kilmallie parish church, near Fort William, N.B., was reopened last week after partial rebuilding, including new roof and seats, the addition of a vestry and porch, and the filling-in of a memorial window with stained glass representing the Resurrection of our Lord, a work carried out by Messrs. Ballantine, of Edinburgh. Mr. Macintosh, of Oban, was the architect, and Mr. Macnab the general contractor.

The old Halle aux Blés in Paris has been transformed into the Bourse de Commerce, and was reopened on Sunday. The well-known dome now surmounts a circular hall about 150ft in diameter, round which the new buildings, which are about 50ft. wide, form a ring. They are divided into offices, the greater number of which are now set apart for business purposes. One section of the buildings has been arranged as a commercial museum by the Société Coloniale Commerciale et Industrielle.

A fine art and industrial exhibition was opened at Lanark by the Earl of Home on Saturday. The exhibits are in six sections, and occupy the whole of the grammar school. The loan collection of old masters is an exceptionally good one, and the Braidwood collection of Bibles, lent by Dr. Hunter, contains many rare specimens.

Fearnought Cabinet Works, Bedford-street North, Halifax, occupied by Mr. Hiram Rothwell, were burnt down on Saturday. The building was the property of Messrs. George Greenwood and Sons, builders' merchants, and contained two rooms, each 60ft. by 30ft. The damage is estimated at £2,200.

At a meeting of the Association of Public Sanitary Inspectors, held on Wednesday night at Carpenters' Hall, Mr. Alexander, the chairman of the Council, announced that Dr. B. W. Richardson had acceded to the request of the Council that he would accept the presidency of the Association in succession to Sir Edwin Chadwick. He was unanimously elected to the office, and will give an inaugural address on the life and work of his distinguished predecessor.

Intercommunication.

QUESTIONS.

[10336.]—**Double Flights.**—Are there any published examples of double stairs? I shall be glad of any notes of old and modern examples. How are they generally constructed?—ESCALIER.

[10337.]—**Stoup.**—Of what does this generally consist? and please inform me if there are any Mediæval instances in good preservation?—ALF.

[10338]—**Beam.**—A beam over a 32ft. span is loaded with 1½cwt. per foot run, with the exception of 8ft. at one end. Determine the reaction upon the supports.—L. L. D.

[10339.]—**Centrolinead.**—I should be obliged if some reader used to the centrolinead would kindly give directions as to the method of using and setting this instrument?—PERSPECTIVE.

[10340.]—**Board Schools.**—I should be pleased if any of your numerous readers would kindly inform me whether there are any good modern books on the design and arrangements of higher-grade board schools; if so, what are the names of writers and publishers? Am anxious to get the best works on the subject.—ENQUIRER.

[10341.]—**Camber.**—Can any reader give me the literal meaning and derivation of the word "camber"?—J. H. V.

REPLIES.

[10322.]—**Reredos.**—The most ancient examples of this screen are found at York, Durham, and Winchester. Exeter has an old example. The reredos is generally composed of tabernacles or niches, or of plain painted decorations of patterns. Hangings of tapestry and silk are often placed over the wall as a background. Several examples have been illustrated in the BUILDING NEWS: one in Westminster Abbey, 1867; one in Gloucester Cathedral, 1873; and one in St. Martin's, Brighton, 1881.—G. H. G.

[10326.]—**Storage Reservoirs.**—J. Bailey Denton's work on "Storage of Water," 1874, reviewed in "B. N.," and the articles on the subject in "B. N." of 1869, may be referred to by the student. Taking a daily consumption of water at 16 gallons per head per day, impounding reservoirs should contain 120 days' supply in rainy districts, and 200 in dry districts. Service reservoirs should contain three days' supply. Cement concrete can be used for a reservoir, and these should be asphalted with Claridge's patent asphalte.—G. H. G.

[10327.]—**Cost of Repairs.**—For some houses an allowance of ten per cent. on the rental is made for repairs: but it is obvious that there can be no absolute rule, so much would depend on the manner in which the house was originally built.—H. L.

[10327.]—**Cost of Repairs.**—The cost of repairs for buildings of usual character and condition may be taken at 1 to 2 per cent. on the cost of building. The allowance made for repairs of houses is generally taken at one seventh of the rental. See Hurst: Tarbuck's work on valuation of Property.—G. H. G.

Additions have been made to University College, Nottingham, the ventilation of which is carried out on the Boyle system, the extraction of the vitiated air being effected by the latest improved form of the self-acting air-pump ventilator.

At a meeting of the newly-formed board of guardians of Great Grimsby and 23 outlying parishes, held on August 1st last, Mr. E. W. Farebrother, F.R.I.B.A., of Grimsby, was appointed the architect for the new workhouse buildings by a majority of 37 votes to 3. The buildings, which will be erected on a commanding site adjoining the town, will be on the pavilion system, and be replete with every modern convenience.

On Sunday special services were held at St. John's Church, Canton, Cardiff, in connection with the dedication of the reredos recently erected in the church. The reredos is of Caen stone, with red and green Irish marble columns supporting the cusping and canopies. The three niches are to be filled with paintings in oil on canvas, the centre portraying the Good Shepherd, with St. Peter and St. John on either side. New altar steps of red Dumfries stone have been introduced. The work has been carried out by Mr. William Clarke, of Llandaff, from the designs of Messrs. Kempson and Fowler, architects, Llandaff.

At the half-yearly meeting of the City and South London Railway Company the chairman stated that the entire subway from King William-street to the Swan at Stockwell was now finished, and the permanent way had been laid throughout the tunnels. The electric main cable for conducting the electricity was also laid through both tunnels, as was the service conductor which would conduct the electricity to the locomotives. The construction of the lifts had taken much longer than had been anticipated, and this had caused delay in the completion of the work. The stations would eventually be lighted by electricity, but for the present gas would be used. It would be necessary for the railway to be worked for a short time before it was opened to the public; but he believed the opening would take place at the end of next month. The extension to Clapham Common, for which the company had obtained Parliamentary sanction, would not be proceeded with until the first portion of the line was in working order.

Our Office Table.

Mr. Cavendish-Bentinck has been misled in asserting that the remains of Grinling Gibbon's throne are *still* to be found in a lumber-room at Canterbury Cathedral. Archdeacon Smith, writing from the Precincts in that city, says he has never been able to find them, and if Mr. Cavendish-Bentinck has, as he asserts, actually seen those relics, it is possible he may be able to assist in discovering and restoring the fragments of the throne to the minster. The Ven. Archdeacon corrects another little blunder of Mr. Cavendish-Bentinck in ascribing to Grinling Gibbons the stalls at the west end of the choir of the Cathedral. They appear to be identical with the work for which the Chapter contracted in 1682 for £320 with Mr. Roger Davis, who had erected for them the wainscoting of the choir in 1676. Mr. Bentinck admits in his reply that the fragments of the pulpit are not to be found now, but explains that some years since he was shown them in a store in the east cloister of the Cathedral by Mr. H. G. Austin, then surveyor to the fabric. As to the choir stalls traditionally ascribed to Gibbons, he maintains that the main point is not by whose hand they were carved, but whether they were not too beautiful in design and execution to justify the present Dean's endeavour a few years since to sweep them out of the Cathedral and replace them by the late Sir Gilbert Scott's work.

Good progress is being made with the works of excavating the Priory foundations in the parish churchyard of Kenilworth. The contractors, Messrs. E. Smith and Son, have now cleared the outlines of the entrance and porch, the north transept, the south transept, part of the chapel and annex, a portion of south cloisters and north cloister walk, and the nave and columns of the tower. The cloister garth, chamberlain's offices, and several other parts will not be disclosed under the present contract. The church and offices must have been very extensive, as the portions disinterred show. It was found necessary to excavate 4ft., or very considerably deeper than was at first anticipated, to get to the floor levels. Two tombs discovered are interesting features. One is very richly ornamented, and possibly belonged to the founder. Evidences of several monuments and statues, with sculpture, were found. Every fragment of masonry yet found has been of excellent design and detail. A number of carved stones, tiles, and other relics, including 13 corbels, have been deposited in that part of the ruins which has been for years in a state of preservation known as "the Tantarra." Here they are safely locked up, but visitors can see them through the open iron-barred gate, and, on application, can make a closer inspection. New walls, about 4ft. 6in. high, are now being built round the churchyard, and are to be surmounted with palisades, giving a finish to the work, and support the earth around. The work has been carried out without any disturbance to existing graves, and the accomplishment of the scheme will be completed by the time agreed upon. During the past week the work of relaying the turf has been commenced on some portions of the ground.

The thirty-third annual report of the National Portrait Gallery announces the death of one of the trustees, Lord Lamington, in February last, and the appointment to the vacancy thus created of Mr. W. H. Alexander, the donor of the new gallery which is about to be erected at the rear of the National Gallery from Mr. Ewan Christian's designs. Fifteen gifts and half-a-dozen purchases are recorded. The list of 452 donations given in previous reports has been brought up to 467 during the past year, and includes portraits of Lord Iddesleigh, painted by Edwin Long; Sir Elijah Impey, in crayons, by Sir Thomas Lawrence, P.R.A., at the age of 16; T. De Quincey, plaster bust, by J. Steell, R.A.; J. Flaxman, R.A., General Sir Willoughby Cotton, G.C.B., Captain Arthur Conolly (the Central Asian explorer), and Professor H. H. Wilson, all four by James Atkinson; Oliver Goldsmith, Belzoni, Sir E. Landseer (painted by Sir F. Grant, P.R.A.), Earl Minto, Marquis of Hastings, Sir Rowland Hill, and Mr. Robert Browning. The purchases, amounting in all to 433, have received the following accessions during the year:—J. Grimaldi, Dr. J. Wolcot ("Peter Pindar"), by J. Opie, R.A.; John Dryden, by Sir G. Kneller; Admiral Sir Sidney Smith (the picture representing an incident at the siege of Acre), a painting by Raeburn of Professor J. Playfair (the natural philosopher and mathematician), and an engraving of General Monk, Duke of Albemarle.

Trade News.

WAGES MOVEMENTS.

Bolton.—The negotiations for a settlement of the strike of cabinetmakers at Bolton have fallen through. The employers offered to concede ½d. per hour advance to the day-wage men, and 5 per cent. all round to the piece-hands; but this was rejected by the men's committee, who adhere to the previous resolution, which is 10 per cent. advance all round for piecework, and ½d. per hour for day-wage men.

Barnsley.—There have been further negotiations between the Barnsley carpenters and joiners and their employers. The latter now offer to give 7¾d. per hour, as against an offer last week of 7½d., now, and an advance of ½d. in thirteen weeks. The men refuse to accept less than 8d. per hour, which they had asked.

Edinburgh.—The conference of stoneworkers, which began in Darling's Hotel, Edinburgh, on Tuesday week, was resumed there on Friday, Mr. John Adam, Aberdeen, presiding. The rules by which the Amalgamated Union of Stone and Quarryworkers is to be conducted were read by Mr. A. Carter, Enderby, Leicestershire, who has acted as secretary of the Conference. On the motion of Mr. W. Forrest, Bonawe, Argyleshire, seconded by Mr. J. Ward, Huncote, Leicestershire, the rules were adopted unanimously. The business of the Conference—so far as the amalgamation of the Scottish Settmakers' Union and the National Union of Quarrymen of England was concerned—having thus been completed, the English delegates withdrew, leaving the Scottish delegates, under the presidency of Mr. J. Miller, Ratho, to frame regulations suitable for their respective districts.

Medway Cement Works.—The men employed at the Beaver Cement Works, Frindsbury, and at Mr. Ball's works at Strood, are out on strike, the total number of men out reaching close upon 200.

CHIPS.

The fine organ of Hereford Cathedral is to be entirely reconstructed at a cost of about £2,000.

An interesting excursion in connection with the Archæological Section of the Birmingham and Midland Institute took place on Saturday last, when Lilbourne, Stanford, and Swinford were visited.

The Pontypridd board of guardians are about to build cottage homes for pauper children, on the main road from Llantrissant to Pontypridd, from plans by Messrs. Seward and Thomas, of Cardiff. The work will be carried out by Messrs. Turner and Sons, of Cardiff, at a cost of £7,482.

The annual meeting of the Monmouthshire Antiquarian Society took place at Newland on Monday.

The dredging of the channel of the River Medway has been completed by the Naval authorities. The works have cost about twenty-five thousand pounds, and heavy battle ships will now be able to pass between Chatham and Sheerness at ordinary tides with their equipment on board.

Holloway's Pills.—The balsamic nature of Holloway's Pills commends them to the favour of debilitated and nervous constitutions, which they soon resuscitate. They dislodge all obstructions, both in the bowels and elsewhere, and are, on that account, much sought after for promoting regularity of action in young fema'es and delicate persons.

OOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

D ENGINEERING JOURNAL.
VOL. LIX.—No. 1859.
FRIDAY, AUGUST 22, 1890.

RACTICAL ARCHITECTS.

RE is a good deal in the word practical" that appeals to most having anything to do with build- he memory of very many recalls s of edifices never completed, owing t cost; buildings whose founda- re shaky, towers half-finished, and uses which can never be healthy, to imperfect sanitary construction. asionally hear of such omissions as es, windows, and even doors, and we member public buildings, erected cost, which have dark, perplexing s, badly-lighted halls, staircases erely try the respiratory organs, and ventilated and draughty courts. s and lecture-halls of defective properties add to the long list of s which are pronounced failures. Of it is not of much use to argue architect is irresponsible for these

It is even less an excuse to call to hat these edifices, or some of them, en designed by eminent architects— high artistic powers. To the public hese mistakes of construction are nable, and no artistic skill exhibited rchitecture will for a moment atone errors. The most able art-architect, not practical, is regarded with sus- nd distrust by the bulk of those who architects; his talents and genius n order that are too transcendent or for ordinary mortals who deal in and mortar. Imaginative design, efforts in stone and marble, the ements of perspective, light and shade r, are all beyond the employer, and architect attempts to exercise his in any of these ways, he is very icked. The theoretical architect ot an individual in whom the client sed to place confidence. He is too trying new "fads" or experiments r he has the chance, often at the the client. Though he has an un- d confidence in his own ideas and s, he generally gives little satisfac- l some of his "theories" do not work practice.

ractical architect comes to his task extensive experience with building ns. The trades have been learned by quaintance with the workshop; the ment and valuation of artificer's lave given him an insight into cal methods of conversion of ma- nd the labour on them; he looks at *king-out* of designs, rather than of rtistic treatment and principles. of an abstract embodiment of ideas, ng presents, in his mind, rather a -out of various trades—a matter of brickwork and masonry, carpenter's er's work, materials and labour. It l at more from the point of view of ractor and quantity surveyor. The he constructor may be apparent, yet y of scientific construction has not empting as to lead to the display of But it is rather by the grasp of facts es that the practical architect obtains , and these we desire now to say g about. The architect whose ge of the business has been gathered ntirely from reading, study, and g, is unprepared to enter into a work- surveyor's view of building. For e, at least, he is diffident to pass an n anything so technical or practical as to the difference of cost between brick and stone, or on any matter of heating or drainage. His answers are general, and evasive of practical issues. On these points the practical architect has decidedly the advantage.

And what is the kind of preparation needed to fit a man for the practical part of the profession, and is it such that it can be acquired without compelling a young man to pass half his earlier days in the office of the surveyor or builder? We may answer that the equipment of a practical man resolves itself into a knowledge of methods, labour, and cost. What to do under certain circumstances, and the best way of performing the work cannot be learned by seeing work actually executed. The reason of such-and-such an operation is not disclosed to the inexperienced apprentice in the mysteries of the craft. Nor can he learn them from treatises. Take, for example, foundations on yielding soils. The most desirable mode of forming a foundation on a shifting soil, such as sand, by preventing the "flow" of the soil, or spreading laterally, is a principle. The architect ought to know how to accomplish it in the best way. Experience tells him that if he extends the base of his footings by grillage or piles, or by massive layers of timber, he may safely venture to build on quicksand or soils of a soft character. Or piles, supporting a thick layer of concrete, may be equally as good and less expensive. The amount of weight that a square foot of foundation will bear on such a soil must be known before any plan or specification can be made, and if the safe-bearing power of quicksand is from $\frac{1}{2}$ to 1 ton per square foot, it will be easy to determine the spread of the foundation. Speaking of foundations, the methods of increasing the bearing power of soils are several, such as increasing the depth, draining the soil, piling, compacting by stone or short piles, layers of sand, and any one of these would suggest itself to the practical man. The area required for a foundation to bear safely a given weight can be determined by dividing the latter by the safe load per foot. The weight in lbs. per cubic foot of masonry, the maximum horizontal pressure of wind, the effect of wind on towers and chimneys, square and round, are points at once grasped by the practical designer of structures, and are thought of when the foundations are being considered. The maximum pressure per unit of area on the side of the foundation which has the centre of pressure would be a necessary fact. Certain equations will give the actual pressure on both sides of the structure.

Loads, or the weights borne by floors and girders, are of necessity important data, which the architect should remember almost as well as he does his multiplication table. It may be as well to remember, for instance, that the weight of a dwelling-floor, including the movable load on it, is about 20lb. per square foot; that of public buildings 45 to 50lb. per foot; that of warehouse-floors from 150 to 200lb. per square foot. The floors of crowded theatres, churches, or assembly halls have often the same amount of weight upon them as the last. Then there are the weights of roofs for different materials and angles.

In estimating, the practical architect has considerable advantage over him who has not gone farther than the design of buildings. After all, *cost* is an important factor, and one which ordinary architects cannot afford to treat with indifference. To be able to talk about a building in relation to the number of rods or yards of brickwork or masonry, cubic feet of timber, and superficial extent of flooring it contains, is a great aid, however commonplace. To be able to look at a design as a matter of quantities and prices is to take a rather low view of the art, but it is one of essential value to the architect in practice. The art architect is satisfied if he can anticipate the ultimate effect—he looks at the design as a completed whole, he is a synthesist; the quantity surveyor, on the contrary, analyses, and to his mind the design is resolved into items of masonry, joinery, and other trades.

The knack of analysing trades is of unquestionable value; but it is a neglected branch. The data for estimating the amounts of ingredients to produce any required quantity of mortar may be mentioned. Very few are prepared with this knowledge from experience. To know, for instance, how many cubic yards of mortar can be made from a barrel of lime paste and three barrels of sand is one of the things a practical man has at his finger-ends. He knows it will make about half a cubic yard. He also knows at a guess how much mortar is required for a cubic yard of stone walling or brickwork; that in close-joint ashlar the proportion of mortar to the cube yard is only ·04, while in brickwork with ordinary joints the quantity of mortar will be ·35 to ·40 of a yard, the same as for rough rubble. The analysis of the cost of a cubic yard of mortar, or of brickwork, each depending on the quantities of ingredients or brick used is one of those mental qualifications which distinguish the practical from the theoretical man. Every locality will, of course, differ in some respects as to labour, cost of material, size of bricks; but in estimating some general data can be obtained. Thus a thousand bricks will require ·80 to ·90 of a cubic yard of mortar if laid with ordinary thickness of joint, and only ·45 to ·55 if the joints are but $\frac{1}{4}$in. thick.

The practical architect knows not only how to analyse his building into quantities, but he can specify with accuracy. How very few can do this? We know architects who get their quantity surveyors to write the specification, or even depute their clerk to copy a form and fill in the requirements. To write a specification properly a man must know not only the qualities of materials, but the methods of workmanship and labour required. How, for instance, can a specification of brickwork be written, unless the writer knows the manufacture and qualities of bricks, their composition and strength, the composition and qualities of limes and cements, bond, and the principles of masonry? Still less possible is it to write a good specification of joiner's work without knowing the market brands and qualities of timber, deals, and battens, the operations of joinery, and the requirements of good construction, in addition to the requirements of the building and special class of fittings.

The increasing number of manufactures and specialities connected with building form an important branch of the practical architect's equipment. Take, for example, terra-cotta. Up to the present time the architect has been obliged to rely on the manufactures of imperfect quality. Shrinkage in burning, delay in obtaining the blocks, twisted lines, are some of the accidents which attend this class of material. The modeller and the pattern-maker have been confined to operations which do not affect the actual results. The hollow blocks turned out of the kiln with seams and imperfections of form are filled up with concrete, which expands and fractures them. Now the skilled labour, formerly expended in making moulds, is employed in working and perfecting the actual clay block as if it were a block of stone, and by the patented improvements of Messrs. Doulton and Co. the blocks are turned out like wrought stone, ready for fixing without the "doctoring up" and chiselling to which they are generally subjected after burning. The most delicate mouldings, mullions, cornices, and tracery can be produced, and glazed to suit the surface and colour desired by the architect. The mode of manufacture which substitutes a solid perforated block for the hollow concrete-filled form, and which subjects it

to mechanical pressure while in the moist clay and to various finishing processes, has rendered it possible for the architect to use terracotta just as he does stone, to employ it for shafts and in the most delicate works without the slightest fear of its failure. Only those who take the trouble to keep pace with improved processes and appliances are able to obtain the most successful results.

INACCURATE PLANS.

IS an architect liable for any incorrectness in his plans? From the general view held amongst the profession no very definite opinion can be gathered. Errors due to negligence are not usually of very considerable moment, and are often discovered before any cost has been incurred. Extras may be allowed in some cases, as, for example, should the foundations require to be taken down to a lower level than shown on the sections, or a wall made thicker than shown on the plans. It would be absurd to contend that the architect's plans and specifications should be perfect under all circumstances, or that no deviations should be found necessary to be made from them. Hence it is laid down that an employer is not liable for mistakes in plans and specifications, no warranty being implied on the part of the employer. The case of "Thorn v. Lord Mayor of London," where the plaintiff entered into a contract with the City authorities to construct a bridge over the Thames according to certain plans and specifications prepared by the engineer of the Corporation, is cited. It was found that the method proposed in the plans of forming the caissons and foundations could not be carried out, and the contractor adopted another plan, with the consent of the engineer, and sought to recover the expenditure he had been put to in carrying out the plans. It was held there was no warranty on the part of the defendants that the plans could be carried out in all respects. This decision has perhaps given rise to an idea that the architect or engineer is exempted from any liability on this score; that as there is no warranty implied on the part of employer, therefore there is none implied on the part of the architect. But he stands in a different position in relation to the employer. He must display a "reasonable degree of skill and care," for if any damage is suffered by his employer on account of his negligence or want of skill he is held responsible. But we know that this liability is disputed by many. There is a generally received opinion that the architect does not warrant the correctness or practicability of his plans and specifications, or bills of quantities; that any errors or inaccuracies are pardonable unless they arise from fraudulent intention. Under this conviction we find clauses inserted which throw any discrepancy or mistake on the contractor, or do not hold the architect liable for errors found in any of the documents.

The law has certainly not expressed itself very clearly on the point in question. In one instance where a surveyor gave an inaccurate valuation for the purpose of mortgage, it was decided that he was liable for the loss occasioned to the firm who negotiated the advance on the strength of his valuation, the judge holding that if one supplies anything for a given purpose, he is liable independently of contract if the thing supplied is so unfitted for the purpose as to cause damage to the person using it. In this case there was no contract between the valuer and the negotiators of the advance; but the latter were losers, inasmuch as they advised their client to advance a sum of money to the mortgagor, who appointed the valuer. The bearing of this case on plans and other documents is evident. If the contractor has no case against the employer for inaccuracies in the plans and specification, he can claim against the architect for negligence or error in the preparation of documents upon which the tender has been based; also if he cannot show reasonable skill in the design or plans, or neglects to discharge his duty towards his employer, or allows improper materials to be used, he renders himself liable. These are disqualifications that a jury will have to assess at their proper value. The nature of the contract is the point that a judge and jury would take into consideration. If a client required a plan prepared for a particular purpose, and the architect failed to fulfil the intention, he would, no doubt, be held responsible; but if the plans were the joint result of employer and architect, and they did not answer the purpose intended, it is extremely doubtful whether the architect could be made responsible on the ruling in the case of "Hall v. Burke." In the majority of agreements, verbal or implied, between architects and their clients, the first-named assumption holds good. Plans and specifications are prepared for a certain building, the employer leaves the matter entirely to his professional adviser, and relies upon his skill and discharge of duty. The building is imperfect, or failure of some portion occurs owing to neglect, and the employer naturally seeks compensation or claims damages.

The importance of making a provision for errors or omissions in drawings which form part of a contract is obvious, and a clause to this effect should be included in the contract. The following is a form for one that has been suggested:—"The contractor agrees to make no claim against the proprietor in respect of any error, discrepancy, omission, or insufficiency in the said drawings, or on the ground that any portions of the works shown upon the said drawings are of unsuitable or of insufficient design, dimensions, or materials, and the said contractor agrees to supply and execute all additional materials and workmanship, if any, which may be required by reason of such errors, discrepancies, omissions, &c., and such shall be deemed to be part of the works to be done under this contract, and to be covered by the contract sum." A provision to this effect would save a great deal of after-disagreement by throwing the responsibility on the contractor, who, to protect himself, would be compelled in many cases to add a percentage for contingencies of this description, especially when the plans and specifications appeared to be hastily prepared or defective. We should rather be inclined to word the clause a little differently—to the effect that before signing the contract, the contractor should examine and compare plans and specifications, and point out any discrepancy, or omission, or insufficiency that he might discover in them to a view to their correction or explanation, no claim or allowance being made afterwards.

ARCHITECTURAL ASSOCIATION EXCURSION INTO OXFORDSHIRE.—III.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THURSDAY'S proceedings began by a railway journey to Witney, from whence, by carriages, the excursionists proceeded at once to *Minster Lovell*, which lies to the right in a hollow below the main road to Burford. *Minster* originally was the name of the place, but the venerable priory, now in ruins, obtained its name from its foundress, Maude Lovell, in the reign of King John. Lord Lovell built his seat here in A.D. 1400. His successor, Francis Viscount Lovell, a Lancastrian, became odious to his party by taking office under Richard III., hence the rhyme which led to the execution of its author, William Collingbourne, a Wiltshire sheriff:—"The cat, the rat, and *Lovell that dog*, rule all England under the hog." He was attainted on the accession of Henry VII., but escaped and fled to Flanders. In 1487 he returned, but his fate has never been clearly ascertained. C memorandum as to finding his skeleton (a large vault underground at Minster L given in the history of the place. The house has no trace of a military charac being so entirely ruined now has little the refectory windows of immediate int the architect. The church, however, is r able on account of the central tower wh plan, is smaller than the space formed at tersection of the cross, and the chancel is n than the nave. Four piers—two entir tached and two partly so—support th inside the main walls, with which they a nected by a small diagonally-set arch case, forming, as it were, four hagioscopes views either way from the nave into th septs, and from them into the choir. The space is groined, and the effect inside is ingly elegant and suggestive. We ga sketches of the church and a plan last we Mr. Pite's sketch book. Mr. J. L. P R.A., restored the church and added th pulpit and reredos. The founder's (rich tomb stands in the south transept, and stalls remain in the nave and are admi plain examples. The tomb, though wel for in so far as further mutilation is conce in urgent need of repair, or the side tow south will fall out with the capping no loose.

Asthall, still on the road to Burford, miles from Witney, was next seen. We view of the church and manor house las taken from the farmyard to the right of t road. The church, dedicated to St. N has been rather over-restored (1884), some time or other, the floor of the nave h considerably raised, the bases of the arca being almost buried. Adjoining the ch parclose, or chantry, and underneath what coarse cinque-foiled arch. In th wall of this chapel reclines an effigy Corbett, who, in the court of Henry II., similar position to that assumed by the of Portsmouth as the paramour of the " Charles. Two lights of the window ab tomb are filled with the original glas ancient stone altar in this church occu proper position, and a shrine, or chantr in the north transept remains *in situ*. wood in pulpit is a good piece of solid work; but the sanctus bell turret is ve The cross over the porch, which fig Parker's "Glossary," is much broken church is well cared for. The ts then paid the usual fee of a ch charged to the public, and like cheap-trippers" entered the great nspect the Duke of Marlborough's magnificent house, Blenheim Palace. and clever monstrous and grand man- r John Vanburgh's biggest work, and, masterpiece. He obtained the com- rough the fame he had won by his at Castle Howard. The Palace was in 1705, and in 1714 no less than ad been paid by the Treasury, while, sum, about £60,000 were due by the ccount of the undertaking. The shell mpleted when Queen Anne died, and l monument of the glorious actions of hill, Duke of Marlborough, for whose ver the allied armies of the French and Bavarians a grateful people had determined to erect a worthy home, was ultimately left unpaid for. Parliament ignored its liability, and the projected palace was finished after Marlborough's death out of private moneys which he provided for the purpose—some £10,000 a year, which Vanbrugh said the duke had left for the duchess "to spoil Blenheim in her own way." The history of the building bristles with petty squabbles, ducal niggardliness, and malicious malpractices. Vanbrugh was very badly treated, spending much of his own means to carry on the work; he never even received his fees, while he also lost his capital, besides his salary. The duchess, that termagant "old Sarah," at last became so bitter in her treatment of the architect that she wrote an order refusing to permit him to inspect the execution of his design. Many of the workmen also never received their wages. The duke died before his house was finished. The plan of the palace itself is well known, and its architecture is unquestionably imposing, from its great size, scale, and varied outline, though excessively heavy and overladen with massive detail. The general effect gave occasion to the architect's epitaph: "Lie heavy on him, Earth, for he laid many a heavy load on thee." The house forms three sides of a square, inclosing a court, and the quadrangle is entered from the east side by an arch, decorated with an emblematic sculpture of a lion grappling with a cock. The hall extends the whole height of the building, with Thornhill's ceiling, illustrating, in an allegorical fashion, the Battle of Blenheim. This interior is exceedingly imposing, and must be acknowledged a work of taste and good proportion, in which there is a considerable reserve exhibited, considering the circumstances under which it was designed and the age in which it was built. The great dining-room is filled with pictures by Rubens and Vandyke, with tapestries illustrative of Marlborough's exploits. The furniture is rich to a degree, and the old china in the cabinets was used in the Court of Queen Anne. The saloon, with walls and ceiling—a masterpiece by Laguerre, painted in imitation of relief, is an unsurpassed work of its kind with architecture. The state drawing-room, enriched with tapestry, painted on in perspective, is less spacious, but well-harmonises with the rest; and the library, 183ft. long, occupying the S.W. front, and originally intended as a picture gallery, is an exceedingly spacious and highly elaborated apartment, containing comparatively few books. The grand new organ, to stand in the centre bay of this library, is in course of construction from the designs of Mr. Romaine Walker. A drawing of the instrument was illustrated by an elevation at the Royal Academy Exhibition, just closed. The chapel of the palace was also seen. The Ionic Temple of Diana in the private garden was designed by Sir Wm. Chambers. The new boat-house was illustrated in the BUILDING NEWS, April 5, 1889.

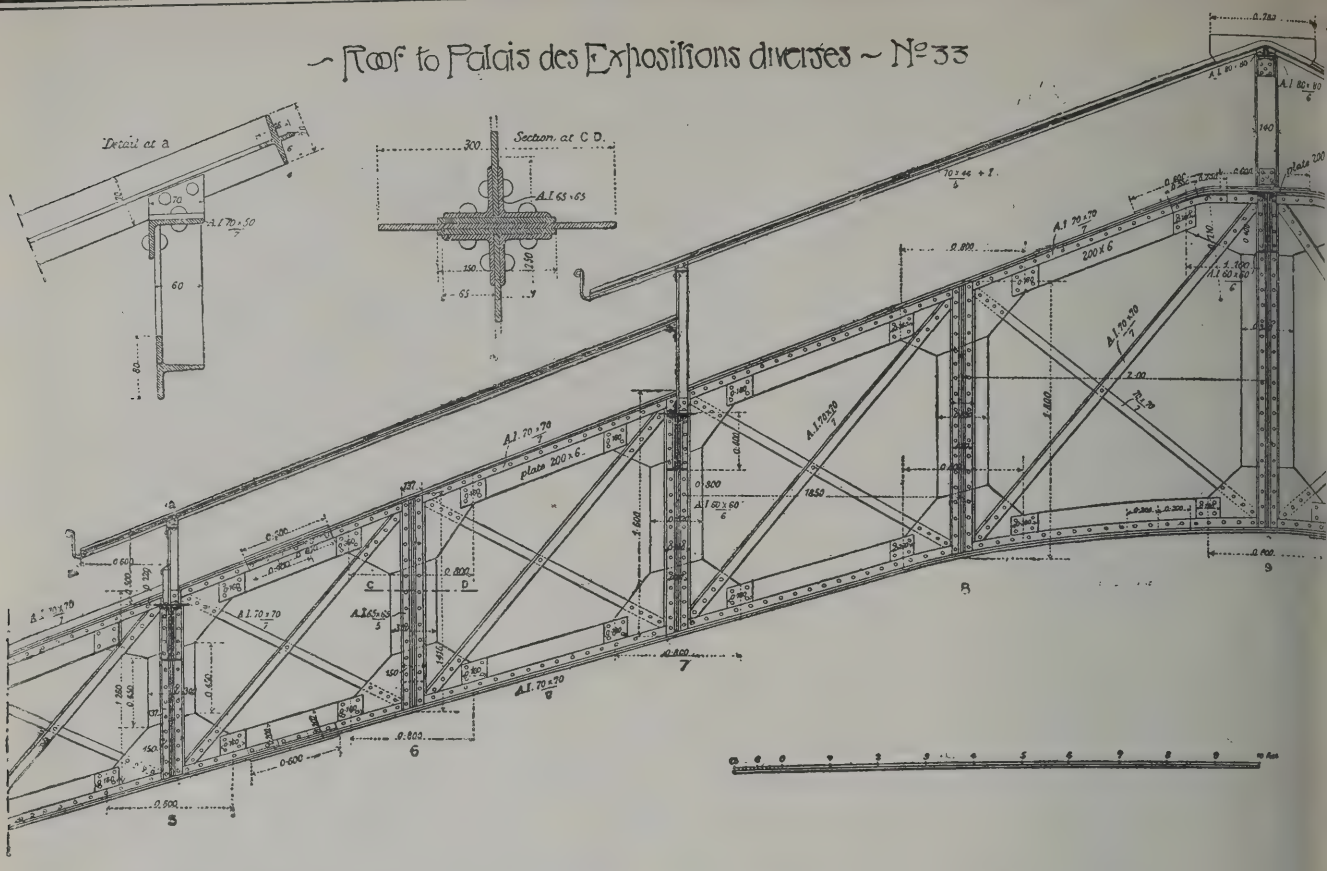
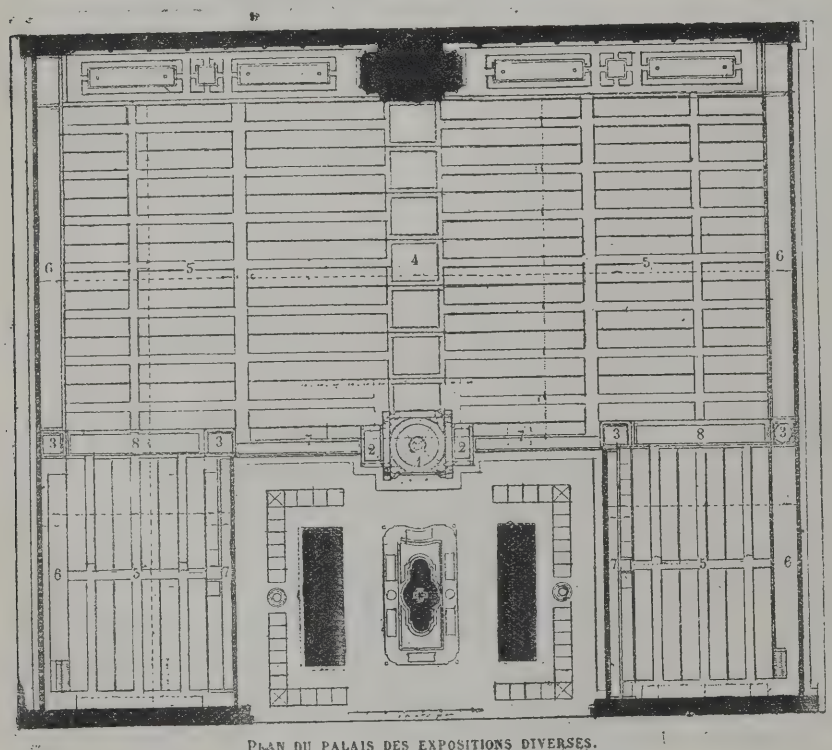
The church of *St. Mary Kidlington*, about a mile east of Woodstock-road, is a large cruciform building with a central tower and sleek spire. The building is chiefly Decorated in style, and has some admirable specimens of Late Gothic work about it, such as the three-light east window of the north transept with good niches for figures in the reveals inside on corbels. The cinque-foiled and ogre-headed piscina by the side shows the connection of the window with an altar. There was also an altar in the south transept under the east window with a recess for a sedile. Over the lofty nave is a Perpendicular clerestory with a contemporary roof, and, as at Coggs, which we illustrated last week, the arcade has no caps. The chancel inclines very much on plan towards the south. It contains some old plain stalls with fronts made up of ancient bench-ends. The chapel south of the choir has an extremely beautiful Decorated four-light window, with a carved man's head in the centre of the rose of the head. In this chapel are some good incised memorial slabs of simple design, with fillings of black and red mastic, dated 1665. The pulpit is of carved oak dating from Elizabeth. The absence of an aisle on the north gives an unusual elevation outside. Close to the church is a small hospital or almshouse, erected by Sir Wm. Morton, 1671; but the building is of no special interest beyond being simple and suitable.

Water Eaton Manor House, seen next, stands near the Cherwell and dates from James I. when it was built, though it looks of earlier workmanship with Tudor-like windows. The nave of the chapel is 25ft. long and the chancel 16ft. The fittings are in a Renaissance style with poppy-heads to the pew-ends; a very good screen and capital pulpit. The house to which the chapel belongs is a perfect specimen of the Elizabethan period, with its courtyard, entrance gate, and detached wing all in their original state; over the entrance is the date 1585. Lord Lovelace lived here during the Civil War, and the place must have been of some importance at one time. Now it stands over the fields away from the high road, with only a rough track leading to it, and is used as a farm-house. The building is, however, well cared for, and contains some good panelling in the large rooms. In detail the work is coarse but effective. Here, in front of the house, Mr. J. A. Robinson photographed a group of the party, about thirty in number. With Water Eaton, one of the most interesting pieces of domestic work seen during the week, closed the excursion of Friday, and an early start home was made by the coaches to be in time for the final dinner at the Mitre Hotel in Oxford. The proceedings suffered considerably from the absence of the older members of the excursion party, who in past years have contributed so much to the success of these occasions. No guests were invited, and although the usual toasts were carried with enthusiasm, there was an evident want of heartiness, which was accounted for by one speaker from Ireland as due to the "absence of so many familiar old faces which he saw around him." This bull brought down the house, but the evening was not a success. On Saturday some of the party left early, but others remained to inspect the remainder of the colleges not seen on Monday, including St. John's College, where Inigo Jones's arcaded building affords unquestionably the gem of Renaissance work within the limits of the University, and illustrates his power and refined skill as a cultured architect who had studied the buildings of Florence to advantage. We shall illustrate a drawing of one of the doorways from this college next week, from the pencil of Mr. Phené Spiers. Worcester College was also seen, with its beautiful decorations and fittings, erected about 28 years ago from the designs of the late William Burges, that Master of Gothic design. Here his work in the Renaissance shows what a genius of detail he was, and how thoroughly he carried out his labour of love, making the thought prevalent in it throughout the keynote of one vast Te Deum, working in all created things in his scheme. Time has toned the work down here as in the great hall of the same college, which he also decorated; but his art is living still, replete with personality perhaps, but as thorough and as true as the artist was himself. His glass here is the least successful part of the work he did. The gardens of this college are among the most charming in the city.

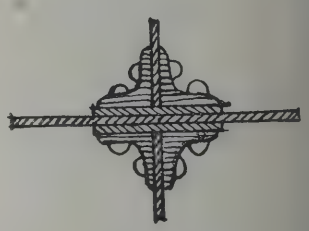


Among the accompanying sketches is a view of the Pilgrim House at Deddington, visited by the Association on the Banbury excursion. It stands close to the church, and has some nice detail about it. Inside in the tower of the house, is a curious old wooden staircase with square newels of Jacobean character, well worth a note in any architect's sketch-book. From Wroxton Church, visited on the same occasion, we give a bit of iron railing from the tomb of William Pope, dated 1631, and from Hanwell Church, an odd old English font cover, which some people managed to admire. The fittings of the churches of Oxfordshire will not compare with those of Norfolk, more particularly with those seen by the Architectural Association last year round King's Lynn; but the buildings themselves are, on the whole, far better cared for than in East Anglia, and generally speaking, the restoration work has been well carried out. The two pulpits illustrated to-day from the Latin Chapel of Christ Church Cathedral, and the Convocation House, Oxford, are shown from two admirable pencil drawings lent us by Mr. T. Maclaren.



CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—X.

By BANISTER FLETCHER, JUN., A.R.I.B.A.



PALAIS DES INDUSTRIES DIVERSES.

THE building which has been set apart for Groupes divers Français and Groups divers Etrangers is formed of one large division and two wings, which join the Galeries Rapp and Desaix respectively. The main building is given up almost entirely to French industries, the wings

Standards to Roof

to foreign countries (see No. 31 from *L'Architecture*).

The Palais does not touch the Machinery Hall, but is separated from it by an open space, which is roofed in and now used for an exhibition of railway carriages. The main building, which extends the whole width of the Champ de Mars, is 1,344ft. long by 626ft. wide, and the wings, which are on the same central axis as the Fine Arts and Liberal Arts building, are 403ft. long by 344ft. wide. The main building is, however, divided down its centre in the central axis of the Champ de Mars by a gallery called the 30-mètre gallery, from which gallery, by entrances of different design, on which great care has been bestowed by the architects, access is obtained to all the French manufacturing industries. The main building is composed of ridge-and-furrow roofing of the type shown, of which there are seven bays running east and west on each side of the "30-mètre gallery." There are 21 intervals between the principals in each of the seven bays on each side of the 30-mètre gallery to the main division, and 16 divisions in each of the three bays to the wings. The roofs have a span of 82ft. centre to centre of standards. The main division is connected to the wings by a vestibule 49ft. in width, running at right angles to the axis of the Champ de Mars, across the centre of the central dome, with four junction domes along its length. The roofs to the wings of the "Palais des Expositions Diverses" are of the same form as those to the "Palais" itself. All round the open space in front of the Palais there are restaurants formed, abutting on the open space, with decorated terracotta friezes above the columns; these restaurants have cellars them. Considering the roofs and their su and first of all their supports, we find (see and 33 from *Engineering*) that they are iron standards, measuring about 2ft. 1½in. by 1ft with plates of the latter width ·35in. thick front, they are formed of iron lattic framing, with angle irons 2¾in. by 2¾in. by horizontal angle irons (double, see d 2·36in. by 2·36in. by ·24in., and diagona 2·36in. by ·24in., attached by gusset at the angles to the angle-irons (N These standards are 26ft. high, and are about 82ft. apart. The height fr ground to the top of the roof-truss To the top of the purlins, of which there on each side of the ridge purlin, are sect double rafters which support the heavy

rn and the roof covering, which is f match-boarding and zinc sheeting. ters are 1ft. 7in. apart. The venti- ffected by the upper and lower portions of the lantern being filled with ventilators. It will be seen that the roof-truss is formed of "uprights (No. 34) composed of a wide web with a covering piece on each side, and the whole riveted together by two angle-irons on each side with a plate between them. The cross bracing is composed of angle-irons bolted on each side of the web.

NOTES ON BUILDING PRICES.—VI.

By John Leaning.

It is commonly the practice in a bill of quantities, or a properly prepared specification, to define the treatment of provisional sums, in respect of packing, carriage, profit, and fixing. Provisions will be found either all together at the beginning of the specification or bill of quantities, or at the end of the particular trade to which they may be referred. Sometimes such list has at its head: "On all things for which a sum is provided, allow for packing and carriage." When no specific mention of these occur, they may properly be considered as included in the provisional sum. A clause should settle the question of trade discounts. The following will do it:

"If contractor desires a profit on any of the following provisional sums, he is to add it to the sum in each case, and such of these amounts as are not used will be deducted with such profits from the amount of contract. P.C. or net cost shall mean the net-cost after deducting from the list-price the trade discount; but not the discount for cash."

In some specifications or quantities a view quite different to that here taken is set forth, as follows: "In all cases where letters 'P.C.' are made use of in this specification, they are intended to imply the published catalogue price; and the architect shall be empowered, if he thinks proper, to order the articles of any special manufacturer to the full value of sum named."

Another mode of treatment is provided for thus: "All provisional items shall include 10 per cent. profit for the contractor, calculated on the net amount after deducting the trade discount."

In default of a definition clause, it is often maintained that "P.C.," or "prime cost," means trade list price—unreasonably enough; but the contention is often successful. In these times of close competition, many builders put no profit on provisional sums, trusting to their native ingenuity to cajole or delude the architect, or reckoning upon his ignorance of trade usage to get the trade discount. If a contractor wants profit, this is not always safe. On such an item as the following it is generally admitted that a profit will be allowed on the measured items which go to make up that expenditure, and no profit need be added: "Provide for extra works £50." Sometimes a number in trade list and list price is quoted; but a definition of prime cost is none the less necessary, for the purpose of adjustment of accounts.

THE CHARGES OF VESTRIES AND DISTRICT BOARDS OF WORKS.

The Metropolitan Vestries and District Boards almost uniformly require an application on a printed form in duplicate supplied by them, on which must be drawn a block plan of the building and drains. One copy is retained by the authority; the other returned to the builder, with the official permission. In the country the Local Board of Health generally requires a drain plan, and sometimes a fee; but often it does not. Reference to the local by-laws will furnish all necessary information, and the by-laws of some municipalities empower them to require the whole set of drawings of a proposed building to be submitted for approval. Whether the building be in town or country, the estimator should include a small charge in his estimate for the preparation of this plan. Nearly all the vestries, district boards, and local boards of health have some kind of printed regulations in some such form as the following:—

The Board of Works for the ——— District.

METROPOLIS LOCAL MANAGEMENT ACTS.

Regulations for the Drainage of Houses.

1. Every person applying to the Board for permission to execute any drainage works shall furnish a plan of the whole of the premises to be drained, drawn to a scale of 1in. to 8ft. Such application and plan shall be on a printed form to be obtained at the office of the surveyor for the parish, and must show by lines and figures the positions and sizes of the proposed drains; also the depth of the basement below the surface of the road, and all other necessary particulars. No drain is to be laid without being first approved by the Board, and before commencing to lay the same 24 hours' notice is to be given at the office of such surveyor.

2. Every part of every drain shall be laid with a fall of not less than 1in. in 4ft., and no basement is to be built lower than will admit of such fall.

3. All drains shall be constructed of good, sound, glazed, stoneware pipes, and jointed with cement, unless special patent joints or iron pipes are used; the joints must be made water-tight, and that part of the drain laid near or under the house or other building shall be surrounded with concrete.

4. The person executing such drainage works shall give notice to the surveyor that the drains are laid, and every part of such drain shall remain uncovered until such surveyor or other authorised officer of the Board, shall have examined the same and sanctioned its being covered up, such examination to be made within 24 hours after such notice shall have been given. The officer inspecting shall, if he think fit, require the person executing such drainage works to fill in the drain under the inspection of such officer. An entry shall be made by such surveyor or other officer that such examination has been made in a register to be provided for the purpose.

5. Each drain shall be cut off from the main sewer by a ventilated intercepting trap, provided with means of inspection; such trap to be marked T on plan. The opening for ventilation to be situated on that side of the trap nearest the building.

6. Every drain shall be well and effectually ventilated by means of iron or lead pipes not less than 3in. in diameter, without bends or angles if possible, fitted with air-tight joints, and shall discharge into the open air at the highest convenient point, clear of windows or other openings and of chimneys; such pipes to be marked V on plan.

7. All drain connections shall be formed with curved or oblique junctions.

8. All houses and premises shall be well and sufficiently supplied with water. The cisterns, services, supply pipes, and all other fittings shall be so arranged that it shall not be possible to draw water for drinking, culinary, or other domestic purposes from any cistern or pipe supplying a water-closet, slop-sink, or urinal. Every cistern shall be fixed in an accessible position for cleansing, and shall be provided with a close-fitting cover.

9. Water-closets shall be lighted direct from and ventilated direct into the open air. Every water-closet apparatus is to be self-cleansing, provided with an adequate flush of water and a ventilated siphon-trap connected to the soil-pipe by means of a sound and suitable joint. All soil-pipes to be constructed of lead or iron, with air-tight joints, ventilated, connected direct with the drain without a siphon trap, and a far as possible fixed outside the building. If the soil-pipe is of necessity placed inside, it must be of lead. Such pipe to be marked W on plan.

10. Waste pipes from sinks, baths, lavatories, or other such places shall be trapped at the outgo of the receptacle and made to discharge outside over gully traps. Waste pipes from cisterns and from safes shall discharge into the open air.

11. Every rain-water pipe shall be made to discharge above the water-level of a stoneware siphon gully. Such pipes to be marked R on plan.

12. Subject to the foregoing regulations, all the materials used and the workmanship employed shall be such as the surveyor shall approve, and his directions in these respects and as to the general construction, execution, and conduct of the work shall be implicitly followed.

Clerk to the Board.

Some of them also issue to builders applying for permission to build or drain a schedule of the rates they charge for the work they do. Most of the Metropolitan authorities supply and lay the drain from the sewer as far as the front walls of forecourt, vault, or house. Some only connect with sewer, and lay two or three lengths of pipe, and they all reinstate the road and footway. In the country the practice varies in all manner of ways. The usual process after application made is for the surveyor to estimate the value of drain and making good paving and road, and to inform the builder, who deposits the amount before commencing the work. If the deposited sum exceeds the expenditure the balance is returned. Generally the charges are based upon a schedule of prices, which is tendered upon periodically. The contractors work under it, being supervised by an officer of the local authority; in other cases the vestry buys its materials and employs its own workmen. In thoroughfares paved with asphalte or wood blocks, the paving is done by special con for such work, who generally have a s contract with the Board. It may be that the charge for work done by a local vestry will be about 10 per cent. beyon would cost the builder. The average ch a hoarding license is 2s. 6d. per month. vestries charge 2s. 6d. at each renewal, o not. In London, and in many provincia there is a growing disposition to refus cations for cellar-flaps, rolling ways, an and when granted it is under a special ag which treats them as temporary easem vocable by reasonable notice. The list of and district boards in London may be the "London Post-Office Directory." the work is in the country, the estimat invariably apply to the local authority fo of the by-laws before he completes his All the information about local author their charges should be carefully pres good order for future use. In making mate, some considerations will arise local powers, which will require t differing according to circumstances. quantities are supplied, the architect quantity surveyor are expected to pr the construction and arrangement req the local authorities, and all the has to do is to attach prices. quantities are a part of the contr neglect of this foresight will probab extra work, for which the builder will vide, and which must be paid for by the owner. When the quantities are supp are not part of the contract, the condit (as they might in the first case) proba prise an obligation to conform to the local consideration of them has been neglect surveyor, so as to involve extra wor builder, the surveyor would probably for their cost, and the estimator pricin might disregard them equally with case; but when the estimator is prep estimate from drawings and a specifi which such a condition appears, he s attention to anything discordant with dition and have it rectified, or the bu possibly have to do such work for When there is no condition of the estimator may, if he chooses, merely the drawings and specification accordin they express. Often he does choose th as the candid man, by drawing atten providing for the lapse of the architect, a higher amount of tender than anothe studiously ignored everything he was to notice; it is obvious, therefore, that with local by-laws and regulations is Those of the parishes and district boa practice differs from the general ru mentioned are as follows, and the ch assist the estimator; but many of th have no printed scale of charges:—

St. Olave:—

New York paving, laid per foot superfici
Roadway paving relaid and grouted, per superficial .....
Footway reinstated, per foot superficial
Concrete, cubic yard .....
Cartage, per load .....

St. Marylebone:—

York paving relaid, per yard superficial
Granite pitching ,,
Concrete ,,
Wood paving ,,
Macadam ,,

The vestry makes the connection and lays the drain between it an charging the cost of the work with of ten per cent.

St. George's in the East:—

Reinstating footway, per foot superficia
New paving and laying ,,

Greenwich.—New gratings or flap ways not allowed; but, subject t vertical flaps below stall-boards a inwards are allowed. Deposit for sc each house front, £1, returned if wo factorily reinstated.

Battersea.—License for hoard.....

Charlton, Eltham, Kidbrook, Lee, stead.—The practice as to drains is In Lee and Plumstead the auth on doing the work themselves. In ing sections of the district the su their discretion as to whether the d

lder shall do it, and, if the latter, under
n.

(*To be continued.*)

ARCHÆOLOGY IN INDIA*.

THE work of the Archæological Survey has made good progress during the year, though it is to be feared that the retirement of the Director, Dr. James Burgess, C.I.E., may check the advancement of this important work. I believe, however, that good arrangements have been made for carrying on the surveys now in progress, and that Dr. Burgess will continue to edit the reports. The first volume of the new series of reports, brought out in India under Dr. Burgess's superintendence, of the Archæological Surveys in the N.W. Provinces and Oudh, containing Dr. Führer and Mr. Edmd. Smith's report on the Sharqî Architecture of Jaunpûr, which was alluded to in last year's address as under preparation, has been published. It is a valuable contribution to the history of Mohammedan architecture, and in point of get up may fairly be said to compare well with similar publications printed in Europe. In a valuable paper read before the International Congress of Orientalists, held at Stockholm, Dr. Burgess has given an account of the rise and progress of archæological studies in this country, and of the work of the Archæological Surveys in Northern, Western, and Southern India, and the publication of the results so far as issued. The materials on hand are very considerable and most important, and four volumes could be put in hand at once, were the means forthcoming, as it is to be hoped they will be. From the paper it appears that with Dr. Burgess's retirement the five survey circles for all India are to be reduced to three, under properly qualified surveys, with one or two specialists for epigraphy. The munificent aid rendered by the Mahârâjâs of Barodá and Jeypore, in bringing out illustrated works on the architectural remains in their territories, is specially noticed, and the hope is expressed that others may follow their good example. The architectural section of the Archæological Survey, North-Western Provinces and Oudh Circles, under Mr. Edmd. W. Smith, from January to April, 1889, made a complete survey, including plans, elevations, sections, and details: (1) At Orchhâ, near Jhânsî, of the splendid temple Chaturbhuj, Bîr Singh Dêo's tomb, the fine massive entrance gates leading to the palace, and a fine bâoli on the banks of Betwâ, as well as of another at Chardvârî, four miles distant from the city; (2) at Lalitpûr, of the Bânsâ Masjid, part of an old Hindû temple; (3) at Dêogarh on the Betwâ, in the Lalitpûr district, of the Gutpa temple in the plain below the fort, and the extensive group of Jaina temples inside the deserted fort. Since October, 1889, the architectural section has been at Fatehpûr Sîkrî, near Agra, and has at present fully illustrated the Panch Mahal, Miriyâm's Kothí, or house, and Díwân-i-Khas, or council chamber. Dr. Führer, after having closed, in the middle of February, 1889, his excavations at Mathurâ, which yielded, among other valuable relics, some very important Jaina inscriptions of the Indo-Scythian period, joined the architectural section and visited the Lalitpûr district. A careful search along the banks of the Betwâ at Dêogarh brought to light several Gupta rock-inscriptions, hitherto unknown. In the beginning of November he started a tour near Farrukhâbâd, Mainpurî, Agrâ, and Mathurâ districts, and is at present engaged in a complete excavation of the Kankâlî Tîlâ at Mathurá. To the east of the Svetâmbara temple of the first century, whose foundations were disclosed last year, Dr. Führer unearthed a well-preserved brick stûpa of 18½ft. diameter, some 25ft. below the present surface of the soil. This stûpa—it appears from an inscription found on the spot—is the relic stûpa which was standing inside the Upagupta monastery, mentioned by Hiuen Tsiang. Vol. I. of the Reports of the Archæological Survey in the North-Western Provinces and Oudh.—"The Sharqî Architecture of Jaunpûr," by Dr. A. Führer and Mr. Edmd. W. Smith, already noticed, was issued in August last; Vol. II.—"The Monumental Antiquities and Inscriptions in the North-Western Provinces and Oudh," by Dr. A. Führer, will be published in March next; Vol. III.—"The Chandella Architecture of Bundelkhand," by Mr. Edmd. W. Smith—is now in the press. The Archæological Survey party in Western India, under Mr. H. Cousens, having completed the survey of Bîjâpur, moved to Pâlitâna, in Kâthiâwâd, and completed the survey of the Jaina temples which crown the sacred hill of Satrunjáya. There is very little that can be called ancient, but the vast congregation of temples and shrines which crown the hill makes the place unique and worthy of attention. The whole ritual of Jaina worship may be seen on the hill, and a complete knowledge of its iconography can be gained by a close inspection of its hundreds of images. During January and February last, a Buddhist stûpa, situated in the forest near Junagadh, was opened by the Junagarh authorities under the guidance of Mr. James Campbell, C.S., and the searchers were rewarded by the discovery, about the middle of the mound, of the relic, with its inclosing caskets of stone, copper, silver, and gold. The nature of the relic has not been decided—it is a small chip, or flake, about ⅜in. long by ¼in. broad, of some brown hard substance which closely resembles stone that has been under the action of fire. No inscription or coin was found that might have thrown some light upon it; but fragments of a Buddhist rail and umbrella in stone were unearthed during the excavation. Mr. Cousens has favoured me with a copy of the report of this find, which, I hope, will be published in the Journal. A considerable number of drawings, photographs, and facsimiles of inscriptions were made during the field season. The guide book to the ruins of Bîjâpûr, by Mr. Cousens, to which reference was made last year, has been published, and is a handsomely got-up little volume, which will be of great assistance to visitors to the ruins and to archæological students. The party is now in Gujarât, visiting the outlying parts of the Barodâ territory, in order to complete the material required for a second volume on the antiquarian remains in H. H. Gaikwad's dominions. A volume on the Chalukyan remains in the Kanarese country is now almost ready for the press, and the full accounts of Bîjâpûr and Satrunjáya are to follow, they being now in hand. The Archæological Survey, Southern India, during the last field season, under Mr. A. Rea, after visiting Pulicat, Nellore, and Juvaludinne, resumed excavation at the Franguladinne stûpa, near Pedda Ganjam, as noted last year. Proceeding thence to Chezarla, some very important and interesting remains of the Early Buddhist period were discovered. They include some important inscriptions on marble and a Buddhist structural chaitya, the largest and most complete of the four yet found in India, of which three were discovered by Mr. Rea. The temple is quite complete and is used for worship by the Hindûs. Some remains were inspected at Kamapalle and some mounds at Bamdem. At Garikipad Agraharam a mound was excavated, and an early Buddhist stûpa was found, with a large number of archaic marble sculptures. It is one of the most ancient as yet discovered in the Madras Presidency, dating from about, or before, the Christian era. After visiting an old mound at Ochchampet, Mr. Rea returned to Amrávati and resumed excavations at the stûpa. Remains of outlying buildings in connection with the great stûpa were dug out, and a number of other marble sculptures, relic caskets, coins, and other objects found. From Amrávati, Vaikanthapuram and Pedda Naddur were visited, and at each place unknown Buddhist remains were found on the hills. On a hill at the latter place a most important discovery was made of the stûpa and monastery, which is mentioned by Hiuen Tsiang as being near Amrávati, and has hitherto been sought for in vain by archæologists. Excavation was then resumed at Gantupalle; some sculptured relics and a miscellaneous collection of objects were found. An excavation in one of the largest of the mounds brought to light a large and very complete Buddhist chaitya, with some unusual arrangements of plan and some curious brickwork in its construction. Some marble statues were found in it. It is a very important addition to the few Buddhist structural temples which have as yet been discovered. It is satisfactory to know that measures are being taken for the proper conservancy of the interesting remains in the Krishna district, and a very complete report of them is under preparation. The mounds have been catalogued, and orders issued for their conservation. Since the above address was delivered Mr. Edmd. W. Smith has surveyed, in detail, the splendid apartments erected at Fatehpûr Sikrî for the Turkish Sultana's use, casts of which are in the South Kensington Museum. During the next cold season Mr. Smith

* Extract from the Annual Address and Review delivered by the President, Col. J. Waterhouse, Assistant Surveyor-General of India, to the Asiatic Society of Bengal.

returns to Fatcepûr Sikrî, and proceeds with the survey of the city, which, as students of history will remember, was erected by the great Akbar during the years 1556—1605 A.D. Besides preparing drawings and reports on the architectural remains in and around Fatehpur Sikrî, Mr. Smith has taken a number of photographs and prepared casts of the detail ornamental façades. Hitherto we at home have been ignorant of the existence of a such useful and interesting department as the one lately reviewed by Col. Waterhouse in his address to the Asiatic Society of Bengal, but we hope from time to time to be able to record its labours and researches in our volumes, as we are convinced they will throw additional light upon the past architecture and history of one the most interesting and oldest countries in the world. It is gratifying to see that the Government of India is encouraging the study of ancient architecture and archæology, and it has decided to retain at least three out of the five circles employed on its survey operations.

CONTEMPORARY ART WORKERS AND MANUFACTURERS.

WE give to-day another sheet of portraits of living art workers and manufacturers.

Mr. Herbert Paul Williams, whose portrait occupies the top left-hand corner of our sheet, is the present senior partner of the firm of Pilkington and Co., Asphalte Manufacturers and importers; he is the son of the late Mr. Michael Williams, whose death we recently recorded, and was born in March, 1860. He commenced his connection with the firm in 1875, three years before the death of its founder, the late John Pilkington, the patentee of the well-known and extensively used system of asphalte roofing, combining the use of asphalte and felt, and also the sole manufacturer of "Polonceau asphalte" since 1838, when he commenced business in London. Previously to that he traded largely in asphalte in Liverpool. On his decease in 1878 the business devolved entirely on Mr. Michael Williams, who for 28 years had acted as managing partner. Of late years a great demand having arisen for a material suitable for paving, etc., which will resist the action of all acids, Mr. H. Neal Williams assiduously set to work, and calling in the assistance of a well-known chemist, after infinite labour and disappointment, at last succeeded in satisfactorily solving the problem, and placing in the market what is known as "Pilkington's Acid Resisting Asphalte," which is now very extensively used in laboratories, acid tanks, in the battery rooms of the electric-light stations, and elsewhere. Space will not permit of our giving at all a representative list of the places where the firm have laid their asphalte during the fifty-two years they have been in business in London, but we may mention the following as examples, viz.: St. Thomas's, St. Mary's, South London Ophthalmic, Evelina Children's and Stockwell small-pox and fever hospitals; Glamorganshire, Gloucestershire, and Kent-second county lunatic asylums; Stoneyhurst College, Salford; National Safe Deposit, London; Duke of Rutland's, Belvoir Castle; Baron Rothschild's, Waddesdon; Lord Sefton's, Croxteth; Marquis of Ailesbury's, Savernake; Lord Derby's, Holmwood; Colonel North's, Eltham; Carlisle Corporation Markets; Church of St. James, Spanish-place; new Council Chamber; Mayor's Court, Guildhall; Billingsgate Fish Market; Aylesbury Dairy Company, Bayswater, &c. The latest addition to the firm's trading operations has been the establishment of a branch for the supply of bricks, cements, slates, piles, terra-cotta, &c., which is under the immediate supervision of Mr. E. Graham Williams, who entered the firm as partner in March last.

Mr. John T. Bolding, whose portrait we give in the centre of the first row on our sheet, is proprietor of the establishment of John Bolding and Sons, Grosvenor Works, London. This business was founded by the grandfather of the present proprietor in 1822, and for many years afterwards carried on by his two sons, Messrs. Thomas Edward and John Lupton Bolding; the latter took his son, the subject of our notice, into partnership in the year 1868, and retired from the business in 1879, and is now nearly 80 years of age, enjoying excellent health and the rest he so well deserved. When the necessity for improved sanitary arrangements in our dwellings was introduced, this firm came to the front, and designed many improvements in the manufacture of water-closets, baths, and lavatories, and combined with these the good work, sound material, and excellent finish for which the firm was noted over half a century ago. The great disadvantage the present proprietor has had to contend with has been to get premises large enough in the neighbourhood of South Molton-street to meet his increased trade, consequently he has had to manufacture his goods in eleven different works. This difficulty has now been got over by the handsome block of premises being erected in Davies-street, within 10ft. of the present South Molton-street works, where the business was founded in 1822. A drawing of the premises is now being exhibited at the Royal Academy, and was illustrated by us in our issue of June 27. These premises, when completed, will contain over 30,000 superficial feet, and at Christmas next arrangements have been made to move eight of the eleven factories under this roof; the only works to be then carried on outside the new premises will be the brass foundry in Euston-road, the iron foundry in Birmingham, and the pottery works in Staffordshire. Mr. Bolding is assisted in his large establishment by a very able and painstaking staff, nearly all of whom entered his service as boys, and have grown up with the business; hence the harmonious way the work is carried on. A great number of the mechanics have been many years in the works, and after a certain number of years' service they have the privilege of introducing a son, who works with his father until he is efficient, when a place is found him in the factory. One of the most important advantages Messrs. Bolding and Sons' new premises will afford is the show-room, where an architect will be able to see on one floor every design in sanitary manufactures, from the ventilating cowl at the top of the building to the intercepting chamber in the area. The photograph is by Mr. Alexander Bassano, of 25, Old Bond-street.

Mr. William Lindsay, the third of to-day's series of portraits, is the head of the firm of William Lindsay and Co., 23, Queen Anne's-gate, Westminster, and patentee of the fireproof flooring, steel star stanchions, Acme steel decking, and other inventions of an engineering and mechanical nature, which form the specialities of this firm. The two first mentioned are of the most import to the building profession. Mr. Lindsay's tubular fireproof floor is made, as most of our readers are aware, of hollow rectangular bricks, made of fireclay, and fitting between rolled joists. The bricks key one into the other, to make a rigid block, and have dove-tailed grooves top and bottom to bind to the concrete and plaster. They are very light, and can therefore be laid very quickly. There is also provision for entirely incasing the joists and girders, thus forming one of the lightest and safest floors which can be constructed at a moderate cost. A special feature is the use of these bricks for building partitions, as, on account of the hollow spaces in the bricks, the wall are rendered both fire and sound proof. The new steel star stanchions are a great advance on the old-fashioned columns, saving one-half to two-thirds of the weight and space, and are infinitely superior in appearance. They can be used in continuous lengths from top to bottom of a high warehouse. Although space does not permit of a detail list of Messrs. W. Lindsay and Co.'s present contracts, we may state they are supplying the floors and ironwork at the London Hospital (new addition). They are also erecting large granaries at Bristol, with floors exceeding an acre in extent, and are providing their stanchions throughout.

Mr. William Letheren, founder of the present firm of W. Letheren and Sons, Art Metal Workers, Vulcan Iron Works, Cheltenham, whose portrait is placed at the lower left-hand corner of our plate, was born in 1833. In the year 1868 he competed for the Society of Art Prizes, and was successful in obtaining the highest possible award for a wrought-iron panel for a screen, which was afterwards purchased by the Committee of Council on Education, and placed in the South Kensington Museum. He was among the first to introduce the manufacture of that delicate and highly artistic wrought-iron work, which possessed as its special feature the faithful representation of real natural flowers and foliage, and which, for interior decoration, was exceedingly well adapted, and lent itself successfully as an embellishment to all kinds of objects—such as candle, gas, and electric fittings. Numerous exam his own handiwork in this art of delicate fo and leaf-beating are to be found in various of the country, although not always accessi the general public. By keeping pace wit times, adapting himself, and regulating a staff of skilled workmen to meet the vari ever changeful demands of public tast fashion, he gained a considerable reputati his art; and there are at the present time a number of men in various localities— especially in London—who owe their succe great degree to the instruction derived fr tuition and guidance. It would be impossi give anything approaching a complete list public and private work carried out by M Letheren; but we will mention a few example the elaborate wrought-iron balustrade for the grand staircase at Meaford Hall, Sta shire, and also the coil case panels in the O room for the Right Hon. Lady Foreste hammered iron and brass screens and ga dants at Christ Church and All Saints' C Cheltenham; all the electric pendant brackets of delicate forged work, an wrought-iron gates, Beckford Hall, near Te bury; the entrance gates and railin Abberley Hall and also of Overbury Cour coronas and brackets, and entrance ga Hastings Municipal Buildings and New the massive wrought-iron tomb railing rounding the monument of the late Ra Kolaphur, made for the Government of Bo restoration of the old entrance gates and f at the Guildhall, Worcester. About three ago Mr. Letheren admitted his two son partnership with him, and an extension business was rendered necessary by the inc demand for all classes of work, especially hammered iron electric fittings and other specialities. A large amount of work of description is being executed at the Chelt manufactory at the present time, one imp commission being the elaborate wroug gates to be fixed at Goodrich Court, He shire, the residence of Mr. Moffatt. Thes are nearing completion, and measure 25f by 16ft. wide, and are composed of worked scrolls, beaten leaves, and sus festoons of fruit and flowers; the gate illustrated in the BUILDING NEWS a sho ago. Mr. William Letheren is a member Society of Arts and an Associate of the of Architects.

Mr. S. King-Church, the fifth on t sheet, the managing director of the Staffordshire Blue Brick Company, L and owner of the freehold estate on that Company's celebrated "Cakemore Brick Works are situated, comes lineage which (under the old family n "King," the addition of "Church" name having been made some years ago nection with a property left to his father condition) has been better known military than the mercantile world, his two brothers having both been distin generals in the English army, while he was born in—and dates his earliest recol from — the Tower of London, whe father then held an important post Ordnance Office. He was educated at th giate School at Southwell. His ma experience, has, however, been more th merchant than of a manufacturer, and been as the head and the moving s this undertaking that he has broug business to its present magnitude and The manufacture is a peculiar one, almost unique in the engineering and world; and, under the able and active m ment of Mr. King-Church, has attain dimensions that already upwards of 80,00 bricks, pavings, copings, and other simil have been sent out from the works to all the world; and, with the additions already extensive works now going made, they will be brought up to the e capacity of 100,000 bricks per worki The blue marls and clays which Mr. Church has fortunately proved to exist tically inexhaustible quantities on the es he purchased in 1884, then intending to as a colliery, are of peculiarly excellent and form the sole ingredients (nothing el mixed with them) for the manufacture have now become celebrated under the tion of "South Staffordshire blue

cks," and which are now very generally cified by the engineers under that heading in important contracts. They are indeed now tensively used all over the world for railway l canal platforms, tunnels, bridges, copings, rbings, stable-pavings, and for sewer works; also for the foundations, buttresses, and other portant portions of all buildings in which the mense resisting strength that these manufac- es give are required, which great strength, nbined with their being impervious to damp l to acids, imperishable and indestructible, nstitute their great value, and there is no doubt t their use is daily becoming more and more neral. Mr. King-Church, who has already ne so much to spread the use of this material, quite lately designed a new use for it in con- tion with the laying of the wires for electric hting and other purposes, which, now that the tem of overhead wires is doomed, becomes a st important question. It is in connection h this that Mr. King-Church has just taken a patent for constructing in this material nich he claims will never rust or wear out) a verly-designed cavity which can be so placed ler the street-kerbings as to contain the wires v being so generally laid under the streets in our great towns, in such manner that the es can be got at from time to time for addi- ns or repairs thereto, without that constant turbance either of the roadway or pavement ich is now so injuriously affecting the carriage l cart traffic, as well as the comfort of foot- sengers.

Mr. Roger L. Lowe, whose portrait is last on our sheet, commenced business as retary and general manager of a large mical works, and the chemical knowledge n acquired served him in good stead in after . He began his speciality business in cement crete, granite face and fireproof floor con- uction, British and foreign asphalte, and od-block flooring sixteen years ago at Farn- rth, Bolton. Since then he has had large nent concrete contracts, in the erection of ton-spinning mills, warehouses, railway ions, hotels, markets, town-halls, and many blic buildings. Amongst others, the Birken- d Town Hall, Exchange Railway Station and tel, Liverpool; the Crewe Cattle Market, rkhouse at Burton-on-Trent, Belper Hos- l, the Nicholson Institute, Leek; the Rain- and Lancaster Asylums, and Liverpool Cor- ation Artisans' Dwellings. In asphalte, Mr. ve has rendered watertight large underground rvoirs in the red sandstone for the St. Helen's poration; many mill roofs, &c.; also laid carriage-ways and footpaths for some miles promenade extensions at Southport and er places; also rendered watertight rail- arches, bridges, &c., for miles of new ways for the London and North-Wes- n Railway Company, the Midland Railway mpany, the Lancashire and Yorkshire lway Company, &c. It was chiefly through knowledge he acquired when engaged the chemical trade, that Mr. Lowe was bled to bring out his patent for securely ening his patent wood-block flooring. This ness has been an unqualified success, and nlarging every year. The patent flooring been laid in 171 churches and chapels, 117 ges and schools, 109 warehouses, &c., 67 n halls and libraries, 48 hotels, &c., 34 hos- ls and infirmaries, 25 banks, &c., and 14 of Majesty's new Post-offices. Amongst other es the patent flooring has been laid at the ichester Jubilee Exhibition, the new Scotland- l Police Offices, London; the Liverpool Corn hange, the Sunlight Soap Works, the Ex- nge Station, Liverpool; the Mersey Tunnel way Booking Halls, Liverpool; Bream's- ildings, Chancery-lane, London, &c.

BOOKS RECEIVED.

ie Centrolinead Applied to Perspective Draw- by E. MacDougall (London: Lawrence rt and Co., 149, Queen Victoria-street).— is a very serviceable little book for the ent of perspective who requires to use the rolinead. Hitherto that very useful appliance been a "sealed book" to many, and some le-of-thumb" method has been resorted to. arm of the instrument is often set to a rent angle to the other arm relatively to the . Mr. Macdougall explains the theory of nstrument, which is founded on Euclid III. 31, and gives some very easy directions for setting it to two given converging lines, after which he gives examples of its application to various stages of perspective drawing. No intelligent draughtsman can fail to understand the manipulation of the instrument after perusing this little book, and we therefore recommend it. The diagrams are clear.——*Electric Light Fitting*, by John W. Urquhart, Electrician, with illustrations (London: Crosby Lockwood and Son), is a handbook for working electricians and engineers. Mr. Urquhart has endeavoured to divest his work of mathematical symbols, and has consulted only the requirements of working engineers. The author's work is chiefly devoted to an explanation and discussion of the branches of fitting and "wiring." The author assumes preliminary and elementary knowledge on the part of his readers, and goes at once into facts and methods. Central station work, giving notes on management of dynamos, and suggestions; the faults due to defective insulation or conduction, tests for leakage, repairs to the armature, hints about accumulators; the switch-board, running "in series" or "shunt dynamos in parallel," are considered. Arc lamps in "parallel," trimming; arc lighting circuits, running "leads"; wiring for incandescent lamps, according to the "parallel" and "series" multiple, three-wire and multiple series systems —are clearly explained and illustrated, and some useful remarks are furnished on the wiring of buildings. The work is essentially practical. ——*The Electrical Engineer's Pocket-book*, by H. R. Kempe, M.Inst.C.E., &c. (Crosby Lockwood and Son), is a valuable compendium of formulæ, tables, data, and rules required by the practical electrician. The work is in a convenient form for the pocket, and is concise, well printed, and illustrated. No electrical engineer should be without a copy.——*Transactions of the National Association for the Advancement of Art*, held at Edinburgh, 1889, (London: 22, Albemarle-street), is a bulky volume of nearly 500 pages, containing the presidential addresses and papers delivered and read at last year's Art Congress. The work is well printed. The excellent sermon by the Rev. Robert Flint, D.D., on the "Good and Perfect Gift of Art," is given. The presidential address of the Marquis of Lorne introduces the reader to the different sections presided over by various eminent masters of their respective arts. The section of Painting includes the papers read by Briton Riviere, R.A., G. F. Watts, R.A., J. E. Hodgson, R.A., John C. Horsley, R.A., William Hole, R.S.A., W. F. Yeames, W. D. M'Kay, R.S.A., W. B. Richmond, A.R.A., and J. Lawton Wingate, R.H.A., on various subjects relating to the art. "The Failure of Results of the Government Art Schools," by J. E. Hodgson; "The Methods on Oil Painting"; and "French Impressionism," are the most interesting of them. The section on Architecture contains the address by Dr. Rowand Anderson, president, also papers by David MacGibbon on "Scottish National Architecture," and one or two other interesting papers on mouldings and architectural education. The section of Applied Art, presided over by William Morris, includes his address and some papers by Walter Crane, J. Starkie Gardner, Thos. Bonnar, and Dr. Haycroft. The combined meetings contain one or two able papers on the Value and Function of Texture in Art, by Geo. Simonds, and as a Quality of Art and Condition for Architecture by Edward S. Prior. Finish in Art, by A. Roche; Municipal Legislation with reference to Architecture, by Sir James Gowans; Influence of Public Authority on Street Architecture, by Thos. Blashill; Some Sources of Expression in Architecture, by J. D. Sedding; and Practical Artistic Co-operation, by John Honeyman are other valuable papers printed, reports of which have appeared in this journal. ——Parts 19 and 20 of *Ipswich, Past and Present* (Ipswich: W. Vick) contain half a dozen mounted platinotypes, including two views of Archdeacon Pykenham's Gateway, an interesting specimen of crow-stepped brickwork, and of half-timbering, built in 1460; a 17th-century chimneypiece in the "Half Moon," of wainscot, carved with two relief arabesques; the Council Chamber in the Town Hall, designed by Messrs. Bellamy and Hardy, of Lincoln, in the Venetio-Gothic style of 1865; and rococo plaster ornamentation in the Working Men's College.——*A Treatise on Masonry Construction*, by Ira A. Baker, C.E., Professor of Civil Engineering, University of Illinois. Third edition (London: Kegan Paul, Trübner & Co., Limited). In this treatise Professor Baker has reprinted in a wide and extended form the manuscript textbook he has prepared for his own class at the University. The principles of masonry in its scientific aspect are considered pretty fully. Tests of building stones, classification of stones, bricks, their manufacture and requisites, crushing strength, size, weight, and cost, are dealt with in a methodical manner, and in the order the architect is required to use such materials. Lime and cement are fully treated, on which the author refers to recent experiments, Mr. Faija's work, the tests recommended by the American Society of Civil Engineers, and other information. Part II. deals with methods of preparing and using materials, in which we find many practical remarks. The data for estimates are particularly useful, and are given under a distinct heading under each material. We see also clauses for specifications. Stone-cutting has been handled in an elemenary manner; the tools used, methods of forming and finishing surfaces, kinds of walling, ashlar work, specification for ashlar and rubble, measurement, and estimating being points dealt with. Brick masonry in its practical aspect follows, the author giving some useful specification clauses for sewers, arches, and other work. Part III. treats on foundations of various kinds, in which the crib and open caisson, the pneumatic, freezing, and other methods are described. Under masonry structures, dams, retaining walls, bridge-piers and abutments, culverts, and arches are discussed. The theories of the arch are well described and illustrated by diagrams, and various rules are given for apportioning the thickness of arch, abutments, &c. Details of backing, spandrel filling, drainage, and centring are comprised. As an elementary compendium of data and results for the architectural and engineering student, Professor Baker's volume will be found very concise and complete, though it does not enter into architectural details of masonry, nor into problems like groined arches, and arches on the curve. The classification of matter and the sub-headings or sections are valuable features of the book, and facilitate reference.——*Ye Olde Corner Postes of Ipswiche.*—Few towns are so rich in examples of Mediæval wood carving as applied to domestic buildings as is Ipswich, and Mr. J. Shewell Corder, a local architect, has rendering good service in sketching more than a dozen choice specimens of the quaint corner posts still to be found at the junctions of the streets before they were swept away by the refrontages and rebuildings inevitable in a thriving commercial centre and port. The sketches are freely and boldly drawn, and evince sound technical knowledge, and facility in catching the salient points of a carving. With a well-written preliminary chapter on the Ipswich dwellings of the 14th and 15th century, and a brief description of each example, they make up into a folio volume, being published by subscription. The examples are widely diversified in character, but are nearly all of the Early Tudor period. One at the corner of Oak-lane and Northgate-street, formerly an inn, and now an architect's residence, has on the elaborately-carved bracket the representation of a blacksmith making a horseshoe on his anvil; another in Foundation-street shows Reynard in monk's cowl preaching to a flock of geese; and a third removed from Brown's-yard to the collection in London, depicts Queen Elizabeth and Mars, the latter incased in plate armour.

The 45th annual meeting of the Cambrian Archæological Association was held on Wednesday at Holywell, under the presidency of Lord Mostyn. There was a large attendance of archæologists from various parts of England and Wales. Excursions were made to St. Winefred's Well, Basingwerk Abbey, and Gop, a tumulus where Queen Boadicea is supposed to have been buried.

Plans are in the course of preparation for a new church to accommodate 380 people, for the parish of St. Andrew, New Clee. The church, which will be built of red bricks and Ancaster stone, will contain nave, chancel, organ-chamber, and western vestries for clergy and choir. The east end, facing Albion-street, will be the principal elevation, embracing the large porch entrance, chancel end with traceried windows, and the tower and spire. Mr. E. W. Farebrother, F.R.I.B.A., of Grimsby, is the architect.

The ratepayers of Ramsgate have decided by a large majority in favour of the construction of a new marine drive at a cost of £40,000.

CONTEMPORARY ART WORKERS AND MANUFACTURERS.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES, 1890.—A PRIVATE ART GALLERY AT PENARTH, CARDIFF.—THE VICTORIA HOSPITAL, FOLKESTONE.—TWO NEW RESIDENCES AT CARLISLE.—ADDITIONS TO THE DOLPHIN HOTEL, HERNE BAY.

Our Illustrations.

CONTEMPORARY ART WORKERS AND MANUFACTURERS.

(See description on p. 248.)

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

These drawings, by Messrs. T. McLaren and M. B. Adams, illustrate the A.A. visit to Oxfordshire of last week, described on p. 242.

A PRIVATE ART GALLERY AT PENARTH, NEAR CARDIFF.

The "Turner House" was erected a year or two ago at Penarth, near Cardiff, by Major J. Pyke Thompson, J.P. It is a *bijou* art gallery which contains a number of very choice and interesting works by the older English water colourists, a unique collection of the etchings of Meryon, several excellent examples of Dutch and English masters in *genre*, and some well-selected and costly specimens of Chelsea, Worcester, Swansea, and other rare porcelains. The title of the "Turner House" has been given by Major Thompson rather in honour of the name of Turner, as one of the greatest associated with art, than as indicating any special connection between it and the works exhibited. Nevertheless, a magnificent drawing by Turner holds a central place in the gallery with smaller works by him, and also a complete series of the "Ports and Harbours," and typical examples in various states of the *Liber Studiorum*. Setting aside a portion of the grounds attached to his residence, Major Thompson obtained sketches for a small art gallery from Mr. Edwin Seward, F.R.I.B.A., and from these designs the building was carried out by the architects, Messrs. Seward and Thomas, and the gallery during every week since its completion by the contractor, Mr. Burton, of Cardiff, has been thrown open for the use and enjoyment of the public on Sunday afternoons and on Wednesday afternoons. The building is erected in red brick, the carving, &c., being executed in red Shawk stone, and the frieze, which typifies art and literature, in *sgraffito*. The interior contains: On the ground floor, an entrance hall and staircase, with studio attached, and adjoining rooms for a caretaker, with back entrance from the grounds of Major Thompson's residence. On the first floor, the large gallery, with a platform recess and a small dressing room. These features have been made available on one or two rare and pleasant occasions when the owner has invited the South Wales Art Society and the Cardiff Literary Society, &c., to hold their reunions in the building. The rooms are decorated very plainly in white and gold, with effective brown paper backgrounds for the picture hanging, above which is a deep gold frieze of Tynecastle tapestry. The collection of art works is slightly varied from time to time, a recent change of a few weeks ago placing on view, among others, some exquisite architectural drawings by S. Prout, Nash, and Cotman.

THE VICTORIA HOSPITAL, FOLKESTONE.

This building, formally opened on July 3rd last, has been erected as a memorial of the Queen's Jubilee, to replace the present unsuitable building and to meet a much-felt want. The cost was to a large extent raised during the Jubilee year. The site, consisting of 1½ acre, was purchased at a cost of £1,500, is well situated, having open spaces and a good outlook on every side. The committee requested designs from four local architects for a building suitable for 35 beds, with large administrative offices, and an out-patient and dispensary department. They consulted Prof. Roger Smith, who advised them to adopt the design of Mr. Joseph Gardner, of Folkestone, who has carried out the present building. The designs included two wings, which the funds would not allow to be carried out at once, but which can be added in the future. There was an alternative design sent in with circular wards, which may be adopted if preferred. The present building, which is the centre portion of either design, is adapted for 20 beds, with 1,600 cubic feet space to each, and has cost about £8,000, is faced with red bricks and Westwood Ground stone, and has Homan and Rodgers' fireproof floors and wood blocks. The builder is Mr. W. Brooks, of Folkestone.

CHATSWORTH SQUARE, CARLISLE.

The accompanying illustration represents two new residences that have recently been completed on the Duke of Devonshire's estate on a site at the east end of Chatsworth-square. The elevations are built with red bricks from Mr. J. C. Edwards's Ruabon Works, and local white stone, the roofs being covered with green slates. The interiors are well finished with pitch-pine staircases, and all other joiner's work of yellow pine, painted in various colours and varnished. The plasterer's work throughout has been executed with Robinson's cement, which has allowed the walls and ceilings to be painted, papered, and decorated before the houses were occupied. The drains have been carefully laid with Adams's automatic flushing tanks, in brick chambers at the head. The work has been carried out by Mr. T. Taylor Scott, architect, Carlisle, for Mr. J. B. Scott, of the firm of Messrs. B. Scott and Sons, and Mrs. Hardy, of the same city. The following local contractors have been engaged—viz.:—Builder's work, Mr. Jas. Metcalfe; joiner's work, Mr. Jos. Forster and Mr. Wm. Batey; slater's work, Mr. C. J. Nanson; plasterer's and concrete work, Messrs. R. M. Ormerod and Son; plumber's, painter's, and glazier's work, Messrs. W. and R. M. Hill.

The town council of Glasgow recently decided to purchase St. Andrew's Halls at an outside cost of £2,500. The committee which is carrying out the work has reported that so many unforeseen things have had to be done in the way of alterations and decorations that already £4,115 has been expended. They now sought authority to employ Mr. William Leiper, architect, of Glasgow, at a fee of from 75 to 100 guineas, with a view to seeing that the repainting of the halls should be executed in a harmonious manner. The required permission was given after some discussion.

The old Potteries Railway, which was intended to connect the Cambrian Railway and Shrewsbury with the Potteries, but was never completed beyond Shrewsbury, will be opened soon after having been closed for several years. The work of reconstruction has been intrusted to Mr. Charles Chambers, Westminster, and the line has been handed over to him this week by the new company. It is proposed to extend the line to Market Drayton. The old portion, that between Shrewsbury and Llanymynech, is expected to be finished in twelve months.

The memorial stone of a technical school at Coatbridge, which is being erected by the Old Monkland School Board, with the aid of the first building grant to Scotland from the Science and Art Department, is to be laid with masonic honours by Sir Archibald C. Campbell, of Blythswood, Grand Master Mason of Scotland, early in October.

The Corporation of Manchester have accepted from Mr. R. R. Ross the gift of fifty-four water-colour drawings by deceased artists of the British school, collected at a cost of £3,500; the only conditions being that they are hung together in one of the galleries of the Royal Institution in that city and that they are exhibited free of charge.

COMPETITIONS.

Birmingham.—At the last meeting of the School Board, the Chairman announced that Mr. Henman, the assessor appointed by the Board, had given his awards to the plans submitted for the Greet school, in the following order: First to the one sent in under the name of "Light," second to "Sidelight," and third to "Practical." It was resolved that the first set of plans be accepted, and also that £15 and £10 be given to the authors of the second and third sets respectively. On the envelopes containing the names of the competitors being opened, it was found that Mr. A. Harrison, Colmore-row, was the successful architect. Messrs. Essex and Nichol sent in the second set, and Messrs. Cossins and Peacock the third.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

The Nottingham Architectural Society.—A most instructive and interesting excursion was made on Monday to Edinburgh and the Forth Bridge by the members of the above society, together with a few visitors. Arriving at Edinboro' about half-past eight, breakfast was partaken of at the Edinbro' Hotel, after which the party drove to the Forth Bridge, by way of the magnificent park of Dalmeny, on the banks of the Forth, a privilege graciously accorded to the society by the Earl of Rosebery. Arriving at Queensferry, the courteous resident engineer, Mr. Adam Hunter, accompanied the party across the bridge, pointing out the many interesting characteristics of the structure. Much amazement was expressed at the magnitude and boldness of the undertaking, to appreciate which thoroughly it is necessary to walk across the bridge as well as to view it from the river. Returning across the Forth by a steamer, the enormous spans were seen to advantage. After spending several hours at the bridge, the party returned to Edinboro' to lunch; after which, the various places of interest in the city were visited—such as Holyrood, Carlton Hill, Castle, the Exhibition, &c. The party dined at eight, and left Edinboro' at eleven, reaching Nottingham on Tuesday morning, after having spent one of the most enjoyable of the many interesting excursions this society has made.

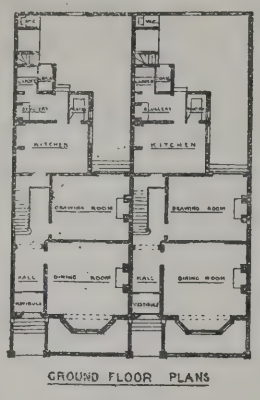
CHIPS.

Memorial bricks of a new Wesleyan chapel were laid at Burton Latimer last week. It will be seated for 200 persons, and Mr. G. Coltman, of Kettering, is the builder.

An interesting discovery has been made at Verona, near the Cathedral. Some workmen were excavating a part of the Piazza of the Duomo for the repairs of a drain, when they came upon a gigantic statue of Minerva in white marble, in a perfect state of preservation.

The memorial stones of a new Sunday School in connection with the Primitive Methodist Chapel at Oswestry were laid last week. The building, which will have a frontage to Castle-street, will be in the Gothic style, of simple character, and will be built of red pressed bricks, with Grinshill stone dressings. The interior is 63ft. long, 42ft. wide, and 23ft. high, and contains a lecture-room 24ft. by 18ft., two infants' classrooms, and eighteen classrooms. The plans were prepared by Mr. E. Bremner Smith, of Oswestry, under whose superintendence Mr. W. H. Thomas, of Oswestry, is carrying out the work, at a cost of £1,000.

A beginning has been made with the scheme for filling the external niches of the National Portrait Gallery at Edinburgh with statuary. Two Edinburgh citizens have contributed figures of King Malcolm Canmore and his Queen, modelled respectively by Mr. John Rhind and Mr. Birnie Rhind. The figures are each 6ft. 6in. in height.



A special committee of the Cardiff town council has been appointed to consider and report on the desirability of providing a new town hall, comprising courts of justice and municipal offices, on the present or some other site, and of alternative schemes for the utilisation of the whole or in part of the present buildings and site.

The Wednesbury town council have increased the salary of the borough engineer to £450 per annum, allowing him at the same time £100 to cover out of pocket expenses in relation to sewerage matters.

Additions at St. John's Schools, Crossens, of a new infants' school with club-room over is about to be commenced from plans prepared by Mr. Goodwin S. Packer, architect, of Southport.

GROUND FLOOR PLANS

Scale of 10 0 10 20 30 40 50 Feet

RETAINING-WALL THICKNESSES.

A GENERAL rule, sanctioned by several engineers of repute, is to make the thickness of a wall to sustain earth level with the top, one-third of the height from the top of footings. Benjamin Baker, whose experience in the construction of underground railways entitles him to speak, shows that a wall whose thickness is one-fourth of its height, and which batters 1in. or 2in. per foot on the face, has sufficient stability when the backing and foundations are moderately durable. This thickness allows a factor of safety of 2 or thereabouts. For a vertical brick wall, Gen. Fanshawe recommended 32 per cent. of the height for the thickness, 24 per cent. of height for a batter of one-fifth, 25 per cent. of height for batter of one-sixth, 26 per cent. for a batter of one-eighth, 27 per cent. for a batter of one-tenth, 30 per cent. for a batter of 1-24th. These thicknesses are given for earth of ordinary kind. For vertical walls sustaining sand, gravel, or earth when backing is loosely deposited, the thickness should be from 35 to 40 per cent., this being given at the top of footing course; the lesser thickness being for cut stone or coursed rubble, and the greater for brick or common rubble.

LIGHTNING RODS.

THE protection of buildings from lightning is becoming a very necessary precaution in the United States. The larger and lofty hotels are exposed to the electric discharges, which are very great and terrific. Thus we hear of one new hotel at Cliffs Point, on Lake Champlain, having been exposed to a very severe storm, but which passed through it without damage. The lightning rods put up by a New York firm, Messrs. J. D. West and Co., were connected to every part of the structure, and put into communication with every metallic object. The rods are ½in. square, of yellow copper, they extend along the ridges of the roofs, and have points on all pinnacles and gables, and run down corners and into the earth 10ft., and connect with water and sewer pipes. The building is a long parallelogram, having towers at the centre and at each end. As all parts of the structure are placed in metallic contact, and are thus protected.

ZINC ON BRICKWORK.

It is said that sheet zinc, when in direct contact with brickwork, suffers from rapid corrosion. The fact has been noticed in connection with the Dublin City Market halls, where sheet zinc rested on brick walls. At the contact of the two materials the zinc was deeply pitted. The bricks were found to contain 1·14 per cent. of soluble salts, which increased the effects of moisture. The result noticed ought to be a lesson to architects and builders in laying zinc never to place it in contact with brick or stone, especially when subjected to moisture. The zinc gutters should be laid on boarding, either felted or plain. Where brick parapets occur, the sheet should be turned up, but not to touch the surface of the brickwork, and the edge inserted in a groove covered by a cement flushing. In some cases the flashing can be fixed free of the brickwork on wooden grounds, and the zinc simply made to cover it. Direct contact with the masonry is best avoided.

The Bristol Borough Asylum at Stapleton is being enlarged at a cost of about £90,000, from designs by Messrs. Crisp and Oakley, of that city. The new wards will provide accommodation for about a thousand patients, and additional accommodation for the administrative department, a general dining-hall, new workshops, and laundry are also included in the scheme. Mr. Beaven, of Bristol, is the contractor. The works were inspected by the members of the city council on Wednesday week.

Mr. John Grundy, of 30, Duncan-terrace, City-road, London, N., has just received orders for supplying his Patent Warm-Air Ventilating Smoke-consuming Firegrates to the National Health Society, Berners-street, W.; the Board Schools, Holbroke; the Board Schools, Cobholm Island; Hatchford Nurseries; the Maidstone Institute; Lunatic Asylum, Cork; the New Schools, Blake; the Congregational Schools, Chingford; Hayward's Heath Board School; the Brighton Road Schools; the New Schools, Aldershot; the Grammarian Schools, Atherton; the Parish Rooms, Lytham-le-Sands; the Bromley Park Estate; Bromley House, Broadstairs, &c., &c.

ADDITIONS TO THE DOLPHIN HOTEL, HERNE BAY.

THE above extensive additions comprise large smoking-room, with lavatory and w.c. accommodation, eight new bedrooms, bath-room, ladies' lavatory, &c. The elevations are of selected yellow stocks, all dressings being of patent red stone. The roof is covered with red plain tiles, the lower windows, doors, and fittings are all of teak, French polished. The whole of the works have been carried out by Mr. Lawrance Seager, builder, of Sittingbourne, at a cost of £1,260, from the designs and under the superintendence of Mr. G. E. Bond, M.S.A., of Rochester.

WAYSIDE NOTES.

members of the Architectural Associa- who accompanied the excursion to ave failed to have a good time, it will because of any lack of things worth et alone sketching and measuring. by the illustrations that have been l in connection with the annual outing, ict selected this year has proved ex- ly attractive to the excursionists' pencils. ne members of the A.A. have been in etching condition, or more time has been for the work than on some of the excur- ere ground has been covered at the of quiet wayside studies.

ciety of Architects contemplates keeping modest distance of town, and it will not that account, nor will it find the places ny less beautiful and interesting they are so near. Merely to pass the pleasant Kentish countryside at when cornfields are golden-brown and lens are ready for the pickers, will elight to the lover of nature, and architects are lovers of nature. r, Maidstone, and Canterbury, more- places that, for the interest afforded d architectural character, hold their own, ize, against any old English town. All spects of a renown that is almost classical, ve quiet, retired, out-of-the-way nooks, ny a modest old architectural relic. the massive keep at Rochester, rising nd upright in strong contrast to the l lines of the flowing Medway. There ll Harry Tower at Canterbury, seen in rspective under the walls of nave and ; and there is the old parish church at ne, forming with the venerable buildings with it, and the barge-laden river, a ue composition indeed. Three well- iews are these, yet ever charming how- requently we may behold them—three groups of old buildings that occur to one decting upon the architectural remains of Kentish towns, and not three isolated s of beautiful grouping; but three leaders of a host of others scarcely less remarkable. o, the excursionists will find the places ited round Tunbridge to be of passing Tiny Bidborough Church, glorious st, and historical Hever, will enchant ho may have been unacquainted with ore the excursion; and the like of Chid- e village I have never seen. Knowle tham are also to be included in the tour, ncludes at Dover at the end of the present nd which, having been so well planned, ut prove a great success. The routes being so near at hand, there should be ous meet at the west door of Rochester l on August 25th, the opening day of the l excursion.

as everyone is taking, or thinking of their yearly period of recreation, there burst of competition advertisements. four announcements last week, your devoted to the advertising of competi- k unusually busy for the time of year. nnouncements made, however, one relates the extension of time in the Swansea Board competition—an announcement ll annoy good men and true, and he pet vices of the indolent and pro- ting; but concerning the extension of competitions I have already written and, I much fear, wholly in vain. Of nicipal lodging-house I have before and have only to add that the general among architects seems to be that fair- squareness will be the characteristics of petition. In their advertisement for ath designs, the Coventry Town Council xhibited liberality in the giving of -money, £100 and £50 in a £15,000 g certainly generous. I have seen the rs and instructions, but they are not of lly generous order; in fact, they are bly limited and meagre. The Oldham Board mean to make something towards s. of their competition, even if only two- per applicant for particulars. They are be blamed: the half-a-crown, little as vill prevent applications out of mere

pose we must expect another highly- ed competition, if the people of Morley have decided to have a new town-hall. This is the sort of competition that drags every whole- sale competitor from his lair. Everyone has a go at the town-hall. It is rather surprising, after the experiences which the profession have lately had, that it is not a bit tired of competing in its two hundreds. As it is, with three premiums of 100, 50, and 25 guineas, as proposed by the Town-hall Committee of the Morley Town Council, we may be sure that we shall have another rush of mature competitors and youthful premium hunters.

It is proposed, I see, by the ten councillors of Morley, that it be a condition of their competition, if held, that each competitor shall, if required, produce a *bonâ fide* tender from an approved contractor to carry out the work for the amount specified in the estimate to accompany each design. This will give some additional trouble, and won't be at all a welcome innovation to a class of competitors about whom the less said the better. It would be a point to the advantage of local men, and very inconvenient to those at a distance. All the same, it is certainly calculated to check reckless and unfair competing. It is not a new plan, but one seldom adopted. If more generally used in the future, and found distasteful to competitors, they would only have themselves to blame, or rather their unscrupulous fellows who will do anything to gain a competition, and look upon the overrunning of stipulated cost as rather a joke than otherwise. Inasmuch, however, as the assessor is supposed to be a perfect check against swindlers of this order, the honest competitor need not fear that he will ever have to suffer for the misdeeds of others and be put to the additional labour and expense of giving *bonâ-fide* tenders with his designs. Now and then, as will possibly happen in the proposed Morley competition, the system may be adopted, and in very small, local competitions it is often desirable to get, by compulsion, tenders from contractors; but these are only exceptional occurrences, and need but be regarded by the competitor as relieving the monotony of ordinary competitions.

I was under the impression that something had long ago been done to mitigate the nuisance caused by the pollution of the Thames by the drainage of house-boats. Attention was drawn to the subject a year or more ago, and I well remember commenting upon it at the time. From a question asked of the President of the Board of Trade in Parliament, a day or two before the close of the Session, it is to be gathered that the nuisance has continued unabated. It appears that, in his evidence before the committee now inquiring into the water supply of London, Sir Robert Rawlinson had touched on the question of the pollution of the Thames by house-boat drainage. Considering the number of small floating houses that appear on the Thames in Henley days, one would have thought that the Thames Conservancy Board would have taken some measures to prevent the wholesale pollution that yearly takes place in the upper reaches of our pleasant metropolitan waterway. Something *may* now be done, as Sir Michael Hicks-Beach has promised to communicate with the Thames Conservancy Board on the subject. It is greatly to be hoped that stringent measures will be taken, as, besides the pollution of a source of London water-supply, it is an injustice to riparian owners and to individuals—at this time of the year in their thousands—who seek health and pleasure in holidays spent on the bosom of old Father Thames. House-boat owners may find their customs and arrangements very convenient and comfortable; but, if need be, they must be a little incommoded for the weal of the community.

If Mr. Robert Boyle, or someone equally enterprising, would make a "Sanitary Crusade" round England, or even London, we might practically benefit. Matters of drainage, &c., appear rather frequently among the minor news of the week. There is diphtheria in Paddington, owing to polluted drinking water; scarlet fever in a Yorkshire village, owing to the bad state of the village pond; hundreds of fish have lately been poisoned in the River Soar, Leicestershire, owing to the amount of filth conveyed into the stream by sewage, towns and villages discharging their sewage into the river between Leicester and Loughborough, a distance of twelve miles; and a correspondent writes to Saturday's *Times*:—"At Ware Lock the treated sewage of Hertford slowly flows into the Lea through an open cutting about two miles in length. The stench arising from this affluent is most offensive, and the surface of the—" &c., &c.; for I can't go into these nauseating details and put them before such readers as are left at work, and feel, doubtless, that they ought to be away breathing sea breezes or moorland ozone instead of reading about disorganised drainage arrangements. Suffice it if I point out that at Ware *treated* effluent comes into the Lea, and remark that it won't do, if processes which are theoretically supposed to turn out a perfectly inoffensive liquor prove in practice to be as the *Times* correspondent describes at Ware; for I presume that at Hertford they employ the modern precipitating and settling method of treatment.

The Lea is a source of London drinking-water supply, like the Thames. And, like the Thames, it should be guarded against pollution. If, as there appears some probability, the Metropolitan water supplies are at some future date to be taken over by the municipality, it is only reasonable to hope that fresh sources of supply will be sought, and the Lea and Thames, the absolute purification of which is well-nigh impossible, abandoned as founts for the Londoner's drinking water. Other great cities in England and Scotland have pushed out aquaducts far away from their own districts, and obtained a pure crystal stream. Sooner or later London must do the same.

GOTH.

CHIPS.

The restoration and re-roofing of All Hallows Church, Rochester, has just been completed. Messrs. J. G. Naylar and Son, of that city, were the contractors.

The memorial stones of a new church in course of erection at Penygroes, Brynkir, were placed on Saturday by Lady Puleston. Mr. H. Kennedy, of Bangor, is the architect, and Mr. R. R. Williams, of Carnarvon, the contractor. Mr. Assheton Smith has given the slates for the building, and the tile work has been executed by the Ogwen Tile Company, Bethesda.

The High Level Railway, at Halifax, will be opened for passenger traffic on Wednesday, the 3rd prox. The line is three miles in length, and the terminus is 300ft. above the level of existing stations. Messrs. John Fraser and Sons, of Leeds, and Mr. Samuel Utley, of Halifax, are the joint engineers, and Messrs. Charles Baker and Sons, of Chesterfield, are the contractors.

At St. Michael's Church, Spurriergate, York, a new organ has been built by Messrs. W. Denman and Son, of Skeldergate, York, and was opened on Sunday. The case is of varnished pitch-pine, the interior woodwork being of polished oak, and the pipes are of spotted metal.

A stained-glass memorial window, placed in the south side of Hanbury Church, near Stafford, was unveiled on Thursday in last week. The subject is St. Mary, wife of Cleophas, represented as clinging to the cross, and the architects are Messrs. Ward and Hughes, of London.

The local board of Torquay have appointed, from among 109 candidates, Mr. Garrett, late assistant-surveyor at Bournemouth, as surveyor, in the stead of Mr. Joseph Hall, C.E., resigned, now borough surveyor of Cheltenham. At the Torquay Town Hall on Friday, Mr. Hall was presented with a handsome and valuable inkstand, composed of local marbles, by the employés of the Torquay Local Board, as a token of their respect and esteem.

An improvement in the Wyle Cop, at Shrewsbury, has been made by the restoration of the Old Unicorn Inn. This framed building, which for many years presented a dilapidated appearance, is now faced with black and white half-timberwork, and the whole has been put in thorough repair and extended. It was anticipated that good timberwork would be found under the plastering; but with the exception of oak tracer-windows, the framing was of too rough a nature to be exposed. The half-timberwork is thus a sham formed with boards, and made to correspond with the genuine work in the old gables. The shops under the building have been glazed with plate-glass, and all the other windows filled with mullioned bays, and glazed with leaded glass. A building at the back consists of the old frame-work, under-built, and filled in with new windows and bays. The work has been carried out from the designs of Mr. A. B. Deakin, of Castle-street, Mr. Richard Price being the contractor; Mr. John Davies executed the glazing; and the painting and decorating have been carried out by Mr. John Robinson, all of Shrewsbury.

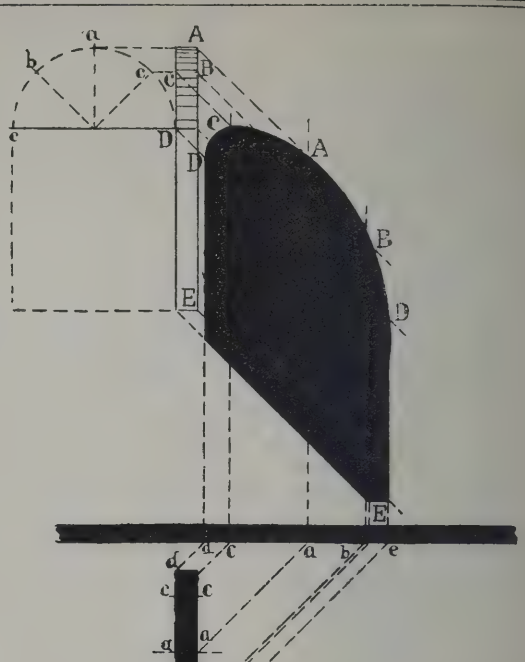

Fig 17.

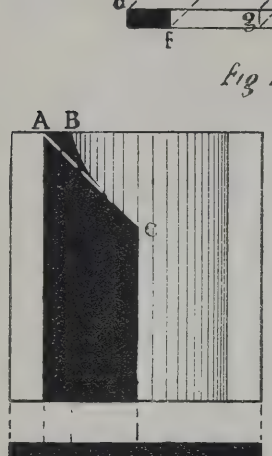

Fig 18

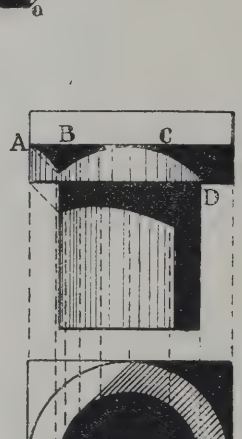

Fig 19.

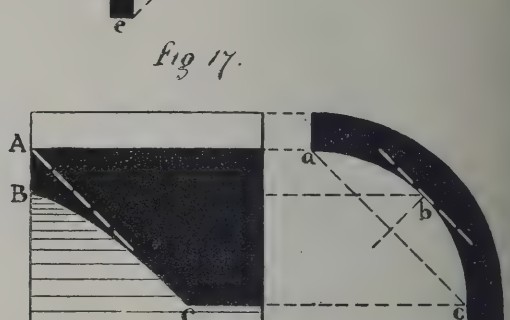

Fig 20

SHADOWS.—V.

THE shadow in Fig. 16 is obtained in precisely the same manner as that of Fig. 15 in the last article, the only difference being that the shadow in this case is projected against a convex surface instead of a concave surface as in the last example. We have to draw the shadow lines from the corresponding points in both plan and elevation, and then find the points of intersection in the elevation. The curve drawn through these points will give us the shadow on the convex surface.

At Fig. 17 we have the body A D E (seen edgewise) at right angles to the plane receiving the shadow; its front elevation is indicated by the dotted lines *e b a c*, &c. To obtain the shadow on the wall plane thrown by this body, we have firstly to take several points on the circumference of the head, such as *e b c a d*, in the elevation and mark off the corresponding points in both plan and elevation at *c b a d e* and A B C D. The rays of light at 45° strike the angles on plan at *d* and *e*; the intersection of the projection of these points with the lines at 45° from E in the elevation will give us the points E E; and being further raised, the points D D. The intersection of the lines *a* A will give us the shadow point A; and those of the tangent points *c b*, C B the shadow points C B. We join the points D E, E D, draw the curve of the shadow points D C A B D, and the shadow is comp'ete. Supposing that instead of being solid, the figure *c b a d*, &c., in elevation represented an opening, such as that of a window, the place now occupied by the shadow C A B D E would in this case be in the light, the surrounding portion of the wall plane being in the shadow.

Fig. 18 gives us the shadow of a semicircular niche. The line at 45° from the point *a* meets the concave surface at *c*. The intersection of the line projecting *c* with the shadow line from A in the elevation gives us the shadow of A at C. The shadow, however, does not commence at the point A, as often drawn, but from the point B, for the following reason: The rays of light striking at 45° on plan do not meet the concave inner surface of the niche until arriving at the tangent point *b*. It is, therefore, at this point *b* that the shadow commences. Raise the point *b* to B, and complete the shadow by drawing the curve B *c*.

At Fig. 20 we have a similar shadow, except that in this case the vertical plane is taken, the rays of light meeting the inner surface of the arch at the tangent point *b*, giving us *b* B as the point where the shadow should commence. The curve B to *c* completes the shadow.

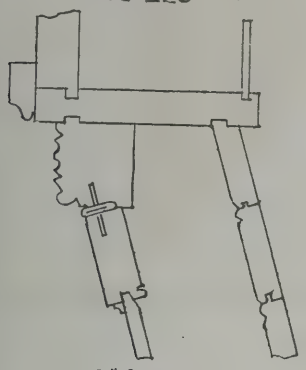
At Fig. 19 we have a round column crowned by a square and round capping. We have first to find the shadow of the upper square block on the round, and then that of the round cap on the column. In both plan and elevation we take any point, A B *c*, *a b c*. We draw the lines at 45°, and find the intersection of their projections. These points wi l give us the shadow of the square block on the circular cap. As a consequence of what we have often remarked above in regard to the distance of a shadow in proportio to the distance from the plane receiving th shadow, we find that the shadow of A B C wi take the same curve, and may be drawn with th same radius as that for the circular cap receivin the shadow. In the same manner we obtain th shadow of the circular cap on the column.

Arthur Vye-Parminter.

Palais des Beaux-Arts, Lille.

CARPENTRY AND JOINERY.—XXXIII

window finishing—(*continued*).



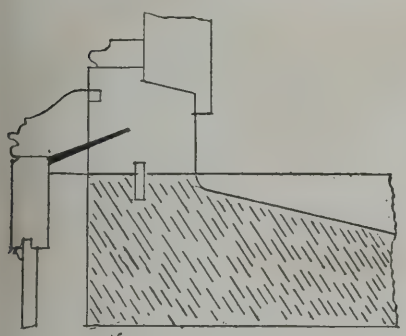
IT has been already stated that provision shoul be made inside of rooms in connection wit the sash-frame for *sun-blinds;* and it was show that by means of narrow, square, jamb-lining such means is in some cases provided. But will be obvious that when there are shutters o splayed linings, such will not suffice. Now th plan adopted in these cases is to introduce a *blin fillet*.

Fig. 225 shows a section of a blind fillet, inside casing of sash-frame, inner stile of shutter, o framed jamb-lining.

It will be readily seen that this gives additiona room for the backfold shutters, permitting them to be put in wider, so that it will not be n necessary to make each succeeding backfol narrower than the previous one in order to get into the box (provided there is more than one o each side). In wide windows it is not unusu

to have five backfolds in addition to the front shutters. It will be readily understood that the *blind fillet* may be varied as regards the moulding worked upon it. Adopting a blind fillet as described, then the window-back may have its *face side* in the same vertical line with the inner edge of blind fillet (that next shutter), and then the capping of the back would be of the same

FIG 225



2" Scale

width as the blind fillet, and suitably moulded, and the blind fillet would then be scribed to fit the capping of the window back.

Fig. 226 gives a simple capping for a window back, showing how it fits into window-frame sill, and also arrangement for receiving the window

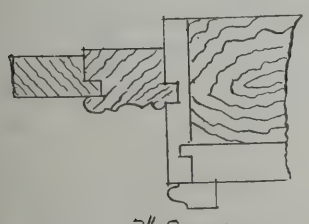


FIG. 226

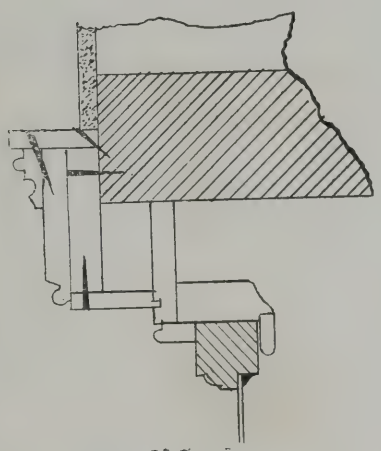
2" Scale

back. Let it be distinctly understood that no undercut moulding is suitable for a capping to window backs in these cases, and it should be of such outline as not to retain dust or water. In some superior work it is the rule not to allow the blinds to be seen when they are rolled or drawn up. In order to do this, the top blind fillet is kept high enough up on the top inside casing to allow for roller and strap, to which roller fittings

FIG 227

2" Scale



are screwed. It may not be considered necessary to mould the top blind-fillet at all, seeing that it is hidden away out of sight; this, however, is left an open question.

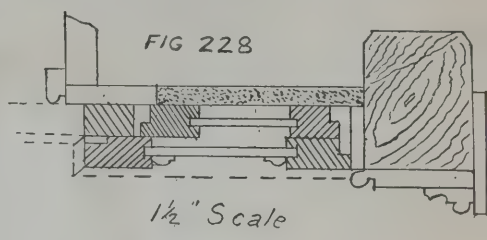
Fig. 227 will give the reader an idea as to what is meant by keeping up the top blind-fillet. In making the sash-frame, blocks should be put in between the top outer and inner casings in order to strengthen for the blind-fillet. The side fillets will be scribed to fit the top, and the top, being nailed down through into the ends of the side fillets, strengthens the top very considerably. It is better to fix the fillets to the casings with screws, as they will be more firmly held, and there will be less shaking of and tendency to unsettle screeding, &c. Sufficient has been stated about this style of shutters, and a somewhat common method of finishing a window with shutters will now be detailed. It is found in use for kitchens in middle-class houses and in parlours of common property.

Fig. 228 shows the plan of such finishing. A hanging or hingeing piece is attached to the inner casing of sash-frame, showing a suitable margin from the edge of the inside casing, say ¾in. or 1in., and to this the front shutter is hinged, say, with 3in. butt hinges, the bead on the edge of the front shutter corresponding with the knuckle of the hinges; the backfold turns in behind as shown, and as is seen, the hanging piece provides room for this.

The total width of the shutters is the space between the two *hanging* or *hingeing pieces*, and the workman will just have to arrange the width of the front shutters so as to suit, knowing beforehand that he can usually only have one backfold at each side. The window back fits in between the two hanging pieces; these need not reach to the floor—in fact, the simpler way is to let them rest on the capping of the elbows. The elbows are exactly fair with the front shutters, and if the outer stiles of the back are left 1in. broader than the line of hanging piece, this would serve as a good grounding for nailing the elbow to, and at the other (outer) stile it can be nailed to the grounding which has been prepared for it.

FIG. 229

2" Scale



The capping of elbows and back has usually a ¾in. bead worked on the edge. In fixing this finishing, the hanging pieces can be put up first, and the front shutters hinged to these, and then all the other finishing put up to suit.

Fig. 229 gives a section through finishing at the top, showing inside casing, batten slip, part of hanging piece, lining piece, which forms *soffit*, and should be continued right along and terminate at the inside of the capping of each architrave. It will thus form a good ground for the top architraves under edge, which is very necessary on account of its great length. It shows also architrave, lintel, and grounding piece nailed against the lintel so as to prepare for nailing architrave to. The great objection to this style of shutters is that when the window hangings are in position they have to be held aside whilst the shutters are being closed or opened, which, of course, is considered troublesome. Another, and somewhat common, method of shutters, is to have them sliding just in a similar way to sashes, and parallel with the sashes.

This requires a frame somewhat similar to a sash-frame, and which is fastened to it (the sash-frame), but it is continued down under the level of the floor, the distance of course being according to the height of the sash-frame.

Fig. 230 gives a plan of one side of such a frame. It is seen that the stile of shutter frame requires to be wide enough to accommodate the two shutters, parting bead, a piece between inside casing and first or outer shutter, and also the thickness of the back. All this is clearly shown in Fig. 230, as also architrave, capping weights, and parting lath. It is seen that the shutter-frame stile is rebated for the window back; above the back a piece is nailed on, or better, screwed on, so as to

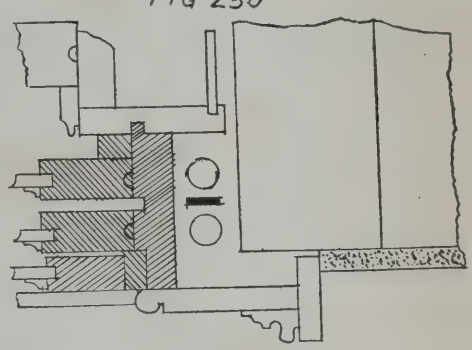


FIG 228

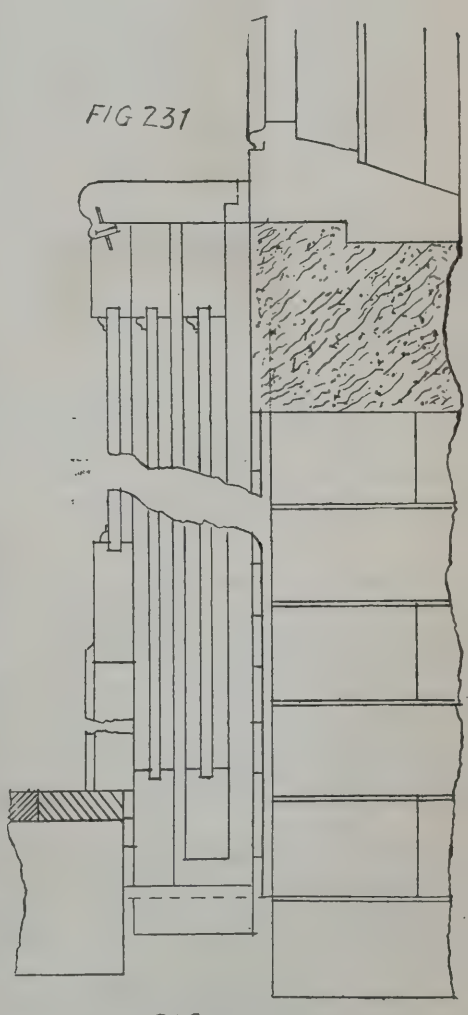
1½" Scale



be readily taken off in case one of the cords should break: it can then be taken off and the shutter got at readily. It will be noted that in order to have no interruption to this, the archi-

FIG 230

2" Scale

FIG 231

2" Scale

trave must have its beaded edge just fair with the inside of shutter-frame stile.

Fig. 231 gives an elevation of these shutters from the sill of the shutter-frame to the sill of

the sash-frame. Rough boarding is nailed on the stiles of shutter-frame, so as to inclose in the shutters below the level of the floor, the *covering flap* shown hinged to the window back, and falling on the rebated piece nailed against the sill. During the day when the shutters are down the flap covers them and prevents an unsightly hole, and when the shutters are up it forms a rest for the bottom (inner) one. The height of the shutters for this style of finish will be readily obtained from the lath, or *rod*, on which the sash-frame and sashes have been set out in elevation; as, of course, the height will extend from the rebated piece, shown in Fig. 231 nailed against the sill, up to the head of shutter-frame, which will show the same margin from the top of the sash-frame as is shown at the sides. Then the bottom rail of the outer shutter and top rail of the inner one should just be opposite to each other, only one being seen when the shutters are in the closed position. These rails should be just opposite the meeting rail of the sash. The old-fashioned style of thumb-screw sash-fasteners is used to secure the shutters at the rails opposite meeting rail of sash, and there are lifting rings attached to plates let into the top rail of each shutter in order to lift them by, and if thought necessary *flush handles* may be let into the bottom rail of each shutter so as to draw it down by. In some cases where great economy is practised there is only one shutter, reaching up to the meeting rail of the sash, and this prevents any one from seeing in unless the person gets upon the stone sill. Again, where no objection is made on the score of cost, the cords suspending the shutters are covered by a board of the necessary width, which is hinged to the piece which is fastened against the inside casing, between the shutter-frame stile and the edge of inner casing; this piece in such case would be rebated to provide for the board, this board is turned round against the sash before the shutters are raised, and, of course, to allow the flap covering the shutters being lifted so that the shutters can be raised. The board covering cords may be ornamented by any suitable moulding, so as to take away its *plainness*, and should also be *clamped* at the ends if plain, or pieces *dove-tailed* in the back so as to prevent its warping if moulded.

CHIPS.

Castle Cliff of Crail, near the East Neuk of Fife, has been restored at the expense of Mr. George Duncan, of London, a native of the Royal burgh. The castle was the residence of Constantine and King David I. of Scotland, and the cliff has now been converted into an elevated promenade by the erection of a concrete wall 9ft. thick and 262ft. in height, protected by iron railings at the top.

The public library at Birkenhead was reopened on Friday after redecoration and repairs—works carried out by Messrs. McLachlan and Batkin, of that town, under the direction of Mr. Thorburn, borough surveyor.

The Capital and Counties Banking Company are about to build a new bank at Guernsey. The floors will be of fireproof construction on Fawcett's system.

A stained-glass memorial window has been placed in the Westborough Unitarian Church, Scarborough, by Mr. H. E. Morton, in commemoration of his golden wedding. The work is from the studio of Messrs. Powell Bros., of Park-square, Leeds, and illustrates the parable of the Good Samaritan and Christ blessing little children.

Works of water supply are being carried out for the local board of Audley, Staffs, from plans by and under the direction of Messrs. Ford and Slater. About eight miles of water-mains have been laid, the contractors being Messrs. King, Masterman, and Terry.

The Spiritualists' Hall at Walsall was opened on Friday. It is of brick, and contains two halls of equal size, one on the ground floor, and a loftier one on the first story, the latter being 34ft. by 50ft., and 22ft. high. The total cost has been £1,500. The architect was Mr. W. Jackson, and Mr. R. Evans has been the builder.

On Saturday last a new shelter was thrown open to the public at Middleton. Standing on an elevated site, very fine views of the surrounding country can be obtained from the building. It is built with local bricks and terracotta dressings, and the roof is covered with red tiles. The gables and gablets in roof are finished black and white, and the building is a neat example of Old English style. Mr. T. A. Fitton is the architect; and Messrs. E. Partington and Sons the builders.

Building Intelligence.

Blackwater.—The Passmore Edwards Institute at Blackwater, Cornwall, was opened on Thursday, the 14th inst. The institute is situate in the centre of the village, and has been built and furnished entirely at the expense of Mr. J. Passmore Edwards, proprietor of Building News, *English Mechanic*, the *Echo*, and *Weekly Times and Echo*, who has also provided the committee with 500 volumes as a nucleus of a library. The main entrance has over it a large stone, subscribed for by the villagers, the subscriptions being limited to a shilling, and on it are inscribed the following words:—"This building was erected by J. Passmore Edwards, Esq., of London, and presented to the inhabitants of Blackwater, his native village, A.D., 1890." Mr. Spargo, of Truro, executed this work, and the masonry of the building was done by Messrs. J. Prowse and Son, of Scorier. The building has been erected by Messrs. John Symons and Sons, the head of the firm acting as architect.

Brighton.—An addition to the decoration of the interior of the old parish church of St. Nicholas has been made in continuation of the chancel decoration. Three years ago a parishioner erected the cross which surmounts the screen, and subsequently a cornice was added to the screen. This was followed by the entire re-decoration of the chancel, in accordance with designs by Mr. C. E. Kempe and Mr. Somers Clarke, jun., of Dean's-yard, Westminster. The walls of the chancel arch, together with the front of the bays on either side, and ceiling over these bays and the screen, are now being decorated. The designs, which are by Mr. Somers Clarke, jun., have been carried out under his direction by Messrs. Powell Bros., Kentish Town, N.W. The ground-work upon the wall above the screen is of toned white, the floral design, arranged in a zigzag pattern, being in dark red; while on either side of the cross are placed shields, symbols of the Passion, these shields being inclosed by scrolls in blue and yellow. The ceiling, as that of the chancel, is in square panels, with ribs of yellow and black and with gilt bosses. The ground-work in these squares is of terracotta, the designs being alternate, consisting of wreaths picked out in toned white and in black. The cornice supporting the ceiling over each bay has been picked out in white and green, upon a light neutral green ground. Under the cornices are the words of Psalm cxlviii. 1. The lower portions of the bays are diapered. The screen is also undergoing partial redecoration.

Edinburgh.—At the Dean of Guild Court, the trustees of the Scottish Episcopal Church have obtained a warrant to make additions and alterations upon Coates Hall, at the west end of Grosvenor and Lansdowne Crescents, for the purpose of converting it into a training college in connection with the Church. An addition, three stories in height and 65ft. long by 33ft. broad, is to be erected at the north-east corner of the present building. In it accommodation will be found for the Forbes Library. In the present building will be located the class-rooms and dining-rooms, the upper floor as well as part of the new building being utilised for bed-rooms and bath-rooms for the students. A new porch and a chapel with open timber roof, a bell turret at the angle of the old and new buildings, and lodge at the principal entrance are also included in the scheme, which is to cost £3,500. The present style of Coates Hall is Scottish Baronial, and the additions, which have been intrusted to Messrs. Sydney Mitchell and Wilson, are to be carried out in the same spirit.

Haydock.—New Congregational Church and school buildings are about to be erected at Haydock, Lancashire, from the designs of Mr. T. W. Cubbon, architect, of Birkenhead, by Miss Evans, of Briars Hey, Rainhill, in memory of her late father, Mr. Richard Evans, proprietor of Haydock Collieries. The church will be provided with seating accommodation for about 650, and the school for about 350 scholars. The buildings, which are Late Gothic in character, will be faced with Ruabon bricks, relieved by red sandstone dressings; a handsome tower and spire has been arranged at the left of main front. The schools, which occupy a position to the right of church, have ample class-room accommodation for adults, and infants at the rear. The cost of the buildings will be over £6,000.

Melbourne.—Building operations are in progress at both the cathedrals in this city. The Roman Catholic one of St. Patrick, on Eastern Hill, is 13th Century in style, designed by Mr. W. W. Wardell, and the various contracts up to the present time have been carried out by Mr. John Laing, of Sydney, under the personal supervision of Mr. Denny, who has been the clerk of works since the commencement in 1860. The total amount expended to date is about £160,000, and the estimated cost of completion £70,000 more, or a total of £230,000. The principal items are the central tower, £20,000; the two western ones, £10,000 each; while £5,000 (in addition to the present contract, £25,000) will allow for finishing all interior fittings, carvings, &c. The complete plans show the extreme length of the building to be 320ft.; the length of the transept being 162ft. The nave and aisles are 76ft. wide, the transepts being the same distance across. The height to the summit of the central tower will be 260ft.; the western towers being each 203ft. high, while the gables and crosses are 100ft. from the ground.—St. Paul's Cathedral is Decorated Gothic in style. The original estimated cost was £100,000, but increasing the length of the nave, and other alterations, have involved an extra outlay of £10,000. Of this amount over £96,000 had been expended at the end of 1889. The extreme external length of the building is 273ft., and its extreme width 126ft. The nave from the main entrance in Flinders-street to the central tower is 164ft. long, the choir 91ft., and the transepts measure 35ft. each. The roof of the nave is carried by clustered columns, composed of alternate bands of freestone and bluestone, and this alternation of colour is carried out all through the building. The central tower is open for a height of 100ft., where it is closed in with a panelled wood ceiling. The ceiling of the nave is also of polished wood, with moulded ribs, and has a total height of 75ft. The principal features will be the southern towers, and the central tower and spire, which will be 275ft. in height. Sitting accommodation is provided for 1,500 persons. A tiled dado runs all round the interior of the cathedral, the colours chosen being a contrast of sage green and reddish brown. The pulpit, constructed of blackwood, is fixed in position, as well as the font, which is Gabo Island red granite. The bells have been hung for some months. The organ, by Lewis, of London, will cost £5,000. The reredos is ready for fixing, and the internal fittings are in an advanced condition.

Portsmouth.—The Town Hall was opened recently by the Prince of Wales. Besides the areas allotted to the Municipal Offices, there are provided on the ground floor a spacious public library and reading-room, together occupying 5,260ft., and an additional space under the great hall of 1,100ft. for store-room purposes. On the principal floor, in addition to the Borough Court, borough engineer's offices, surveyor's offices, &c., there is a great hall, 129ft. by 70ft. 7in., including an apsidal projection at one end to receive the organ. This room accommodates 2,000 persons. It is 60ft. high to the panels in the coffered ceiling, round which is a cove, pierced by semi-circular windows that light the hall above the adjoining roofs. On this floor are also placed the Mayor's reception-room, parlour, and banquet-room; also a Council Chamber, Committee-rooms, and School Board offices. The style is Roman, entirely carried out in Portland stone. A rusticated basement, with a plinth, above which are the ground-floor windows, reaching to the surbase, 17ft. from the ground level, runs all round the building. From this surface starts the order of columns and pilasters, also surrounding the building. These are 3ft. 4in. in diameter, and 10 diameters in height, and run through two floors, with a stringcourse marking their division, the surbase marking the level of the principal floor. The columns and pilasters carry an entablature and a balustrade. In the centre of the east front, and standing 21ft. in advance, is a hexastyle portico 57ft. wide, reached by a pyramidal range of steps. At each side of the portico is a loggia 57ft. long and 6ft. 6in. deep, with four columns in each, and double pilasters at the angles. In the centre of the east front, immediately behind the portico, rises the clock tower, the lower stage rising without a break for 29ft. It terminates in an open cupola, the whole reaching to a height of 206ft. from the ground. The building has been erected from the designs of the late Mr. William Hill, of 25, Park-square, Leeds, and finished from the drawings and details

prepared by his son, Mr. William Longfield Hill, who was appointed by the Council, in conjunction with Mr. C. W. Bevis, of Southsea, as resident superintendent architect to complete the works. The contractors for the whole of the works are Messrs. Armitage and Hodgson, of Camp-road, Leeds. The sub-contractors were—plumber and glazier, Messrs. H. Braithwaite and Co., of Swinegate; plasterer, Mr. J. P. Mountain, of St. Paul's-street; slaters, Messrs. Pickles Bros., Canal Basin; and stained glass, Mr. G. Lazenby, Connaught-buildings, all of Leeds. The total cost of the building will be about £120,000, exclusive of land. The quantities were supplied by Mr. Linley Oldroyd, of Leeds.

Poplar.—The new church of St. Frideswide, Follett-street, Poplar, for the Christ Church Oxford Mission, was recently dedicated by the Bishop of London. The church accommodates about 600 people, and is of brick, faced externally with red bricks with Chilmark stone dressings. The cost was about £3,600, or about £6 a sitting. It consists of nave and chancel under one roof, with a narrow aisle on the north side, which will be used as a morning chapel. The choir and clergy vestry are placed outside the east end, which terminates in an apse. The nave and chancel are 38ft. wide. The altar is raised ten steps above the nave, giving it a very bold aspect. The organ-chamber is situated in a small transept on the north side. The site, which is very cramped, is wholly taken up by the church, except a portion at the west end, on which a narthex is to be erected when funds permit; the space is now partly occupied by a temporary iron porch. The building has been erected from the designs and under the superintendence of Mr. R. Willey, F.R.I.B.A., 66, Ludgate-hill, E.C.

CHIPS.

The pictures which Sir F. Burton has bought of the Earl of Darnley with part of the annual grant to the National Gallery are two by Paulo Veronese and one by Tintoretto; they are about 6ft. square each, and were exhibited with other pictures from Cobham Hall at the Royal Academy in the winter of 1877. They will shortly be hung at the National Gallery.

The town council of Bathgate, near Edinburgh, have adopted a drainage scheme for the burgh prepared by Messrs. J. and A. Leslie and Reid, of Edinburgh.

At Tipperary Petty Sessions on Friday, Mr. R. R. Gill, architect, New Tipperary, was sentenced to fourteen days' imprisonment, with hard labour, and to keep the peace for twelve months, on a charge of assault. Constable Smith swore that the accused, when passing along the street, deliberately struck his left shoulder against him. Mr. Gill declared that the officer refused to make way for him, whereupon he simply brushed against the constable when passing.

An infirmary and isolation wards are being added to the workhouse at Cuckfield at a cost of about £3,800. Mr. William Beach, of Hayward's Heath, is the architect, and Mr. W. Pledge, of East Grinstead, the contractor.

The Linsdale Institute, Leighton Buzzard, is being warmed and ventilated by Mr. E. H. Shorland, of Manchester, by means of his patent Manchester grates and inlet and outlet ventilators.

Extensive alterations and additions have been made to the Primitive Methodist Church, Exmouth, Devon. The chapel and schoolroom have been lengthened by about 30ft.; new gallery erected with ornamental gallery front of horseshoe shape (made by McFarlane and Co., of Glasgow); open colonnade built in front of church, and in the rear five new classrooms, minister's vestries, &c. The church has been re-seated throughout with new rostrum, &c., all in pitch-pine. Messrs. Kerley and Ellis, of Exmouth, are the architects; and Messrs. Cooper and Son the builders.

The Bristol Docks Committee received, on Monday, a letter from Mr. J. Ward Girdlestone, tendering his resignation of the appointment of engineer to the Bristol Docks, an office which he has held for the past eight years.

The town council of Stirling have deferred to a committee the consideration of the advisability of restoring the old Mercat Cross on its original site in the centre of Broad-street. The cross was erected in 1473, and was taken down in 1793.

Mr. Lynch, Hillford-road, Hampstead, was, at the Marylebone Police-court on Tuesday, fined five pounds and costs for neglecting to put into proper repair the drains of 16, Queen's-crescent, Haverstock-hill. The premises, said to be ill-ventilated and full of sewer gas, were used as a bakehouse.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—L. G. I. Co.—M. Bros. and Co.—J. D. and Co.—C. of B.

Correspondence.

COTTAGES WANTED.—TO BUILDERS.

To the Editor of the Building News.

Sir,—I should be obliged if you would allow me sufficient space in your next issue to direct the attention of capitalists to the crying need for additional cottage property in this part of my parish. The opening of the new railway-station in the village and the development of the Dock estate have caused such an increase of population that I do not know of a vacant cottage within a radius of two miles—and several places that are called such are scarcely habitable.

The wealthy and enterprising firm who are at present expending over £7,000 per annum in wages at the Dock estate tell me that they suffer inconvenience from the lack of insufficient dwellings for their workpeople. If instead of multiplying houses where there are already too many, respectable builders would direct their energies to this field of speculation, it would be found more profitable to themselves and more beneficial to the cause of Christian philanthropy.—I am, &c.,

John J. Stevenson Moore,
Vicar of Dagenham.

The town council of Coatbridge, N.B., accepted at their last meeting the offer of Mr. John A. Warren, of Glasgow, to provide a survey plan of the burgh for the sum of £585.

New elementary school buildings will at once be proceeded with at Ashton-in-Makerfield, from the designs of Mr. Thomas W. Cubbon, architect, of Birkenhead, and will be erected at the expense of Miss Evans, of Rainhill. The schools have been designed to accommodate about 650 children, and will be two stories in height. The ground floor will be devoted to the infants' department, and the first floor used as a mixed school. The buildings will be faced with Ruabon bricks—the dressings of red sandstone. The cost is expected to be about £4,000.

Intercommunication.

QUESTIONS.

[10342.]—**Sanitary.**—I shall be glad if some reader could tell me the name of the plant or weed which, grown in a sewage-pond, helps to deodorise the contents?—H. O.

[10343.]—**Falmouth.**—Can any reader give me any information as to architectural works worth visiting near Falmouth?—H. G.

[10344.]—**Coke Breeze Concrete.**—I have a specification worked from in 1887, in which some floors are described as having some coke-breeze concrete 6in. thick, covered with ½in. thick of pitch, and then floor boards laid on and nailed. Will some reader kindly say how the pitch should be used, and if it will require mixing with any other substance to make it work?—L. S. N.

[10345.]—**Colouring Cement.**—Can anyone inform me what method I should employ to colour cement a buff tint, and whether, if so tinted, it is better to use Robinson's cement or the ordinary Portland-cement? The work is required on the upper part of a cottage gable.—Westlake.

REPLIES.

[10323.]—**Posts of Wood, Strength of.**—J. McA. has omitted several items in his quotation of formulæ for the breaking weight of pillars of wood. Hodgkinson's formula for solid square dry red deal columns with both ends flat, *when the length exceeds* 30 *diameters* is $W = 7{\cdot}81\frac{D^4}{L^2}$. This does *not apply* to pillars shorter than 30 diameters, but in such cases must be corrected by the formula $W' = \frac{W \times c}{W + \frac{3}{4}c}$, where W' = true breaking weight W = breaking weight as found by formula for tall pillars, c = the crushing force in tons for one square inch in section of the material × *sectional area of column in inches.* The definition of this factor c is imperfectly described in the reply referred to, though the working out is correct; hence, perhaps, J. McA.'s failure to understand its application. Hodgkinson considered the pillar as having two functions, one to support and the other to resist flexure, so that when the pressure necessary to break the pillar is very small on account of the greatness of its length compared with its lateral dimensions, then the strength of the whole transverse section of the pillar will be employed in resisting flexure; when the breaking pressure is one-half of what would be required to crush the material (in lengths between 10 and 30 diameters) one-half only of the strength may be considered as available for resistance to flexure, whilst the other half is employed to resist crushing; and when through the shortness of the pillar (lengths under 10 diameters) the breaking pressure is so great as to be nearly equal to the crushing force, we may consider that no part of the strength of the pillar is applied to resist flexure. Thus he assumed that the real breaking weight would be equal to the breaking weight as obtained for the long column (yielding by bending only) multiplied by the force requisite to crush it without flexure; and divided by the same two quantities added together, minus the pressure which it would support as flexible, without being weakened by crushing. Applying the above formulæ to the given example—

$$W = 7{\cdot}81\frac{10^4}{10^2} = 781$$

$$W' = \frac{781 \times 2{\cdot}5 \times 100}{781 + \frac{3 \times 2{\cdot}5 \times 100}{4}} = 201{\cdot}6 \text{ tons,}$$

when crushing strength of small section = 2½ tons per square inch, or 232·9 tons if crushing strength = 3 tons. The other formula quoted by J. McA. is that of Mr. Lewis Gordon deduced from Mr. Hodgkinson's experiments, with Weisbach's value of constant a; d = least thickness of rectangular pillar *in inches*; S = sectional area in square inches, and the other factors as given. Applying this:—

$$W = \frac{2{\cdot}5 \times 100}{1 + \frac{120^2}{250 \times 10^2}} = \frac{250^2}{394} = 158{\cdot}6 \text{ tons.}$$

When F = 2½ tons, or 190·36 tons when F = 3 tons. The factor of safety should be taken as $\frac{1}{10}$ breaking weight.

Pillars of wood are seldom *fixed* in the sense used in formula—i.e., by having flat capitals and bases, therefore their strength is reduced in such cases to considerably less than that given by the above formulæ.—F. E. Gay.

[10325.]—**Landscape Gardening.**—"Iota" would do well to consult Repton on "Landscape Gardening," and Milner's work on the same subject, lately reviewed in the Building News. The principles may be soon mastered; but I should recommend "Iota" to observe and study the effects of landscape, those of paths and drives upon undulating ground, clumps of trees, as they appear in connection with buildings.—G. H. G.

[10328.]—**Ripon Minster.**—This cathedral is collegiate. The crypt is Early Norman, also the chapter house, date 1069-1100. The Lady-chapel is Late 15th-century. The west front and towers are Early English. Transepts and choir date from 1154, eastern part of choir, 1233-1300 There is an Early Decorated east window. The choir aisles are 14th century. Nave dates from 1460-1520. The lancet windows of west front were filled in with Decorated tracery, it is thought, by Wykeham, but in the recent restoration the original lancet windows were restored. Archbishop Walter Grey, who built the south transept of York, the choir of Southwell, was the builder. Illustrations have appeared of this edifice in the Building News. Sir G. G. Scott restored the cathedral 1861-1872. The central tower, which fell, was rebuilt in 1459. See Walbran's "Ripon."—G. H. G.

[10329.]—**Sanitary Authority.**—"Tenant" can certainly apply to the sanitary inspector.—H. L.

[10330.]—**Rolled Iron Joists, &c.**—The general

formula for finding area of either of flanges at centre of girder supported at both ends is $\frac{W\,l}{8\,s\,d} = a$. Where W = live and dead loads distributed in tons, l = span in feet, d = depth in inches, and s = safe strain per square inch of metal on the flange in tons. I would recommend "Student" to get one of Homan and Rodgers, or Measures Bros. and Co.'s illustrated tables of the safe loads on thin rolled joists for different spans and loads, as this means of ascertaining would be more re iable than any formula worked out. These are a few examples of safe load for a 10ft. length of joist. If breadth of flange is 3in., depth of joist 5in., thickness $\frac{3}{8}$in., the safe load is 1·15 tons. For a 4in. breadth of flange, 8in. depth, and $\frac{5}{8}$in. thickness, the safe load is 3·6 tons; for 5in. breadth, 10in. depth, and the same thickness, the safe load is 5·8 tons. A joist 6in. broad on flange, 12in. deep, and $\frac{3}{4}$in. thick, will bear safely 11·0 tons. Hurst gives the following formula when the depth is more than $\frac{L}{14}$. Breaking weight in tons in centre $= C\,\frac{A\,D}{L}$ where A = area of bottom flange in inches, including one-fourth of whole depth of joist, C = constant = 7 for rolled iron, D = depth of joist in inches, and L = length in feet.—G. H. G.

[10331.]—**Church Needlework.**—In answer to "Designer's" query *re* church needlework, I beg to be allowed to inform him that Mrs. Austen, 35, Castle-arcade, Cardiff, designs and executes altar-frontals, hangings, &c.; and can give him any information thereon. —Ecclesiasticus.

[10333.]—**Rood-Screen.**—A very fine example of a rood-screen in oak is to be seen across the chancel of the new church of St. Agnes, Kennington Park. The church is a good example of modern erection, designed, I believe, by Mr. J. Oldrid Scott. Fine brass-work grilles or panels fill the lower compartments of the open screen; the rood-loft or beam is supported by richly-groined arches; and above it is a large carved crucifix, with carved figures on either side of the Virgin and St. John, painted and gilded. Several fine examples are to be seen in Devonshire and Norfolk.—G. H. G.

[10334.]—**Design not Carried Out.**—"Young Architect" is entitled to charge 3 per cent. on the whole tender, and an additional 2 per cent. on the amount of the work not carried out.—H. L.

[10337.]—**Stoup**—Is a small basin to contain consecrated water placed on the right-hand side of the entrance to a Roman Catholic Church. Parker, in his "Glossary," gives several English examples. Sometimes they are formed in a small niche, like a piscina, other examples are hollow projecting basins like corbels.—G. H. G.

[10338]—**Beam.**—Let A B be the beam 32ft. long, of which the portion A C, 24ft. long, is uniformly loaded with 1½cwt. per foot run. This is equal to the total load of 30cwt. (34 × 1½) acting through its centre of gravity, which is at a point 12ft. from A and 20ft. from B. Therefore—

$$\text{Reaction at A} = \frac{30 \times 20}{32} = 18\tfrac{3}{4}\text{cwt.}$$

$$\text{Reaction at B} = \frac{30 \times 12}{32} = 11\tfrac{1}{4}\text{cwt.}$$

H. Carter Pegg.

[10338.]—**Beam.**—A beam 32ft. span loaded with 1½cwt. per foot run to within 8ft. of one end, will have a reaction at the loaded end of one ton, and at the other a reaction of half a ton approximately.—S. S.

[10340.]—**Board Schools.**—Robson's work on School Building is one of the most comprehensive and best treatises, 2nd edition published in 1877. For technical schools, E. C. Robins's "Technical School and College Building" may be consulted.—G. H. G.

CHIPS.

The school board for Ecclesfield, near Sheffield, have adopted plans by Mr. G. A. Wilson, of Sheffield, for a new girls' school at Hillsborough.

Mr. Wineberg, a master cabinetmaker, was summoned, at the Worship-street Police-court, on Saturday, for non-payment of wages to a workman, who was one of a group put upon work at a price stipulated. An increase of remuneration was demanded, and refused. In cross-examination, witness admitted having written a letter to the newspapers stating that he would like to hang all Social democrats. The summons was dismissed.

A neolithic cave burial has been discovered at the Distillery at Oban. A few stone implements, many human and some animal bones, and *débris* of shell-fish have been found.

On Sunday afternoon the Bishop of Shrewsbury laid the foundation stone of a new church for the Roman Catholics in Gatefield-street, Crewe. When completed the church will consist of chancel, side chapels, nave, aisles, baptistery, external porches, confessionals, &c., with priests' and working sacristies connected to the presbytery by a cloister. The height to the top of the tower will be 90ft. The cost will be about £4,500.

The name of Alderman George Kett, of Cambridge, of the well-known firm of wood-carvers, has been added to the commission of the peace for that borough.

Additions have been made to Messrs. Hodgson's Brewery, Kingston-on-Thames, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the extraction of the vitiated air being effected by the latest improved form of the Self-Acting Air-Pump Ventilator.

Our Office Table.

Members of the Society of Architects who propose to take part in that body's well-planned excursion into Kent will probably be interested in looking up and reading our issues of August 6, 13, and 20, 1886, wherein the visit of the Architectural Association to Maidstone and Rochester was fully described and illustrated. The ground covered by both societies is very largely the same, Tonbridge, Knowle House, Ightham Mote, and Sevenoaks being items in each programme, in addition to the county town and city already named.

The Government have decided to utilise the eastern and western galleries at South Kensington as the National Gallery of British Art. A connecting gallery will be made, with a central hall for sculpture, and the buildings will be united with Mr. Collcutt's Imperial Institute, a façade being made to each gallery in harmony with the Institute. In accordance with suggestions made by Captain Shaw, some slight alterations will be made to render the building more nearly fire-proof. Curiously enough no architect was included among the experts (five in number) called in to advise the Lord President of the Council and the Chancellor of the Exchequer as to the suitability of the buildings for their intended purpose. It is satisfactory to find that the gallery will not be under the control of the Science and Art Department, but will be managed by an independent board.

The twelfth annual congress of the Sanitary Institute will be held at Brighton next week. The meetings for addresses, papers, and discussions will take place in the Pavilion-buildings, and a Health Exhibition will be arranged in these buildings, the Corn Exchange, and Museum, remaining open until September 13th. At the opening meeting on Monday evening an address will be delivered by Sir Thomas Crawford, M.D., and on Tuesday, Section I., "Sanitary Science and Preventive Medicine," will be inaugurated by an address from Dr. G. Vivian Poore, and will be followed by papers and discussion. Professor T. Roger Smith, F.R.I.B.A., will open Section II., "Engineering and Architecture," by an address on Wednesday morning, and papers and discussions will follow on that day and on Thursday. A conference of medical officers of health will also be held on Thursday, and on Friday, Section III., "Chemistry, Geology, and Meteorology," will sit under the presidency of Mr. William Topley, of the Ordnance Survey, and a conference of inspectors of nuisances will take place. On Saturday sundry excursions will be organised, and in the evening Dr. B. W. Richardson will deliver an address to the working classes in the Town Hall, in which he may be expected to develop some new Utopian suggestions.

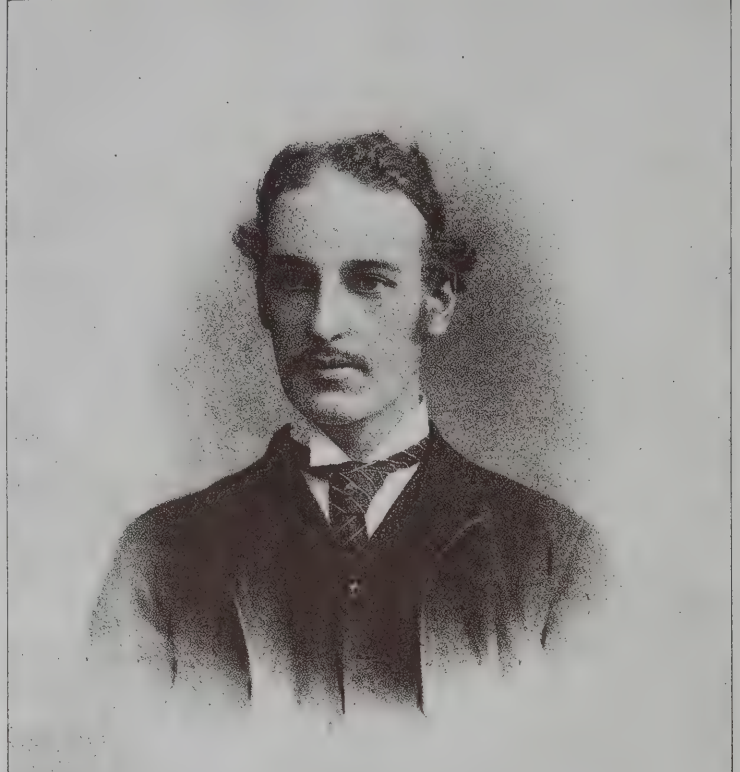
At the recent meeting of the British Medical Association at Birmingham, a resolution was passed: "That this public medicine section of the meeting of the British Medical Association approves of the system of education, examination, and registration of plumbers, and of the formation of a committee and local centre for the purpose in Birmingham, and expresses its hope that the memorial addressed to the Plumbers' Company be approved and acted on in the interests of public health."

At the last meeting of the Privy Council on Education a letter was read from Mr. Z. Mellor, town clerk of Rochdale, dated the 8th inst., stating that the town council of that borough proposed to make grants under the powers conferred upon them by the Technical Institution Act 1889 to certain institutions in Rochdale for the promotion of technical instruction, that at one of these institutions instruction was given in the following subjects, which are not included in the branches of science and art with respect to which grants were at present made by the Department of Science and Art—viz. (1) cotton-spinning, (2) cotton-weaving, (3) cloth-weaving, (4) plumbers' work—and that in the opinion of the town council such a form of instruction was required by the circumstances of its district. The education committee sanctioned the form of instruction, and will lay a minute before Parliament to that effect.

The first architectural exhibition yet organised in Italy will be opened at Turin next month. It will be inaugurated on Saturday, Sept. 20th, and will close on November 28th. In the International Division, the section will comprise:—1, plans for cities; 2, projects for enlargement and general and partial sanitary regulations; 3, complete designs for edifices, as regards ways and means of construction; and, 4, rules and regulations for buildings. Medals and diplomas will be awarded by an international jury. All intended exhibits must be forwarded prepaid to the Committee before Monday week, September 1st.

LEGAL INTELLIGENCE.

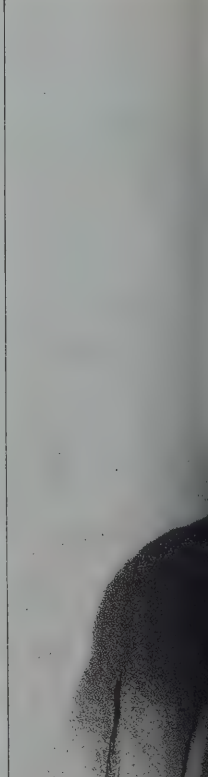
£100 Damages for Defective House Drainage.—At the Leeds Assizes, held last week, before Mr. Justice Wills and a special jury, Henry Brumby, builder and contractor, of Sheffield, was sued by George Baruch Wood, mechanical engineer, and his wife, for damages for breach of contract, and also for alleged fraudulent misrepresentation upon the sale of a house in Machon Bank-road. Defendant sold the house to plaintiff, and stated that the drains were all right; but plaintiff and his wife, who took no formal warranty, were rendered seriously ill as a consequence of the defective drainage. Mr. Charles F. Wike, now, and for the past two years, borough surveyor of Sheffield, deposed for plaintiff that, after examining the property in February last, he wrote the defendant complaining of the unsatisfactory manner in which the drains had been laid, but he received no reply to that communication. Witness refused to give a certificate that the house was fit for habitation, and ordered the plaintiff to uncover all the drains for inspection. They were subsequently relaid, in accordance with the requirements. Defendant said he personally inspected the works while the house was building, and was informed by his men that an inspector of the corporation had passed them. He thought the drainage was efficient in every way. He had been in business for 25 years, and had erected over 120 houses. He had a dozen or more houses inhabited now, for which he had no final certificate from the borough surveyor. In the end, the charge of fraudulent representation alleged against defendant was withdrawn, and he then agreed to a verdict against him of £100 damages, carrying costs.



Serious Charges against a Builder and Plumber.—Wm. Davis, 44, builder, of Queen's-road, Upton Park, and Thomas Raisbeck, plumber, of Gartary-road, Canning Town, were charged at Westminster Police Court on Friday, on a warrant, with being concerned in obtaining a large quantity of goods by false pretences from Messrs. Burt and Potts, wholesale ironmongers, of York-street, Westminster, and also from Messrs. Farmiloe, glass and lead merchants, of Rochester-row, Westminster. On the 7th inst. the prisoner Davis, with a hired van, proceeded to Messrs. Burt and Potts' establishment, and obtained over a ton of iron hooping and rods on account of Messrs. Prestige and Co., well-known customers of the firm, from whom, however, it was stated he had no authority whatever. By a similar misrepresentation he was said to have obtained kegs of white lead, colours, varnish, solder, oil, brushes, &c., of the value of £34, from Messrs. Farmiloe. These goods were carted away, some ostensibly to a job at Hendon, but in reality to the prisoner Raisbeck's house, where a detective discovered rolls of zinc in different rooms, besides twenty-two painter's brushes under a bed, all identified as the property of Messrs. Farmiloe and Co. Prisoners were remanded.

WATER SUPPLY AND SANITARY MATTERS.

Duffield Waterworks.—The Belper Rural Sanitary Authority have instructed Mr. W. H. Radford, C.E., of Nottingham, to report on the best mode of obtaining a water supply for the villages of Duffield and Duffield Bank, in Derbyshire.



A Seamen's Institute is about to be built at Cardiff, in Bute-crescent, replacing the old man-of-war *Thisbe*. The new building will have, on the ground floor, the seamen's institute and reading-room, accommodating 400 people; the chaplain's room, and caretaker's apartments. On the first floor will be a church seating 450 persons. The building will be constructed of ballast stone, with brick facings, and a red-tiled roof. Mr. E. W. M. Corbett is the architect.

The restoration of Hanmer church, which was destroyed last year by fire, is approaching completion. The new bells have been swung. During the past month some interesting relics have been brought to light. In a small hole of the tower was found a casting of a rose in plaster of Paris, with the date 1644 scratched on the side of the block. In the foundations of the south wall has been found a window-sill with a single light in a deep red stone.

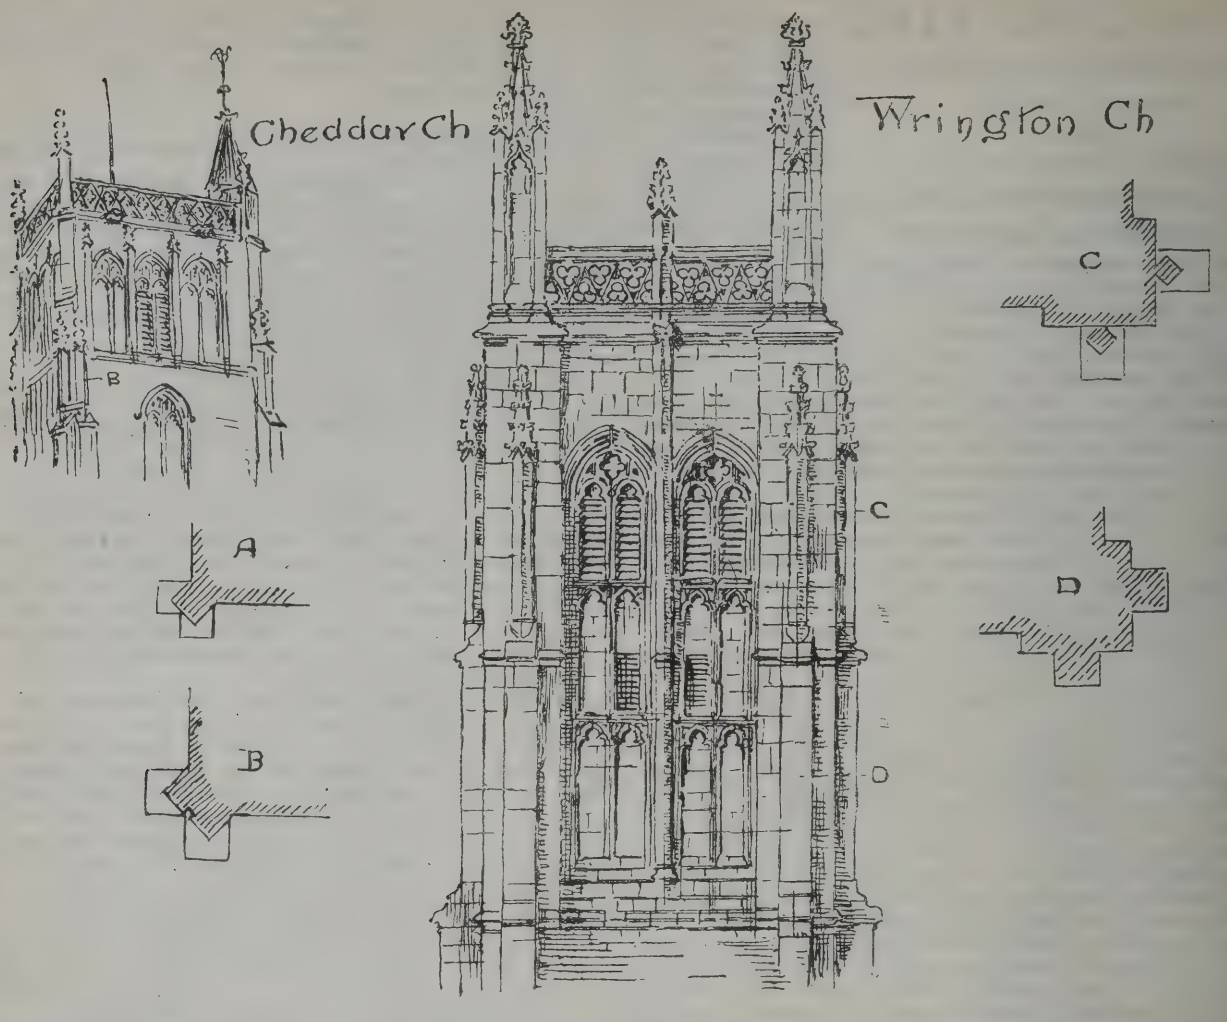
FRIDAY, AUGUST 29, 1890.

THE BUILDING OF BASEMENTS.

OF the many problems of building that present themselves to the architect in owns, the design and construction of a eally well-lighted sanitary basement is one f the most important. But sanitary experts nd architects have alike failed to make the nderground stories of buildings what they night be made. The views of Dr. Richardson, xcellent as they are, appear to have had ittle effect in regard to house-building, and he hygienic models and house arrangements hown at the late Health Exhibition at South Kensington, are a long way from being ealised. The Sanitary Congress, now holding ts meetings at Brighton, have been consider- ng the question of basements and overcrowd- ng; but the practical part of the problem has carcely been dealt with. And yet we have ll the necessary elements of hygienic onstruction. We have a system of house- rainage which can be made absolutely erfect, by which the house can be cut off rom the sewers, and means of excluding urface water; we have damp-proof materials or building walls, damp- and air-courses o prevent the absorption of moisture rom the ground, systems of hollow walls, hich practically admit air currents and ntercept the damp from the inner portions; e have means of reflecting or refracting ght into basements by "semi-prism" lights; ooring of improved construction—all of hich things we can introduce. Still we ppear to be practically unable to employ ese things to the best advantage, or we omit o do something upon which the success of e other expedients greatly depends. As the ealth and comfort of a building so largely epend on the manner in which the founda- ons and external walls are constructed, so as o cut off the soil and its moisture and emana- ons from the upper floors, it seems to us ecessary for architects to direct their atten- on to the discovery of some more efficient ethod of building than that usually adopted.

In the first place, the idea of erecting our uilding on stilts or piers would be practi- able if it could be shown what use could be ade of the lower stories. Where store- oom was required this mode of building is o doubt reasonable, presuming that access the first-floor can be gained without fficulty. In some districts, in which the vels are low, the raising of the bottom oors of houses appears to be the only pre- aution that can be taken with any hope of vercoming the inundations caused by heavy ainfalls and high tides. If, as suggested in ese pages before, the level of our roadways ould be adjusted to the buildings on each de, and the pedestrian and carriage traffic onfined to a high-level road and footways, iving access to the ground floor of the reet buildings, and the heavy traffic made use a lower road on a level with the iginal ground, we might see a very de- rable reform in London and many of ur great commercial cities. Suppose, for ample, over the present level of Cheapside road and footways were raised clear of the uses by some feet on either side, and form- g a viaduct on iron girders some 12ft. or ft. above the level, with lateral bridges to e floors of the houses—let us imagine on eir first-floor level—immense relief would given to traffic. The lower or present round stories could be utilised as basement llars for storage of heavy goods, the high vel road made to serve the pedestrian and ghter traffic. The present lower basements, sometimes flooded, could be done away with. "High" and "low-level" roads would at once double the space, lighten traffic, and avoid accidents; but at present the idea is too Utopian to be entertained.



The question of how to build a basement below the ground level that shall be free from contamination of ground air and moisture, is the one which we now have to face. What should be the idea of a structure of this kind? The most feasible answer is that the lower story should be designed like a watertight tank, at least as high as the sills of the basement windows; that it should, if possible, be constructed in an air space or excavation larger in both directions. There should also be an air space below the floor. These requirements appear to suggest, instead of basement walls carried up from the foundation, a series of short piers and apertures, the joists resting on girders carried on the piers supporting the floor-joists or flat arches of the lower floor. Above the piers solid walls would be built within an area to the required height. Asphalte could be used to render the walls impermeable, as a lining on the outer side, or to fill up a cavity; the floor would be covered with the same material, or the wood-block flooring laid on it. In the impermeable walls, the fresh air could be introduced through channels in the walls from a higher level. Cement concrete offers itself as a valuable material with which to construct basement walls, as being less permeable than brick with mortar joints. The air space all round, or the area, would keep the inner room dry, and if water entered from the outside, or found its way up through the soil, the tank-like structure would resist all percolation. In towns the area all round could not be formed; but in front and rear, continuous areas would effectually exclude all flooding. Building legislation could make such construction absolutely invulnerable. We should like to know if the by-law proposed by the Local Government Board has been enforced in any town under the Public Health Act. This provision is that when the floor of the lowest story is below the level of the surface of the ground, so that the ground is in contact with the exterior of the wall—the said story is to be inclosed with double walls, having an intervening cavity of 2½in., extending from the base of such wall to 6in. above the surface of the ground adjoining. An asphalte or damp-course is inserted just above the highest course of footings, on a level with the concrete layer over the site. Upon this level the double or hollow wall is built to the required distance above the ground-surface outside, and another damp-course is put on. Thus the cavity and the lower and upper damp-courses completely cut off the interior wall from that against the soil. But does it? Actually, if there is any soakage matter or flooding outside, the outer wall of brick allows the water to percolate and fill up the cavity, and to permeate the inner thickness, so that the check is not a practically efficient one. The only way to make it so is to form an outer area, or to face the outside of wall with asphalte before filling in the earth. The outer air area is one of the desiderata of modern house-building, and it is one of the weaknesses of our legislation that it is not made compulsory in all cases. In streets the area could be covered level with the pavement by gratings filled with lens lights, and the walls could be built of concrete. This area need not be wide for the purpose intended. In the amendments to the Metropolitan Building Act we should like to see the question of basement construction taken up. It cannot be expected that our houses will be dry or healthy if the lower stories are sunk into damp sewage-saturated soil, and no care is taken to drain the soil below the floor level. These are points calling for immediate attention. Other towns will follow the example, if they see that the Metropolitan authorities have taken up the matter of underground stories.

TYPICAL CHURCH TOWERS.—I.

FEW features have received more attention from the artist's pencil than the tower. Poets have sung and painters depicted the beauties of structures that have served to awaken memories or rekindle the imagination, to give character to or throw a charm over the landscape. We might say much on the poetry of the tower as one of the phonetic elements of architecture; but we restrict our remarks to a limited branch of the subject. We desire to point out the distinguishing variations found in certain English towers, how much locality, circumstances, and materials have favoured distinct varieties. The Italian Towers or campaniles, such as the ruined towers of Pisa, of S. Apollinare ad Classem, Ravenna, and that of Sta Maria in Cosmedin have a fascination for architects and painters, and their beauties have been dwelt upon by many; but how comparatively little has been written on the church towers of our own country from an architect's point of view!

Our present remarks are confined to English types of towers, and we now refer *par excellence* to those of Somersetshire—a county noted for its noble and highly-wrought examples. Indeed the churches of this part of England are, perhaps, richer and fuller of interest to the architect and ecclesiologist than those of any other part. The prevailing Perpendicular style appears here to have attained its full beauty of expression in tower-building; for what towers elsewhere can we compare to those of Taunton, Wrington, and St. Cuthbert, Wells, for magnificent proportion and graduation of stories; or, as in the latter two instances, for the lofty belfry and its majestic vertical lines? The architects of these structures were masters of the art of tower-building; they appear to have reached perfection in the horizontal division into stages, and in the beauty of corner pinnacles and pierced parapets; and with the desire to do something bolder and more striking, they have thrown the last two or three upper stages into one by having two or three magnificent belfry windows, which give nobility and character to the tower as seen far or near. This change in the design of towers is one that seems to us to have been suggested in the first place by the desire to produce a more imposing simplicity than could be produced by a low belfry story or with small, short windows on the other plan, and possibly also to lighten the masonry by concentrating the bulk of the work in the angle piers.

The graduation of the tower into stages by horizontal divisions is necessarily one of the first considerations in the design of these structures, and the Mediæval architects early saw the value of dividing the stages to suit the perspective effect. Anything approaching equality of divisions was avoided; hence we find that the first story was made at least as lofty as that of the lines of the church parapets or ridges. The middle story was of less height—not more than half that of the lower—as we see in the tower of Huish Episcopi, a 15th-century example, crowned by a belfry story of greater height, and a richly perforated parapet, with battlemented crest and pinnacles. The three stories are harmonious in gradation, and the windows singularly well proportioned. More advanced is that of St. Mary's, Taunton, a later work (restored by Sir G. G. Scott), dating from about 1500, and divided into four stories, the two centre ones equal spaced, but barely exceeding together the lower story, and the upper belfry stage not quite equal to them in height, crowned also by a lofty pierced battlemented parapet, broken by

corner and intermediate pinnacles. It is interesting to compare these with the tower of New College, Oxford, a massive and simple work of about 1400, with its plain angles without buttresses, its two low centre divisions, and the small piercings of the three lower stories, not larger than loopholes, and its plain solid battlement at the top. Yet with its angle octagon turret it has a charm of its own—a charm derived to a large degree by the three horizontal string-courses, which divide the tower into four unequal stories. There is, perhaps, no rigid rule for this division, except the one that the lower and top stories should be of greater height than the intermediate, the greater height being given to the lower story. At Wrington, the belfry stage divides the tower into about two equal parts.

Another principle to which prominence is given in these examples is the arrangement of the windows. In some examples vertical lines bound the width of the windows from top to bottom—that is, the same width of wall or pier occurs on both sides of the openings, as we find at Huish, and St. Mary's, Taunton. In the last, vertical members engaged to the walls, finished as pinnacles at each story, divide the window spaces into two compartments in the three upper stories, the lower large window being in one, but of the same width as the total width of the two above. The same arrangement is seen in the tower of Wrington Church, where the wide Perpendicular window directly over the entrance is exactly the same width as the two lofty belfry panels or windows above. But this rule does not generally apply. The tower at Winscombe, a fine tower of five stages, has the windows of varying widths and sizes, the intermediate stages having small ones, as at Cheddar, St. Mary Hutton, and others. What is especially worthy of notice in these towers is their unlikeness in these particulars to such structures as the Magdalen Tower, Oxford, and to some of those of the Norfolk and Suffolk type, in which the lower stages of the tower are comparatively quiet and unpierced, and the belfry windows and panelled embattled parapets assume a rich character. Among these we particularly note the elegantly-finished upper stage to the ancient massive tower of Stow-on-the-Wold, Gloucestershire, with its pierced embattled parapet, quite plain below—a class of towers numerous in that and other counties. But there are distinct differences to be noticed when we compare the Somersetshire with the East Anglian towers, the latter having also a reputation for massive quiet dignity in the structural lines and for rich Perpendicular detail. Compare, for example, Cromer, Worstead, and South Repps church towers with those of Wrington and Evercreech. There is an observable difference in the belfry treatment of the former: the windows are comparatively small, and do not fill the width of tower at this stage; in both at Repps and Cromer there are square openings in the intermediate or ringing story filled with tracery and labelled, while the lower story has a large Perpendicular window just above the western entrance and in connection with it. As our readers are aware, the masonry is largely composed of flint, and the panelling of the buttresses with "flush work" is a feature. Then the treatment of buttresses, parapets, and pinnacles is very unlike that seen in the Somersetshire examples. The upper stage of the angle buttresses are simply weathered, and have not the amount of the stonemason's cunning lavished upon them; the pinnacles rise generally from the angles, and do not spring out of the buttresses, and the parapets are less in height and less perforated. But the chief variation is in the arrangement and proportion of the windows. The upper stories of these towers are lower, and the windows smaller. At Cockfield the deep angle buttresses give a pyramidal outline to the structure, and impart dignity to it. The middle stage on the west front is severely plain, and the structure is crowned by a solid battlemented parapet. More elaborate is the Perpendicular tower of Lavenham, a noble example of deep buttresses and well-marked parapet, but still very unlike the West Country types.

It may be of interest to notice a few of the characteristic peculiarities of the North Somersetshire towers. They are generally western, joined to the nave by a lofty archway vaulted internally. Professor Freeman distinguishes three types: (1), "The Taunton type with a staircase turret at one corner and double buttresses at the others, all the pinnacles being of equal height, the tower being divided into stages by horizontal string-courses. Examples: St. Mary Magdalene and St. James, Taunton, The Abbots, Bishop's Lydiard and Huish. (2), The Bristol type, with a prominent turret, crowned with a single spirelet rising above the rest: St. Stephen's and St. Werburgh's, Bristol; Yeovil, Banwell, Cheddar. (3), The Wrington type, which dispenses with the staircase turret and horizontal divisions, and is panelled with two enormously lofty belfry windows, with pinnacled turrets of the same height: St. Cuthbert's, Wells; St. John's, Glastonbury; and North Petherton. Spires are very unfrequent, and are often imperfect, as at St. Mary Redcliffe [till completed within the past twenty years], Yatton, Shepton Mallet, Minchinhampton. Perfect spires exist at Congresbury, Bridgwater, Frome, Croscombe, Castle Cary, Trent."

We do not concern ourselves with the spire-crowned tower, but deal with the second and third of Mr. Freeman's types in our present remarks. Our sketch of the upper part of the tower at Cheddar represents the characteristics of a large number of

owers in this part of the country, notably hose at Winscombe (a very similar design ncluding the spirelet and turret, the three anels or windows, and the arrangement of uttresses and pinnacles), Locking, and Iutton and Axbridge. Narrow angle uttresses, four stages, the three upper ones aving the windows of the same design. In he front at Cheddar is a large window above oor; canopied niches and figures are placed n each side of the window on the second tage. The two upper stages are shown in ketch, the centre one of the belfry being ierced. The tower is placed in continuation f the nave at west end; there are two aisles, transept on south side, with entrance, and north porch of unique design. The church as flat roofs and pierced parapets. The eneral view of the tower, with the back-round of the Mendip hills as seen from the ilway station, is very pleasing. We draw otice more particularly to the manner the ngle buttresses are formed. In the third age, above the set-off, the buttress is agonally placed, and forms a couple of ngaged pinnacles, terminating below a plain ngular buttress splay (see plans A and B). uch of the elegance and beauty of the lfry story is due to the triple-window rangement, divided by engaged buttressets pinnacles, an arrangement unique of its nd which one seldom sees in other towers this class. At Winscombe and Shepton allet the same design is met with, ading one to surmise that one archi-ct was engaged on all three towers. The erced parapet, composed of equilateral angles intersecting and quatrefoiled, is a ry general one.

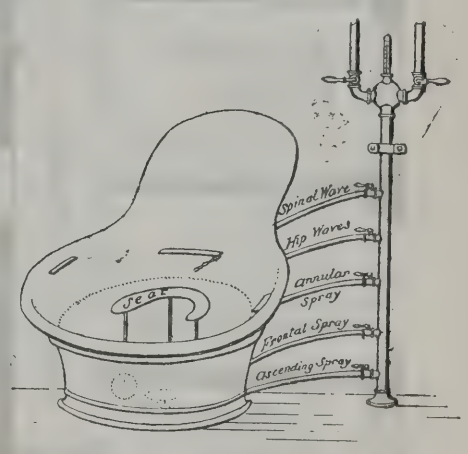
Our sketch of the belfry stage of Wrington ves a fair idea of the proportions as seen thin a moderate distance of this fine ucture, though a strictly geometrical view uld make the windows a trifle higher. e plan of church is of the usual kind, but s a very short nave, with aisles and a ith porch instead of transept. It contains rich Late oak-carved screen across the ancel arch, inclosing also the last bays of les. Many points are worth noticing in s magnificent tower: the lofty panels ided into three stages by transoms, the per only pierced; the admirable buttress sign, the gradation of the sets-off, the quisite arrangement of the angle turrets, h their corner pinnacles; the lower story, h its entrance and window united. To hten and relieve the mass of masonry at h angle of tower, the designer has cleverly ught his buttress within the outer gle of the walls of the tower; its width is s than the wall thickness. On the belfry ge the set-off in the tower is utilised to form angle pier for the pinnacle, while the per part shown on plan D is still further eved by the engaged pinnacles which ject from the face of each side of the pier. architect knew the value of a line of dow at the junction of pinnacle and angle, instead of cutting his square pinnacle in f diagonally, and placing the largest face t to the pier, he allowed it a three-quarter jection as shown at C, thus throwing out a strong shadow the pinnacle, and dis-aging its summit. A graceful outline is the result of this plan. The corner ret above is a square, with slightly pro-ing pinnacles at each angle, the external th of one face being equal to the width ier. Internally the tower is opened to nave by a lofty arch, and groined under-th.

We have given these two types as e of leading interest. That of Wrington which class also belongs the noble r of St. Cuthbert, Wells—is not only particular interest to the student tower architecture as being a bold rture from ordinary types, and a fine aple of stone masonry, but displays a ul economy in material, by the use of blank traceried panels in the upper portion, thus reducing the thickness of the walls without lessening their strength or rigidity.

THE HYDROPATHIC ESTABLISHMENT AND ITS BATHS.—X.

By R. Owen Allsop, Architect.

(Author of "The Turkish Bath: its Design and Construction.")



LOCAL baths, such as the sitz, spinal, head, and foot baths, need not detain us long. In themselves they are of paramount importance; but they are obviously simple matters. A foot-bath would be administered in the patient's dressing-room; and *spinal* and *head* baths are ordinarily provided in connection with the various before-described douche-room appliances; but in the classification that governs our consideration of hydropathic baths some simple form of head-washing and application of water bandages is possibly to be understood. The ordinary *sitz bath* is constructed in various forms. In a selection the comfort of the bather should, after effectiveness, be the chief consideration.

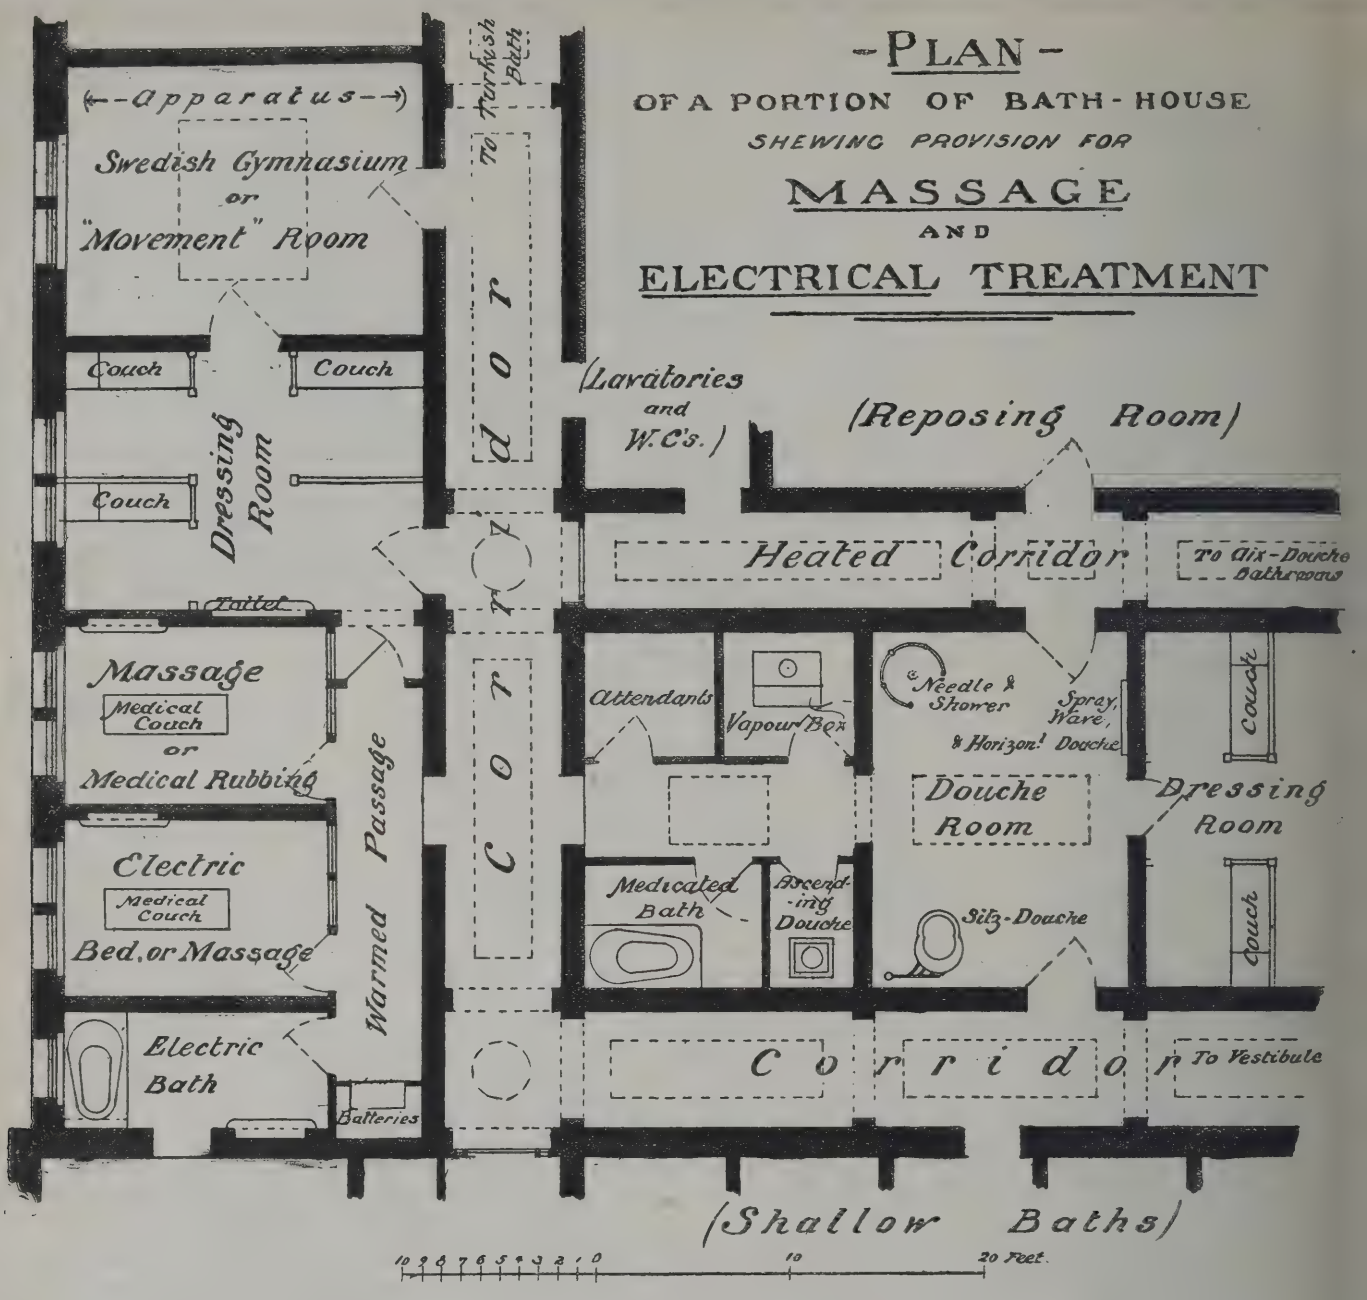
There is a broad distinction between sitz baths, in that one class is known as the *running sitz*. The ordinary cold sitz bath is filled with the requisite amount of water, and no change in volume or temperature—excepting, of course, by virtue of the heat abstracted from the bather—is made during the time of the bath. The running sitz, however, is provided with supply and waste, so that the original temperature of the water may be maintained, or the bath be warmed or cooled gradually as the bathman may require. Such baths must of necessity be fixed, and have waste and overflow at the proper height, with a regulating valve for the supply. Sitz-baths of this nature are usually fitted in convenient corners of the private dressing-rooms, as in the plan of the Dunblane baths illustrated p. 3, *ante*.

The *sitz-douche bath* is a most valuable appliance, worthy of the attention of the hydropathist. One form of this bath is shown in the accompanying illustration. It is of a type employed in Germany. As shown, it consists of a bath of the ordinary sitz kind, but fitted with the necessary pipes for the various tonic sprays, &c. A regulating valve, with thermometer to indicate the temperature of the water, connects with a series of pipes, each having a stop-cock. The first pipe supplies the spinal, or back wave, and the second the hip or side waves. The wave-like form assumed by the water is caused by its impinging against metal spreaders. The third pipe supplies the annular spray—a ring of holes emitting jets of water much as one of the ribs of a needle-bath. The fourth pipe supplies a spray directed towards the front of the bather, and the fifth supplies an ascending spray. In the ordinary sitz-bath the bather sits right down in the water, but in the sitz-douche, as illustrated, a seat of a horse-shoe shape is provided, and supported on three metal standards. The area of the seat is reduced to the least possible amount consistent with its purpose, so as to admit the water to play freely around the lower portions of the bather's body. This bath must have a capacious waste pipe. It should be placed in a douche room, or special chamber adjoining a douche room.

MASSAGE.

Turning to class (*f*) of the list hereinbefore given (May 30, p. 753), we find that massage may be included under the division of hydropathic remedies. Of late years the system of treatment called "massage," and consisting of *medical rubbing*, kneading, and otherwise manipulating the muscles of the trunk and limbs, has been greatly in favour, more especially in cases of rheumatism, and ailments of a like nature. In some respects what is called "massage," and the process of shampooing, as in the Turkish bath, are identical; in others they differ. Broadly speaking, the shampooer has to do with the *skin*—the *masseur* with the muscular and nervous systems. Massage may be *dry* or *wet*. The former is well termed "medical rubbing," and is properly administered only by persons who are sound and healthy and of high vitality, and able and willing to handle their patients in a sympathetic and intelligent manner. Dry massage, as its name implies, does not require the medium of water. In wet massage the part operated upon is kept wet, in one way or another. Plain wet massage is, to all practical intents and purposes, the shampooing of the Turkish bath intelligently performed. Different methods of applying the water to the patient may be employed, and the bench, seat, tray, or shallow bath upon which he is placed may be variously designed; but whatever the means and devices employed, the treatment and its ultimate effect is substantially the same, and as effective—probably more so—with simple resources as with complicated contrivances;

A Sitz-Douche Bath.



for massage, of whatever kind, consists primarily of the kneading and rubbing, &c., of the muscles of the trunk and limbs, with a view to restoring tone and vigour to the muscular and nervous systems.

When, however, the water employed in massage is directed with force and at high pressure upon the patient, the system of treatment becomes that known as the

AIX-LES-BAINS MASSAGE,

popularly styled the "Aix-douche." This method of massage with douching has been in increasing favour latterly in this country, and has been adopted at hydropathic establishments.* In all cases the treatment is modelled on that in vogue at the famous bathing establishment at Aix-les-Bains. As there arranged, the provision for the baths consists of bath-rooms having, for the sake of convenience and expedition in working, *two* dressing-rooms attached. In the bath-rooms are the appliances for the treatment, which consists of the massage of parts of the body upon which is directed, with more or less force, a stream of thermal sulphur-water. At Aix *two* bathmen are employed in giving the treatment to each patient, but by placing the hose-pipe supplying the douche over his shoulder, one attendant may manage by himself, though, of course, far less effectively. At Aix there is in each bath-room a back-wave on one side of the room; on another are various douches for the massage, having convenient lengths of hose; and on a third there are showers, &c., with which to conclude the process. The patient reclines on

* Very complete arrangements for the Aix-douche have recently been made in the bath-house at Dr. Rayner's Hydropathic Establishment at Malvern.

an easy wooden chair, or support of the *dureta* type.

There is necessarily much splashing in an Aix-douche bath-room; the waters must therefore be drawn off rapidly, and the floor must be sunk below the level of the adjoining bath-rooms, or be formed of perforated tiles, having a space beneath connected with the drain.

ELECTRIC BATHS, ETC.

Electricity may be applied to the body, for therapeutic purposes, in several different ways—either in a bath of warm water, or on a bed or couch, &c., and either from dynamos or batteries. A bath for electrical purposes is best formed of enamelled earthenware; the bather is immersed in water of a considerable temperature, and has copper plates, &c., so arranged as to pass a current through his body. An electrical bed consists of an ordinary medical bed, upon which the patient reclines, having one plate at the feet and the other on his chest or back.

Electricity has undoubtedly a powerful effect on the human organism, though little is really known as to its mode of action. This obscurity and uncertainty has unfortunately prepared a way for much harmless imposture and quackery in electrical treatment. Various methods of applying electricity have been tried, and various complicated treatments essayed. Nothing over and above the benefits of the simple, straightforward application of the electrical current to the body, has, however, so far as I am aware, been attained. Moreover, some of the methods of applying the electrical current are fraught with danger to weakly persons. In the electricity-in-water bath, the patient is immersed for some little time in water at a high temperature—a treatment eminently provocative of cardiac disturbances, besides having other objectionable effects. And as a matter of fact there would appear to be nothing more remarkable to distinguish the electric bath from the electric bed, other than the fact that on the one hand the semi-clad patient is kept comfortably warm through the medium of heated water, and in the other by heated air. A prolonged hot-water full bath is dangerous to some constitutions and debilitating to all; it oppresses the lungs and heart and prevents ventilation of the skin, by stopping perspiration. It would appear, therefore, that the best method of applying electricity to the human body for curative purposes is on the dry system — the electric "bed." The patient should be placed in a warm room on a dry couch, bed, or easy chair, &c. One of the most pleasant and, doubtless, most effective, methods of receiving the electric treatment is in the hot rooms of the Turkish bath, where specially constructed canvas-seated, easy-chairs, with copper plates and connections with batteries, are employed.

In making provision for the treatments above described—the Aix-douche, massage, and electricity—in the hydropathic establishment, it should be the aim of the designer to concentrate and render as compact as possible, so that there may be no space wasted, no needless building, and no unnecessary labour on the part of bathmen and attendants. Ordinary dry massage can be practised at the couch of the bather in the dressing-rooms of the bath-house, if these apartments are commodious and spacious, and comfortably warmed by means of hot-water pipes, or other heating arrangements. The patient will recline on an ordinary medical couch. In large, public, medical baths, a special room for dry massage will be provided. This room should be maintained at a temperature comfortable to the half-clad patient and masseur. It should, for the sake of both, be thoroughly well ventilated; and the lighting should be good, preferably from the top. For the sake of economy, this room might also be used for the "electrical bed." The same couch would serve both purposes.

Simple wet massage, in the hydropathic establishment, may be economically performed in the shampooing-room of the

Turkish bath. In a special room, for this treatment, there should be water-fittings, comprising hot and cold supply, basin, hand-bowl, and a rose or spray.*

Where, in medical bathing establishments, the Aix-douche is provided, no other form of wet massage will be necessary, massage being comprised in the Aix treatment. The Aix-douche necessitates, in any establishment, a special bath-room. It must be fitted with the appliances before described. For the sake of economy, in the hydropathic establishment, the ordinary dressing-rooms will be employed. In public bath-houses, two dressing-rooms should be conveniently connected with the Aix-douche bath-room, so that whilst one bather is receiving the treatment, another may be dressing or undressing as the case may be. These dual dressing-rooms should be always provided to bath-rooms of public bath-houses where the baths or treatment are of a special nature. A great economy is thereby effected.

Electric baths may be effectively provided in an ordinary bath-room fitted with a marble or glazed earthenware bath. The batteries can be placed on shelves in an adjoining chamber or closet. By similar simple means dry electric beds may be given in the couches in the dressing-rooms. In large establishments and public baths, a special bath-room for electric baths, and a special room for electricity without the medium of water should be provided.

In connection with a suite of massage rooms in a very complete public bath-house would be a room for the administration of the Zander system of mechanical calisthenics, commonly called the "movement cure," and consisting of a series of mechanical bodily exercises and mechanical manipulations for correcting tendencies to deformity and generally developing the physique. This room should be large, lofty, lantern-lighted, and perfectly ventilated, special attention being directed to the supply of an abundance of pure fresh air, regard being had to the increased respiration of the patient when under some of the peculiar methods of treatment. The simple "movement-cure" room, when provided, will only require a few of the more ordinary calisthenic machines. The complete fitting-up of a room or gymnasium with the machines made by Zander, of Stockholm, is a most expensive affair, and requires power-shafting for driving many of the appliances.† The plan given on preceding page shows a portion of a medical bath-house, and generally illustrates the remarks made on massage and electricity. It also shows a general douche-room, and the corridors connecting it with the miscellaneous bath-rooms, as before advocated. The baths are those of the gentlemen's department. The bath-rooms are 15ft. high, and the corridors 10ft., so that clerestory windows are available for lighting and ventilating the douche-room and chambers adjoining. The heated corridor forms part of a system allowing perfect intercommunication between the various baths without the necessity of the bathers' passing along chilly passages in a semi-nude condition.

* One of the most elaborate massage-baths ever arranged was erected some little time ago by Mr. John Heaton, of London, at the Malvern House Hydropathic Establishment, at Buxton. By an ingenious arrangement of pedals, &c., the masseur can throw jets of water over the patient, and this without for a moment neglecting the process of massage.

† In providing the Zander system of treatment, it will be necessary for the architect to inspect establishments fitted up for this special purpose. The most complete in this country is to be found at the Zander Institute in Portland-street, London, where a spacious room has been fitted up with every conceivable machine, at an outlay of no less than £11,000.

A TERRACOTTA REREDOS.

We have lately seen, at Messrs. Doulton and Co.'s works, Lambeth, a very finely-executed reredos in terracotta intended for St. John's Church, Notting Hill-gate, designed by Mr. Aston Webb, F.R.I.B.A. The design is in three main compartments, the centre one being the highest and having the "Crucifixion," and in the side panels are figures representing incidents in the life of St. John. These sculptural portions are the work of Miss Emmeline Halse, who, we believe, has presented her labour to the church. It is rather as a design in a material which Messrs. Doulton have made a speciality of their various manufactures that we here speak of it. The centre and side compartments are divided by very elegantly designed and modelled mullions, moulded and enriched, the upper portions are canopied by elaborate cusped arches and tracery of Perpendicular character crowned by an ornamental and very effective cornice. This work is composed of Messrs. Doulton's "cellular terracotta," which resembles in all essential qualities highly wrought stone, requiring no filling-in with concrete. The whole of the reredos has been constructed without moulds; the lines and mouldings are admirably true, and the jointings and blocks are without any of those painful irregularities or warpings which spoil so much ordinary terracotta work. We recommend architects to pay a visit to the works, and inspect the reredos, which will remain on view until the end of this month.

We may here take the opportunity of saying that Messrs. Doulton and Co.'s newly-patented method of making terracotta will be the beginning of a new era in its manipulation. The great objections to the ordinary process of manufacture, that of spending all the skilled labour on models and moulds, which formed no part of the executed blocks, nor guaranteed their being exact reproductions, and filling in the hollows with concrete, which often fractured the blocks, have been avoided by the new method. The cellular terracotta is made in perforated blocks, so that they are weight-sustaining—an important condition for building—instead of being hollow box-like blocks to be filled in with concrete, which often bursts on setting. Each block of clay is subjected to considerable pressure, is practically solid like stone, and can be worked upon directly, after the manner of masons' work, with templates and squares, while in a plastic state. We saw the initial block of moist clay being transformed into elaborate moulded and curvilinear work by mechanical and other means, which combine the skill of the modeller, mason, and potter; some finished by the lathe into perfectly-formed shafts for columns requiring no after-chiselling or "doctoring"; mullions, tracery, plain and intersected, cornices, arch mouldings, and other architectural details having the finest arrises and sharpness. These results are strikingly different from the old process, where moulds are used for the reproduction of models previously made in plaster. As no casting processes are employed, none of the restrictions they impose are required, the whole being, as it is called by Messrs. Doulton, "direct" work. The manipulative processes which each block undergoes enable the finished work to possess all the finer detail and delicacy which hitherto have been only obtainable with stone. Terracotta will now equal it in these qualities, and even the granular texture and colour of stone can be given to the clay product. The use of the cellular terracotta in its weight-sustaining capacity is an important point, which we purpose treating of in a future notice, with illustrations.

Our attention was also directed to a new sgraffito ornament in some figure-frieze panels on the new buildings of the firm—a kind of surface decoration that can be done inexpensively, and is very bold and effective in such situations.

NOTES ON BUILDING PRICES.—VII.

By John Leaning.

We continue our list of exceptions for Metropolitan vestry charges:—

St. Pancras.—As last.

	s.	d.
Flap trap and two lengths of pipe, 6in.	16	0
" " " 9in.	19	0
" " " 12in.	26	0

Kensington.—

Schedule of Prices.

EXCAVATORS, &c.

Digging, including every expense of taking up, stacking, and relaying surface pavements, strutting, fencing, shoring, and lighting, slinging pipes, supporting cellars, vaults, ovens, &c., and making same good if damaged through the execution of work. Providing all watching, hoarding, pumping sumpts, &c.

Filling in with layers of earth not more than 6in. in thickness, and well ramming same with punners of a proper weight, providing and using sufficient water for the proper consolidation of the earth; removing and carting away all superfluous earth, rubbish, soil, &c., and providing shoot for same, leaving road and footpaths free and clear as before commencement of works, and being held responsible for trenches and works for three months after completion of same. At per cubic yard—

	s.	d.
Not exceeding average depth of 6ft.....	2	0
" " " 10ft.....	2	3
" " " 15ft.....	2	6
" " " 20ft.....	2	9
" " " 25ft.....	3	0
" " " 30ft.....	3	3
" " " 35ft.....	3	6
" " " 40ft.....	3	9
" " " 45ft.....	4	0
" " " 50ft.....	4	6

TUNNELLING.

Driving headings, including all contingencies as above and hereinbefore set forth; raising excavated earth to the surface and carting away surplus (the shafts between headings to be measured and valued at foregoing prices). At per cubic yard—

	s.	d.
Not exceeding average depth of 20ft.....	4	0
" " " 30ft.....	7	0
" " " 40ft.....	8	6
" " " 50ft.....	10	6
Filling in earth to headings and well punning same. At per cubic yard....	2	6

CONCRETE.

To provide concrete, including all staging, planking, wheeling, and throwing same into any position required:

	s.	d.
Lime concrete composed of Thames ballast and Dorking lime mixed 6 to 1, at per cubic yard	8	0
Concrete composed of Thames ballast and lias lime filled in over, under, and around brickwork, at per cubic yard	8	
Portland cement concrete, mixed 6 to 1, at per cubic yard	12	0

BRICKLAYER.

The bricks to be No. 2 Burham's, according to sample to be seen at the surveyor's office, Kensington Town Hall. The mortar to be well mixed in the proportion of one measure of lime to two measures of sand.

The cement and sand to be mixed one and one, and not to be re-mixed when once set.

The brickwork in sewers to be measured as ordinary walls, and all openings in same to be deducted in full.

SEWERS, AND WORK CONNECTED THEREWITH.

Building or re-constructing brick sewers, including all labour, material, plant, tools, and every expense. The brickwork to be executed in neat, regular, and uniform courses, the joints to be well flushed in, and grouted solid, and neatly struck flush with the interior face of the work.

The price to include all cuttings, angles, and splays.

	£	s.	d.
Brickwork in mortar, at per rod reduced	17	0	0
Ditto in Portland cement, at per rod reduced	20	0	0
To build walls in mortar to a height not exceeding 10ft. above ground level, at per rod reduced.....	14	0	0
Ditto ditto above 10ft., at per rod reduced	15	0	0
Brick on edge in Portland cement, at per foot run	0	0	8
Rendering inside of sewers, sandpits, &c., with Portland cement ½in. in thickness, at per yard super	0	2	6

Cutting through brickwork and providing and fixing block, flap-traps, and two lengths of pipe, and make good same, and side wall of sewers, in brickwork and Portland cement:—

	£	s.	d.
6in. trap and 4ft. of 6in. pipe, each.....	0	10	0
9in. trap and 4ft. of 9in. pipe, each.....	0	15	0
12in. trap and 4ft. of 12in. pipe, each....	1	0	0
Bricklayer, per hour.....	0	0	9
Labourer, per hour	0	0	6
Excavator, with long boots, if necessary..	0	0	7
Watchman	0	0	5

PIPE DRAINS AND SEWERS INCLUDING EVERY EXPENSE.

To open the ground to the necessary widths and depths, and in conformity with the conditions herein before stated, provide and lay down pipes, fill in trench, and cart away surplus earth.

The pipes to be perfect in form and of a uniform

thickness, the sockets to be entire, the joints made good all round with Portland cement; the pipes to be properly bedded, if necessary, on concrete (extra) with a continuous bearing, the sockets being sunk, the inside to be cleaned out with a half-disc, block ends of pipes to be tightly fitted with ½in. wood discs.

Timber to be left in if directed and paid for extra.

	Not exceeding an average depth of	s.	d.

Timber left in trenches by direction of surveyor, the full value will be paid for; but no allowance made for shaping, waste, or fixing, or displacement and removal of earth or other material.

IRON-WORK.

	£	s.	d.
Side entrance covers, with safety grating, lock and key, as per sample, delivered on any job, each	5	0	0
Extra only fixing, each	0	5	0
Gulley grates, 18in. × 18in. × 6in., hinged as per sample delivered, each	1	5	0
Extra for fixing each	0	2	0
Ventilating gratings, according to pattern delivered, each	0	15	0
Extra for fixing each	0	1	6
Flushing box, fixed, each	0	12	6
Supply and fix manhole covers, or any other description of cast-iron plates, at per cwt.	0	10	0
Foot-irons, 1½in. wide, by 3in. thick, of flat wrought-iron, fixed in side entrances, per lb.	0	0	6

Note.—All work to be measured as it is left, without any allowance for extras, use, and waste, or any other charge whatsoever.

The foregoing schedule, besides the information it gives of actual prices, is a simple, but very useful, form for adoption in such cases:—

THE CITY OF LONDON.

The Commissioners of Sewers issue printed regulations, to be obtained on application at their offices, as follows:—Regulations and fees for hoards and scaffolds, open and closed areas, cellar-flaps, vaults, and coal plates. The Commissioners take up and reinstate paving, make connection with sewer, and lay drains from sewer to front wall of vault or building.

FEES FOR LICENSES.

FOR HOARDS.

	£	s.	d.
If to remain not more than two weeks, per foot lineal of frontage	0	0	6
If over two weeks and not more than four weeks, per foot lineal	0	1	6
If over four weeks and not more than eight weeks, per foot lineal	0	4	6
If over eight weeks and not more than twelve weeks, per foot lineal	0	9	0
For every month or part of a month beyond the twelve weeks, per foot lineal	0	5	0

FOR SCAFFOLDS.

If to remain not more than two weeks, per foot lineal of frontage	0	0	4
If more than two weeks and not more than four weeks, per foot lineal	0	1	0
If more than four weeks and not more than eight weeks, per foot lineal	0	3	0
If more than eight weeks and not more than twelve weeks, per foot lineal	0	6	0
If more than twelve weeks and not more than sixteen weeks, per foot lineal	0	10	0
For every month, or part of a month, beyond the sixteen weeks, per foot lineal	0	5	0

FOR RAKING SHORES.

If to remain not more than two weeks, each	0	5	0
If more than two weeks and not more than four weeks, each	0	15	0
If more than four weeks and not more than eight weeks, each	2	0	0
If more than eight weeks and not more twelve weeks, each	4	0	0
For every month, or part of a month, beyond twelve weeks	2	0	0

No fee, either for hoard or scaffold, to be more than £10.

When a license is renewed the fee is to be that which would have been charged had the license been taken out for the full time at first, less the sum of money already paid for the first license.

DISTRICT SURVEYOR.

In London the district surveyor's fees must be allowed for. The incidence of these is best learned from the Metropolitan Building Act. The principal points liable to dispute are, What is a building? What is a separate building? Who is liable for fees? and To what extent? The schedules of the Act state the amount of fees. There is an extra fee of 5s. per house under the Metropolis Management and Building Acts, Amendment Act, and By-laws, which is apt to be forgotten. It is also necessary to observe that when party-walls are cut into, raised, or otherwise added to, the fees for an alteration (half-full fees) will be charged for adjoining buildings. A very useful map, showing the boundaries of the districts of the various surveyors, was published by the *Builder* in 1887. There is also a compilation by Ellis Marsland, district surveyor for East Kensington, of "Rules and Regulations affecting Building Operations in the Metropolitan Area," which only requires to be better known to be appreciated as it deserves. The London estimator who has not already seen it will find it to his interest to obtain it.

(To be continued.)

The Congress of the Union of German Historical and Antiquarian Societies is to be open at Schwerin in September, and will last four days.

SANITARY CONGRESS AT BRIGHTON.

THE twelfth annual congress of the Sanitary Institute is being held throughout the week at the Royal Pavilion, Brighton. The inaugural address was delivered by the President, Sir Thomas Crawford on Monday night, who took as his chief topic the story of laws violated to the prejudice of health, and as surely avenged, even to death, as a penalty. The laws which governed the origin and spread of preventible disease were not merely physical, nor were they merely moral laws. They were both. There was a moral as well as a physical code which must be observed if men were to realise all that might reasonably be hoped for in preventive medicine. United efforts on the part of the learned professions in the cause of public health would do much to create a healthy public opinion on the importance of sanitary legislation, and the due administration of all laws bearing upon the health and physical condition of the people. But more was needed. Lessons in personal and domestic hygiene must find a place in the curriculum of the elementary schools before they could hope for the realisation of all that was practicable in the prevention of sickness and the prolongation of life. He desired to call attention to the wastefulness of ignorance in regard to sanitation in general, and domestic hygiene in particular; and the ample financial returns which all might realise by grappling vigorously with the question of disease prevention. Stated in round numbers, the loss to the army from non-effectiveness through sickness was equal to a force of 10,716 men. Assuming the cost of each soldier to be £1 per week, or £52 a year, a very low estimate, this loss by sickness amounted to £557,232. Sir James Paget, in 1884, estimated that the loss from sickness among the civilians between the age of 15 and 65 in England and Wales amounted to about one-fortieth part of the work done in the year by the whole population between these ages. Rather more than half this loss fell upon the domestic, agricultural, and industrial classes. Valuing these lost services as averaging one pound per individual per week, the loss to the annual wealth of the country from sickness among these classes alone amounted to £11,000,000 sterling. Sir Edwin Chadwick considered Sir James Paget's estimate too low by many millions, and that the burden of taxation, arising from this cause, was three times greater than the poor rate. Obviously the removal and destruction of all decaying organic matter was one important means by which amelioration was to be secured. Starve the microbe and save the man. This important principle was too often neglected in the present system of dealing with house refuse. As Dr. Parkes said, "The best method of getting rid of dust-bin refuse was to burn it." But of all the causes which contributed to the origin and spread of preventible disease, overcrowding was perhaps, the most important. Nothing short of prohibitive legislation would check this. Every human habitation, whatever its height, should have open spaces in front and rear, commensurate with such elevation, so as to secure a free and adequate supply of both air and light to every part of the building, and the number of persons inhabiting such a dwelling, or congregating in a place of public assembly, should also be limited to that for which its aërial capacity was pronounced by competent authority to be adequate. Another indispensable requisite was a full and continuous supply of fresh potable water of good quality. Pure air and water, the direct light of the sun, and absolute cleanliness, with ample space in and around our dwellings, were the best safeguards against the invasions of disease-producing micro-organisms. What evidence had they to show that sanitation had done, or could do, anything commensurate with its cost, to lessen sickness and to lower the death-rate? Thanks to the wiser policy pursued both in India and at home, the death-rate in the Army has been a steadily decreasing quantity. And yet the health of the Army was not as satisfactory as it should be, nor were the barracks in a reasonably satisfactory sanitary condition, but we might hope that the £4,000,000 just voted for barrack construction and improvement would remove all cause of complaint on this score. In civil life, too, we saw satisfactory results following sanitary improvements. In the quarter ending June the death-rate in London was 17·3 per 1,000, of which 2·5 only was from zymotic disease. Ten years ago the death-rate was 19·1 and twenty years ago it was 22·0 per 1,000. The showed steady progress, and was in happy co

trast to similar conditions prior to the completion of the main-drainage scheme. The Sanitary Institute had had difficulties to contend with. Even now its museum was in urgent need of further development to make it a faithful record of progressive advancement in sanitary engineering, to which the public could resort when in need of trustworthy means of solving sanitary doubts regarding their own domestic arrangements.

A DOCTOR ON ENGINEERS' FAILURES.

Section I, that of "Sanitary Science and Preventive Medicine," was opened on Tuesday by an address from Dr. G. Vivian Poore, who selected as his topic the Living Earth. He pointed out that of late years we had obtained the knowledge that the upper stratum of ground was teeming with organic life, a fact of prime importance to sanitarians. In our sanitary arrangements we have not sufficiently distinguished between the living mould of the surface and the dead earth of the subsoil. The living mould is our only efficient scavenger and filter. The panacea for all sanitary ills had been, and still is, drainage, and the sanitary offices should be kept away from the main structure of the house, and not, as was the filthy custom of the present day, be brought almost into the bedrooms. The Thames, the Liffey, the Clyde, the Mersey, and the Irwell are standing testimony to the failure of great engineering schemes, and the last scheme put forward with regard to the sewage of London, to convey it all to the Essex coast and cast it into the sea, is an experiment which, like its predecessors, may be productive of unforeseen results. A nation that fouls its streams and starves its soil is in danger of poisoning and inanition. A nation which imports a great part of its food and a great part of its manure, and systematically, and by Act of Parliament, throws all its organic refuse into the sea, is undoubtedly living on its capital. Our capital just now is undoubtedly considerable, but we are in a fair way to run through it; and when we have done so, who can forecast the future?

Sir Douglas Galton, in proposing a vote of thanks to Dr. Poore, objected to his opinion that the getting rid of refuse was not a question for engineers. He contended, on the contrary, that the present system was most desirable, and he also thought that had Dr. Poore taken the question of living water, as well as the living earth, he would have found that water was as great a purifier as the earth, and that, therefore, the present system was advantageous and important.

SANITARY CONDITION OF BRIGHTON.

Dr. J. Ewart read a paper on the sanitary advance of Brighton. Of the site of Brighton he said it would be difficult to find any locality endowed with so many physical advantages or unimpaired with so few defects. As to the drainage of the town, he emphasised the fact that the sewers were well flushed by filling capacious manholes with water and letting them empty with a rush. There was also a constant house-to-house inspection in operation to preserve household sanitation. Electric-light works had just been commenced by the corporation, a light which he regarded as the only real sanitary light available. Some discussion followed the reading of the paper, and a resolution was carried unanimously recommending to the council of the Institute the consideration of the expediency of introducing and promoting a Bill in Parliament making landlords and owners liable for all sanitary improvements in dwelling-houses.

Professor Corfield, M.D, gave a practical address on "House Sanitation from a Householder's Point of View," pointing out many matters, including defective dustbins and flues, leaky gas-pipes, drains, and overflows, which householders neglected, and which led to the propagation of disease, which could be prevented if they would only learn the elementary principles of house sanitation.

In the evening Mr. W. H. Preece, F.R.S., lectured on

THE SANITARY ASPECTS OF ELECTRIC-LIGHTING.

He argued that, electricity and light being analogous and identical forms of energy, the former was naturally the proper source of artificial illumination; that all other sources of artificial illumination being dependent on the absorption of oxygen, and resulting in the vitiation of the air, are injurious to health; and that the same authority that regulated the sanitation of dwellings and the supply of food should also control the purity of the air men breathed and the light they worked by. Compact areas covered by a radius of half a mile were best served on the low-pressure system. Those supplied beyond a radius of one mile could be served economically only on the high-pressure system. Everywhere the use of the electric light was increasing by leaps and bounds, and not only was it naturally the proper source of light, but economically it must eventually supplant its rivals.

On Wednesday, in Section I., the Hon. F. A. R. Russell read a paper on "A National Health Service," in which he urged that the health officers to all authorities, county and local, ought to be placed under the control of a department of the State, the presidency being undertaken by a Minister of Health.

PROFESSOR ROGER SMITH ON BATHS.

The address to Section II., "Architecture and Engineering," was given by the President of the Section, Professor T. Roger Smith, F.R.I.B.A., who took as his subject "Baths." Having referred at some length to the baths of the Romans, he passed on to consider the Turkish bath. As a good many attendants were wanted, considerable provision for them was requisite, and the bathers occupied a good deal of space, so that, altogether, a Turkish bath, which many persons attended, requires large and specially-arranged premises, and must, he feared, always remain a somewhat high-priced luxury. The vapour bath, when combined with a needle bath or spray, was capable of being used in any ordinary bathing establishment, and of exciting something of the same sort of action on the skin as the Turkish bath. This appliance it would be possible to introduce into establishments where inexpensive baths were given with advantage. Professor Roger Smith next spoke of the advisability of providing large public swimming-baths, perfectly heated and ventilated, and described the methods of construction and heating the same, and then turned to the other part of an establishment of public baths—the ordinary warm or slipper bath. He described the various forms in which these single baths are constructed. He admitted that while the operation of the Baths and Washhouses Acts had brought a means of bathing within the reach of large numbers of people, it had not gone far enough. They were not frequented to such an extent as to make them self-supporting; and the prices charged, though very moderate even if they reach the maxima of the Act, did not place the bath within the reach of every class of working people; while the mere fact that these establishments must be on a considerable scale, and therefore could not be very close together, removed them from the easy access of some of those who would use them if they could. Could we, Mr. Smith inquired, bring the bath nearer to the doors of the people, and could we give them a cheaper bath than anything accessible at present? In crowded towns and cities simple, cheap, and accessible bathing establishments, formed in crowded neighbourhoods, set up as a rule in existing buildings, and adapted to the wants and the purse of the crowd, would be popular and largely used; and his impression was that they could be made to pay their expenses, and possibly to yield a profit to those who established them. If so, few better openings for practical benevolence seemed to exist than the multiplication of appliances of this sort under prudent and careful direction, and he wished the subject might attract the attention of philanthropists.

BRIGHTON AS A HEALTH RESORT.

Mr. F. J. C. May, the borough surveyor, read a paper on "Brighton as a Health Resort." He described the improvements achieved during the last thirty years. After referring to the buildings, the groynes, and the sea-wall along the parade, he pointed out that the system of groyning adopted by his predecessor, Mr. P. C. Lockwood, since the year 1858, had resulted in the reclamation of 23 acres of land from the sea, which had enabled the Corporation to increase the width of the carriageways and esplanades on the front to their present noble proportions, besides securing the splendid stretch of beach now to be seen. After alluding to the Madeira-road and other improvements on the sea front, Mr. May enumerated the open spaces possessed by the Corporation, and said with regard to Queen's Park situated in the centre of the thickly-populated eastern wing of the town, presented to the town by the Race Stand trustees, that plans had been prepared for its arrangement as a recreation ground and botanical garden, of which the cost was estimated at £4,000. When completed, this, from the undulated and otherwise suitable character of the land, would be the prettiest of all the public recreation grounds of the borough. The Borough Sanatorium and disinfecting station he numbered as one of the most useful institutions in the borough, and pointed to the increase in the mileage of sewers since 1860, from eleven miles to 72¼ miles. He explained the system of drainage, and the intercepting sewer and Portobello outfall. With a view to render baths more attractive and useful, the corporation had decided to try the experiment of a system of cottage baths dotted about in the poorest and more densely-populated districts, thus avoiding long walks to a central large bathing establishment. In conclusion, he said it was not the intention of the corporation to remain satisfied with what had already been done. A public abattoir, a refuse destructor, a grand extension of the sea defences eastwards in the parish of Rottingdean, with suitable drives and promenade, a scheme for the better utilisation of the Tenantry Downs, a yacht station opposite Kemp Town, various street improvements to relieve the congestion of some of the more crowded thoroughfares, and a new town hall were matters already engaging the attention of the corporation.

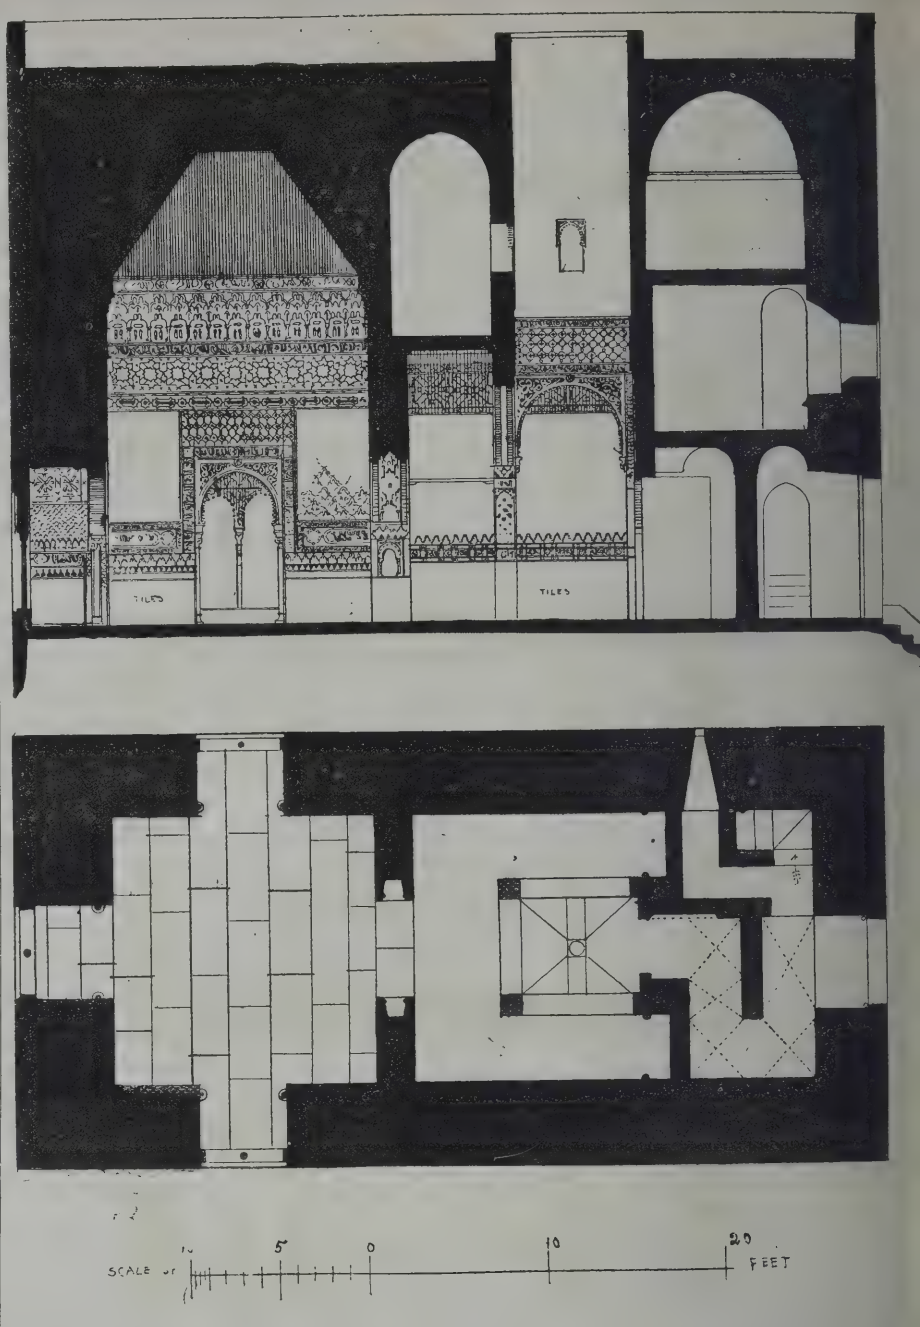
The papers and discussions in the Architectural Section were continued yesterday (Thursday), when a conference of medical officers of health was held in the Pavilion. To-day (Friday) Section III., "Chemistry, Meteorology, and Geology" will be opened by an address from Mr. W. Topley, F.R.S., and a conference of sanitary inspectors will take place. To-morrow evening the congress, which, thus far, has been a success, will be closed by an address to the working classes by Dr. B. W. Richardson, to be given in the Town Hall.

WATER SUPPLY.

THE advantage of having a reserve of water is evident, provided it can be kept from contamination; but how many houses do we find with cisterns exposed to all kinds of contamination, both animal and vegetable, as well as to the negligence and uncleanly habits of servants and the idle pranks of children? We occasionally find the cistern standing on a projecting portion of the offices near to, or right underneath, the upper windows of a house; these receptacles for the stored drinking-water are often uncovered. The lids have become rotten and blown away or removed, and in this condition the cistern remains year after year uncleaned and unattended to. What wonder is it that we hear of the illness of the inmates, of diarrhœa, typhoid, and other complaints? Often the cistern becomes the receptacle for dead rats and mice, cats, birds, leaves, dirty rags, and all kinds of house refuse; a thick sediment of soot and dirt settles at the bottom, and from this cistern the house receives its supply of drinking water. We cannot understand why by-laws have not made it compulsory to place the cistern under cover in a well-ventilated portion of the roof or upper story. Never was a greater madness perpetrated than when house builders placed their cisterns on the roofs or flats of the office range, and the same rule is still followed. Whole rows of houses are seen with their cisterns outside.

The following are a few rules that ought to be made compulsory on builders:—The cistern should be placed in a well ventilated and lighted cupboard or room; the floor, walls, and ceiling rendered impermeable, and, if possible, the room should be free from all vitiated air. The door should be close-fitting. Many plumbers recommend the floor to be lined with sheet lead, 5lb. to the foot, turned up at sides, with a waste-pipe fitted with a flap valve to exclude air. The cistern should be raised above the floor on iron joists to allow of easy access for repair. The overflow pipe should be large enough to allow escape if not led to a flushing tank. The cistern should be made of cast iron or galvanised iron—the former is preferred by some authorities—in which case the Bower-Barff process of preserving the iron can be employed. If lead is used, 7lb. is recommended.

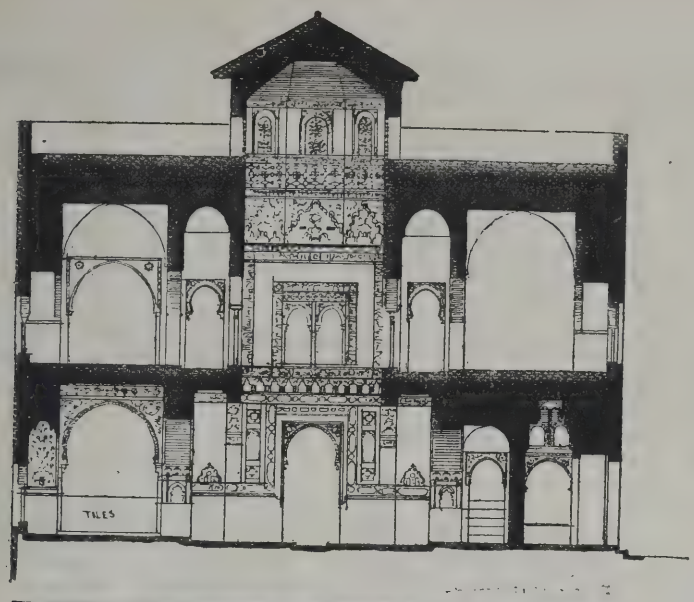
Cleaning tanks every two or three months should be made imperative, and for this purpose the water companies, for their own reputation, should afford every facility in the fittings of the pipes to the bottom of cistern, instead of, as some of them do, placing obstacles in the way. It is extraordinary that water companies have not given more attention to this most important part of their customers' fittings, by preventing the location of cisterns or tanks in any but properly protected and cleanly places.



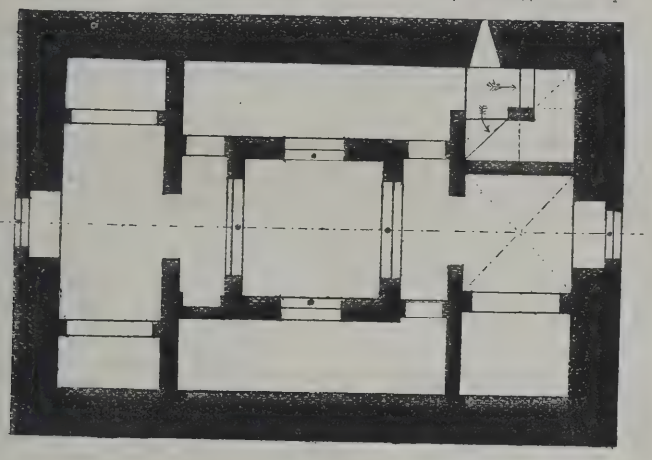
PAVING PRIVATE STREETS.

THE sections of the Public Health Act bearing upon streets and buildings are not so well known as they should be by owners and occupiers of houses. They are Sections 150, 152, 257, 261, 268, 269, and 179. There are a few facts that may be usefully enumerated. That the term "street" is not necessarily a thoroughfare with houses on each side; but simply any road, lane, footway, square, court, or passage, whether a thoroughfare or not, which has been dedicated to the public use by express terms; that the notice be properly drawn up, addressed to the respective owners or occupiers of premises fronting, adjoining, or abutting on the street or road; that the sewer constructed be determined with respect to the street itself, not to the requirements of the neighbourhood; that the levels of the street should be in reference to the street itself, so as to bring it into a suitable condition of uniformity as an isolated street, and not with reference to the levels of other streets. The owners must be given a reasonable time to do the work, and the apportionment of charges should only be made upon the cost of each street separately, and not the cost incurred on a block of streets. Thus it will not be right or fair to add the costs of several streets, and apportion them among the owners of all. The total sum expended may include charge for superintendence. The expenses may be recovered in a summary manner, though sometimes the money is borrowed, and the repayment is spread over a number of years. Under the 179th section of the Act, a disagreement between the authority and owner, about the amount to be borne by the dependent owner, can be referred to arbitration. But the arbitration clause does not allow the question as to the expenses incurred by the authority, being reasonable or otherwise. Generally any aggrieved person can appeal to the Local Government Board.

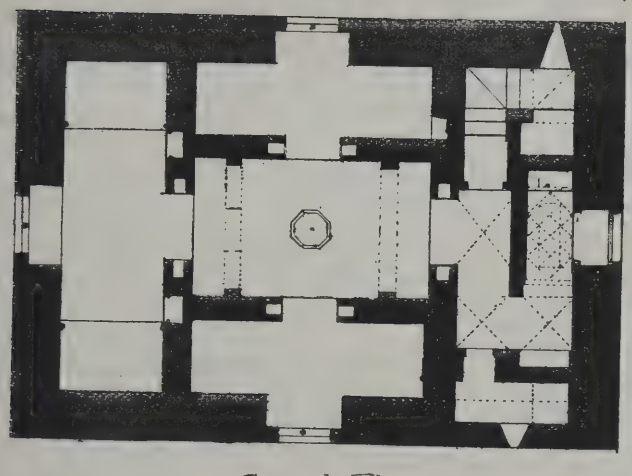
THE CAPTIVE TOWERS OF THE ALHAMBRA.



ALTHOUGH the general appearance of the Alhambra is quite familiar to many of us, and its buildings have often been minutely described by travellers and others, still to an architect visiting this romantic old palace there is a great fascination and charm in examining its various parts, and he is certain to be rewarded with many a lesson in plan and design. The two towers, the Torre Infantas and the Torre Cautiva, do not belong to the Alhambra proper, but are situated on the outer wall, about a stone's-throw from each other, and rise high above the tree-tops on the outer side towards a ravine that divides the fortress from the lands of the Generalife. The Torre de las Infantas, the larger of the two, has a very clever plan, and was designed about the year 1300 for the accommodation of three Moorish princesses, daughters of one of the kings of Granada. It is entered some 50ft. above its foundations from the level ground inside the walls. Facing the door is a screen wall, to keep off the draught, and prevent the curious from peering into the inner court. Above the vestibule is a very pretty Moorish vault in red brick, with interlacing arches; on either side are recesses with seats, where the attendants sat. A door to the left leads into the guard-room, and opposite is a neat little staircase with vaulted roof, leading to the sleeping-rooms above.



The interior of the tower is divided off into small, fairy apartments, beautifully ornamented in the light Arabian style, surrounding a lofty hall, the roof of which rises above the summit of the tower. The walls of the hall are adorned with arabesques and fretwork which sparkled with gold and brilliant colour. The wooden ceiling is modern, but after the original design.



In the centre of the marble pavement is an alabaster fountain that in summer time threw up a jet of water, cooling the whole edifice. Four handsome entrances lead into this inner court, and it may be observed from the plan that each contains two curious little niches, about 3ft. above the floor, probably for holding the shoes of those entering the chambers. The lower part of the walls, to the height of 4ft., is covered with azulejos or porcelain mosaics of various figures and colours. Indeed, every corner of this compact little residence is beautifully arranged and finished. On the first floor the recesses for the beds are separated from the rest of the room by a simple archway. The stair communicates with the flat roof, whence a magnificent panorama presents itself of city and country. Perhaps a few words relating to the princesses who were shut up in this tower by their father, a tyrant king of Granada, may be of interest.

According to Washington Irving, tradition says, as this surly old king was one day riding forth with his courtiers, they met a band of horsemen from the wars with rich spoils and many captives of both sexes, among whom the monarch was struck with the appearance of a beautiful damsel, a Christian. He claimed her as his royal share, and had her conveyed to his harem. With some reluctance she accepted his faith and became his queen, and in process of time the Moorish King was made the happy father of three lovely daughters, all born at a birth. The astrologers predicted that when they came to a marriageable age they would require to be strictly watched. Many years had yet to elapse before the princesses would arrive at that dangerous period, so the monarch had them conveyed to his royal retreat on the Mediterranean. Here they were brought up surrounded by all manner of delights and enjoyments, not being allowed to see anybody but their female slaves. Years rolled on, and the king got warning that the critical period had arrived. What was to be done? He decided to bring them to the Alhambra, where they would be under his own eye. He ordered a tower to be built for their reception and departed to conduct them home in person. But, as fate would have it, on the return journey the princesses got a sight of three Spanish cavaliers of noble birth, who were being brought as prisoners to Granada, and immediately fell in love with them. The king was greatly incensed and had the Christian knights thrown into dungeons and put to hard labour. Finally they were ransomed by their families, but before leaving the Alhambra they formed a plan to carry off the Princesses, whom they had managed to see several times during their imprisonment. So in the dead of night, when the Alhambra was buried in sleep, the three maidens were to descend by a rope ladder from a balcony. The two eldest had alighted safely when the alarm was raised, and the third being timid hesitated and lost her opportunity. The two damsels were hurried to a gate without the walls where the Spanish cavaliers were waiting to receive them. They were placed behind their lovers and the whole party made off across the mountains and reached Cordova in safety. The youngest, whose lover was frantic when he

Ground Plan.

rned she refused to leave, died at an early age, d was buried in a vault beneath the tower cording to rumour.

The Torre de la Cautiva, so called because it s for some time the residence of a fair Christian ncess, who ultimately so bewailed her solitary that she threw herself from one of the ndows and was killed on the rocks below, just the knight who hastened to deliver her came loping down the ravine. The principal mber of this tower possesses some of the best lejos and most delicate ornamentations of the ole Alhambra, and is paved with white rble. Its general proportions are very pleas-, and the whole is surmounted by a noble roof delicately inlaid woodwork forming many star patterns, the colouring of which has long since faded away.

The centre patio is particularly pleasing and quaint and is open to the blue sky above; below the stucco frieze is a plain wall space for the display of rich tapestry; also notice at the entrance a recess in the solid wall to receive the door when open. A tiny staircase leads to the roof and several small apartments overhead.

A. N. Prentice.

At the meeting of the Ystradyfodwg Local Board, on Friday, a letter from the Local Government Board was read sanctioning the proposal of the board to borrow £35,000 for works of sewerage.

THE LATE MR. JULIUS SAX.

We regret to announce the death of Mr. Julius Sax, M.I.C.E., the well-known electrical engineer, at the age of 66 years. Mr. Sax, who died on Thursday in last week at his residence in Great Russell-street, W.C., was born at Sagarre, Russia. He was educated at Konigsburg, and in 1845 was apprenticed to the late Mr. Filby, optical instrument maker at Hamburg. Having served his apprenticeship, he went to Berlin, where he entered the telegraph establishment of Messrs. Siemens and Halske. He came to London in 1851, and worked with Mr. L. Oertling for four years, after which he started in business on his own account for the manufacture of chemical balances and other instruments. Mr. Sax was employed by the late Professor Graham, at that time Master of the Royal Mint, to construct automaton and other balances for use in the Mint. At the Great International Exhibition of 1862 he exhibited bullion and chemical balances, and obtained a prize medal for excellence of workmanship and accuracy. These balances were, by recommendation of Professor Graham, purchased by the Government for the Mint of Hong Kong. In 1863 Mr. Sax turned his attention to domestic telegraphy, &c., and in 1864 took out patents for a metallic fire-alarm button, which would act as an ordinary call as well as a fire alarm; also for indicators to be used with same and for other purposes. Mr. Sax invented and patented in 1869 a form of magneto A B C telegraph; in 1870 an improved mechanical recorder; in 1872 an electric billiard marker; in 1881 an electro-magnetic telephone; an electric water gauge; an electric tell-tale clock for watchmen, with a fire indicator combined; an electric vane; automatic system of electric call-bells for fire stations (exclusively adopted by the Metropolitan Board of Works for all the stations of the Metropolitan Fire Brigade in London); a system of cell calls for police-stations, prisons, &c., as prepared for and adopted by the Commissioners of the Metropolitan Police for use at all stations under their control; also an improved apparatus especially adapted for communicating between drivers and passengers in vehicles, &c. (patented); an electric apparatus for checking cash takings (patented); a perfected form of automatic fire alarm (patented). Mr. Sax has also made several improvements from time to time in electric bells and appliances for various purposes, and has been awarded eight prize medals for excellence of manufacture, &c. Death took place on the 21st of August, at his residence, 108, Great Russell-street, Bloomsbury, London. The business of electrical engineer and electric light contractor will be carried on by his sons, at 7, Ridgmount-street, Store-street, W.C.

CHIPS.

The town council of Swansea came to the decision last week to appoint Messrs. J. Buckley Wilson and Glendinning Moxham as architects for the erection of a new market on the site of the existing Oxford-street Market, the cost, including stalls and all necessary fixtures and fittings, not to exceed £20,000. Messrs. Wilson and Moxham's design, it will be remembered, was selected in the recent competition for this market, and was illustrated in our issue of November 8, 1889, by plan, elevation, and interior view.

The great reservoir which is being constructed at Cardiff, for the Cardiff Corporation, is slowly approaching completion. Mr. J. A. B. Williams is the engineer, and Mr. McKie the contractor. About £47,000 worth of work has been done, the amount of the contract being £83,000.

Corner-stones of a new Primitive Methodist chapel and school in Queen's-road, Halifax, were laid on Saturday. The building has been rendered necessary owing to the sale of the existing school-chapel to a firm of boiler-makers. The cost will be £5,000. The chapel, which has been designed by Mr. James Farrar, of Northgate, Halifax, will be of a Gothic character, fitted with pitch pine, and will accommodate about 500 persons.

The new public buildings at Newcastle-under-Lyme, now nearly ready for opening by the Marchioness of Lorne, have just been embellished by the placing of a clock in the tower, the two dials being at the front and eastern sides. The clock, which has cost £200, has been constructed by Mr. F. Skerrett, of that town, as a memorial to the Turner family. The joint architects are Messrs. Sugden, Son, and Blood, and Chapman and Snape, of Leek and Newcastle; and Mr. J. Gallimore, of Newcastle, is the contractor for the buildings, which will cost £14,000.

CONVALESCENT HOME, LITTLESTONE-ON-SEA—CLEGG HALL, NEAR ROCHDALE.—THE NEW CAMPANILE TO THE CHURCH OF THE HOLY NAME, POONA, INDIA.—HOUSE NEAR GUILDFORD, SURREY, COSTING £750.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES, 1890.—NEW OAK REREDOS, ST. JOHN'S CHURCH, KNOTTY ASH.

Our Illustrations.

CONVALESCENT HOME, LITTLESTONE-ON-SEA.

I HAVE been instructed by the Committee of the Convalescent Home (proposed to be erected at Littlestone-on-Sea, near New Romney, in Kent) to prepare drawings and scheme for the accommodation of 300 patients. The plan explains how the sexes are divided, and the chapel and lower hall effects this. The women have their sewing rooms, laundry, &c., and the men their workshops at either end of the wings. The materials to be used are Kentish rag, with Portland or Stoke Ground stone dressings, and green slate covering to the roofs, fireproof throughout.—PERCY G. STONE.

CLEGG HALL.

CLEGG HALL stands about 2½ miles N.E. of Rochdale. It has a somewhat uncanny look, with its grimy weather-stained gables and stone-spitters. Mills and workmen's cottages have been built near to, and the surroundings are further disfigured by a canal and railway, which pass in front of it. At present it is occupied by several families, the interior having been completely altered. The detail generally is rude, but effective. The central porch is a striking feature, although more curious than beautiful as regards its detail, the columns reminding one of Jacobean bed-posts. The present building belonged to the Asshetons, and was built by them early in the reign of James I. It stands on the site of an older structure belonging to the Cleggs, and, after passing to various families, came into the possession of Joseph Fenton, of Bamford Hall, by whose descendant it is still owned.

THE NEW CAMPANILE TO THE CHURCH OF THE HOLY NAME, POONA, INDIA.

THIS picturesque addition to the Catholic Church at Poona is from the design of Mr. Herbert A. Gribble, A.R.I.B.A., the well-known architect of the Brompton Oratory.

HOUSE NEAR GUILDFORD, SURREY.

THIS house is the steward's residence at Wonersh, near Guildford, Surrey. The requirements were two sitting-rooms, an airy hall and landing, and an office, four bedrooms, bath-room and lavatory, with hot and cold circulating system, kitchen, scullery, larder, and pantry, and a small stable, at a cost of £750, which has not been exceeded. The walls are 11in. thick, hollow tied, with strong wrought and galvanised wall ties. The facings are red brick and the roof of plain red tiles. Messrs. Mitchell Bros., of Shalford, were the contractors, who carried out the works from the designs and specification of Mr. W. Howard Seth-Smith, architect, of London.

SKETCHES FROM OXFORD A.A. EXCURSION.

THIS plate of sketches, by Mr. R. Phené Spiers, F.S.A., is given in connection with the series which have appeared in our pages during the past few weeks (see BUILDING NEWS, Aug. 8, 15, and 22, 1890), in illustration of our account of the Architectural Association excursion in the city and neighbourhood of Oxford. In this account of the buildings visited we have already referred to both the subjects represented herewith to-day. The first shows the vaulting of the choir of Christ Church Cathedral, which Cardinal Wolsey erected over the arcade. The view is taken looking east, showing also the rose window over the high altar. The doorway delineated on the second half of the plate is from St. John's College, and the sketch shows it from the Quad side under the piazza. This wing, which Inigo Jones built, to St. John's is an exceedingly refined and skilful design, quite the best example of Renaissance work in Oxford. The doorway leads from the inner quadrangle to the gardens, and on both sides the treatment of the opening with its architrave and pediment is the same. Some measured drawings of this building would be welcomed.

REREDOS AT KNOTTY ASH CHURCH.

THE Church of St. John the Evangelist, at Knotty Ash, a few miles from Liverpool, was an edifice of few architectural pretensions until recently, when the designing of a new chancel was placed in the hands of Messrs. Aldridge and Deacon, architects, of Central Buildings, North John-street, Liverpool. The additions, which are reputed to be exceptionally successful, were consecrated last April. The reredos we illustrate to-day occupies the space below the window at the eastern end of the chancel. It is made entirely of oak, and is 20ft. wide. It is conceived by the architects simply as a background for the ornaments it is to hold. It was made by Mr. Harry Hems, of Exeter, who also carried out the screens and pulpit in the same church. Messrs. Aldridge and Deacon have designed some oak fittings for the chapel in the south chancel aisle, which Mr. Hems is at present making, and of these we may, perhaps, give an illustration later on.

The great west window of St. Mary's, Oxford, is to be filled with stained glass, as a memorial of Dean Burgon, who was vicar of the parish for 13 years before his appointment to the Deanery of Chichester. Mr. C. E. Kempe, of Pembroke College, is the designer of the window. The subject is a "Jesse tree," with the figures of the four Evangelists in the lower lights, and also the arms of the 21 existing colleges in the University. The figures of those saints who are associated with the history of St. Mary's are to be introduced in the tracery of the window, and also the heraldic shields of several benefactors of the Diocese of Oxford, of the University, of Oriel College, and of Dean Burgon himself.

The annual inspection of the parks by the Glasgow Town Council took place on Wednesday, when the inaugurations occurred of the new drive in Kelvingrove Park by Lord Provost Muir, of the Doulton Fountain, Glasgow-green, by Sir Henry Doulton (by whose firm the fountain, which was one of the chief features in the Exhibition grounds last year, has been presented), and of the Steven Fountain, Cathedral-square, by Hugh Steven.

Two memorial windows have been placed in the north transept of Girvan Parish Church to commemorate the ministry of the late Rev. William Corson. The windows are the workmanship of Messrs. Ballantine and Son, Edinburgh. They represent "The Baptist's testimony to Jesus: Behold the Lamb of God," and Christ's address to Peter, "Feed my Sheep."

The contractors for the preliminary excavations for the Coatbridge Town Hall and Municipal Buildings began operations on Monday. The site has been presented to the burgh, and the buildings, which have been designed by Mr. Mitchell, the Burgh Master of Works, are to cost about £20,000. The site is adjacent to the Coatbridge public school and the new Technical School and Mining College, the memorial-stone of the latter of which is to be laid by Sir Archibald Campbell early next month.

A fine bas-relief was recently brought to light while some workmen were busy excavating the Via dei Crociferi, Rome, for the purpose of building a drain. It was of white marble, and represents a horse, on which is seated a female figure supposed to represent Victory. Another discovery has been made in the Piazza del Duomo at Verona. It is a tree in marble, having on one of its branches in Greek letters the words, "*Praxiteles epoiese.*"

The schools at Bagby, near Thirsk, which are at present much too small and dilapidated, are to be pulled down, and new ones erected, with master's house, &c. Messrs. W. Lewis and Son, of York, have been instructed to prepare plans.

COMPETITIONS.

OLDLAND, NEAR BRISTOL.—The School Board of this district propose to build a school at Cadbury Heath, near Warmley, for 300 children, and the 29th of September is the day for sending in plans. The official circular of instructions, signed by A. Ladd, who acts as Clerk to the Board, is a curious composition to issue from a body of educationalists. It states, for example, that "the Board do not *accept* any liability in asking for these plans. The architects must take all the risks of plans being accepted or not." It is comforting to know that "architects are to find their own levels." The final clause says: "The best-planned school, simple, not elaborate, is desired, to be built of Pennant stone, with freestone dressing and *Roman Tiles.*"

CHIPS.

The list of adjudications in bankruptcy in Friday's *Gazette* includes the names of Charles Henry Burstow, Horsham and Horley, in partnership with E. Burstow, under the style of E. and C. H. Burstow, architect and surveyor, and William Harries Tamlyn, Cardigan, land surveyor, inspector of nuisances, and highway and borough surveyor.

The Wigan corporation have appointed Mr. A. Taylor, at present inspector of nuisances to the Wallasey local board, to succeed Mr. J. R. Leggatt, who has been elected chief sanitary inspector to the vestry of St. Mary, Islington, N.

The will and codicil of Mr. Robert William Mylne, F.R.S., F.R.I.B.A., late of 7, Whitehall-place, and of Great Amwell, Herts, who died on July 2, were proved on the 12th inst., the value of the personal estate amounting to £3,686.

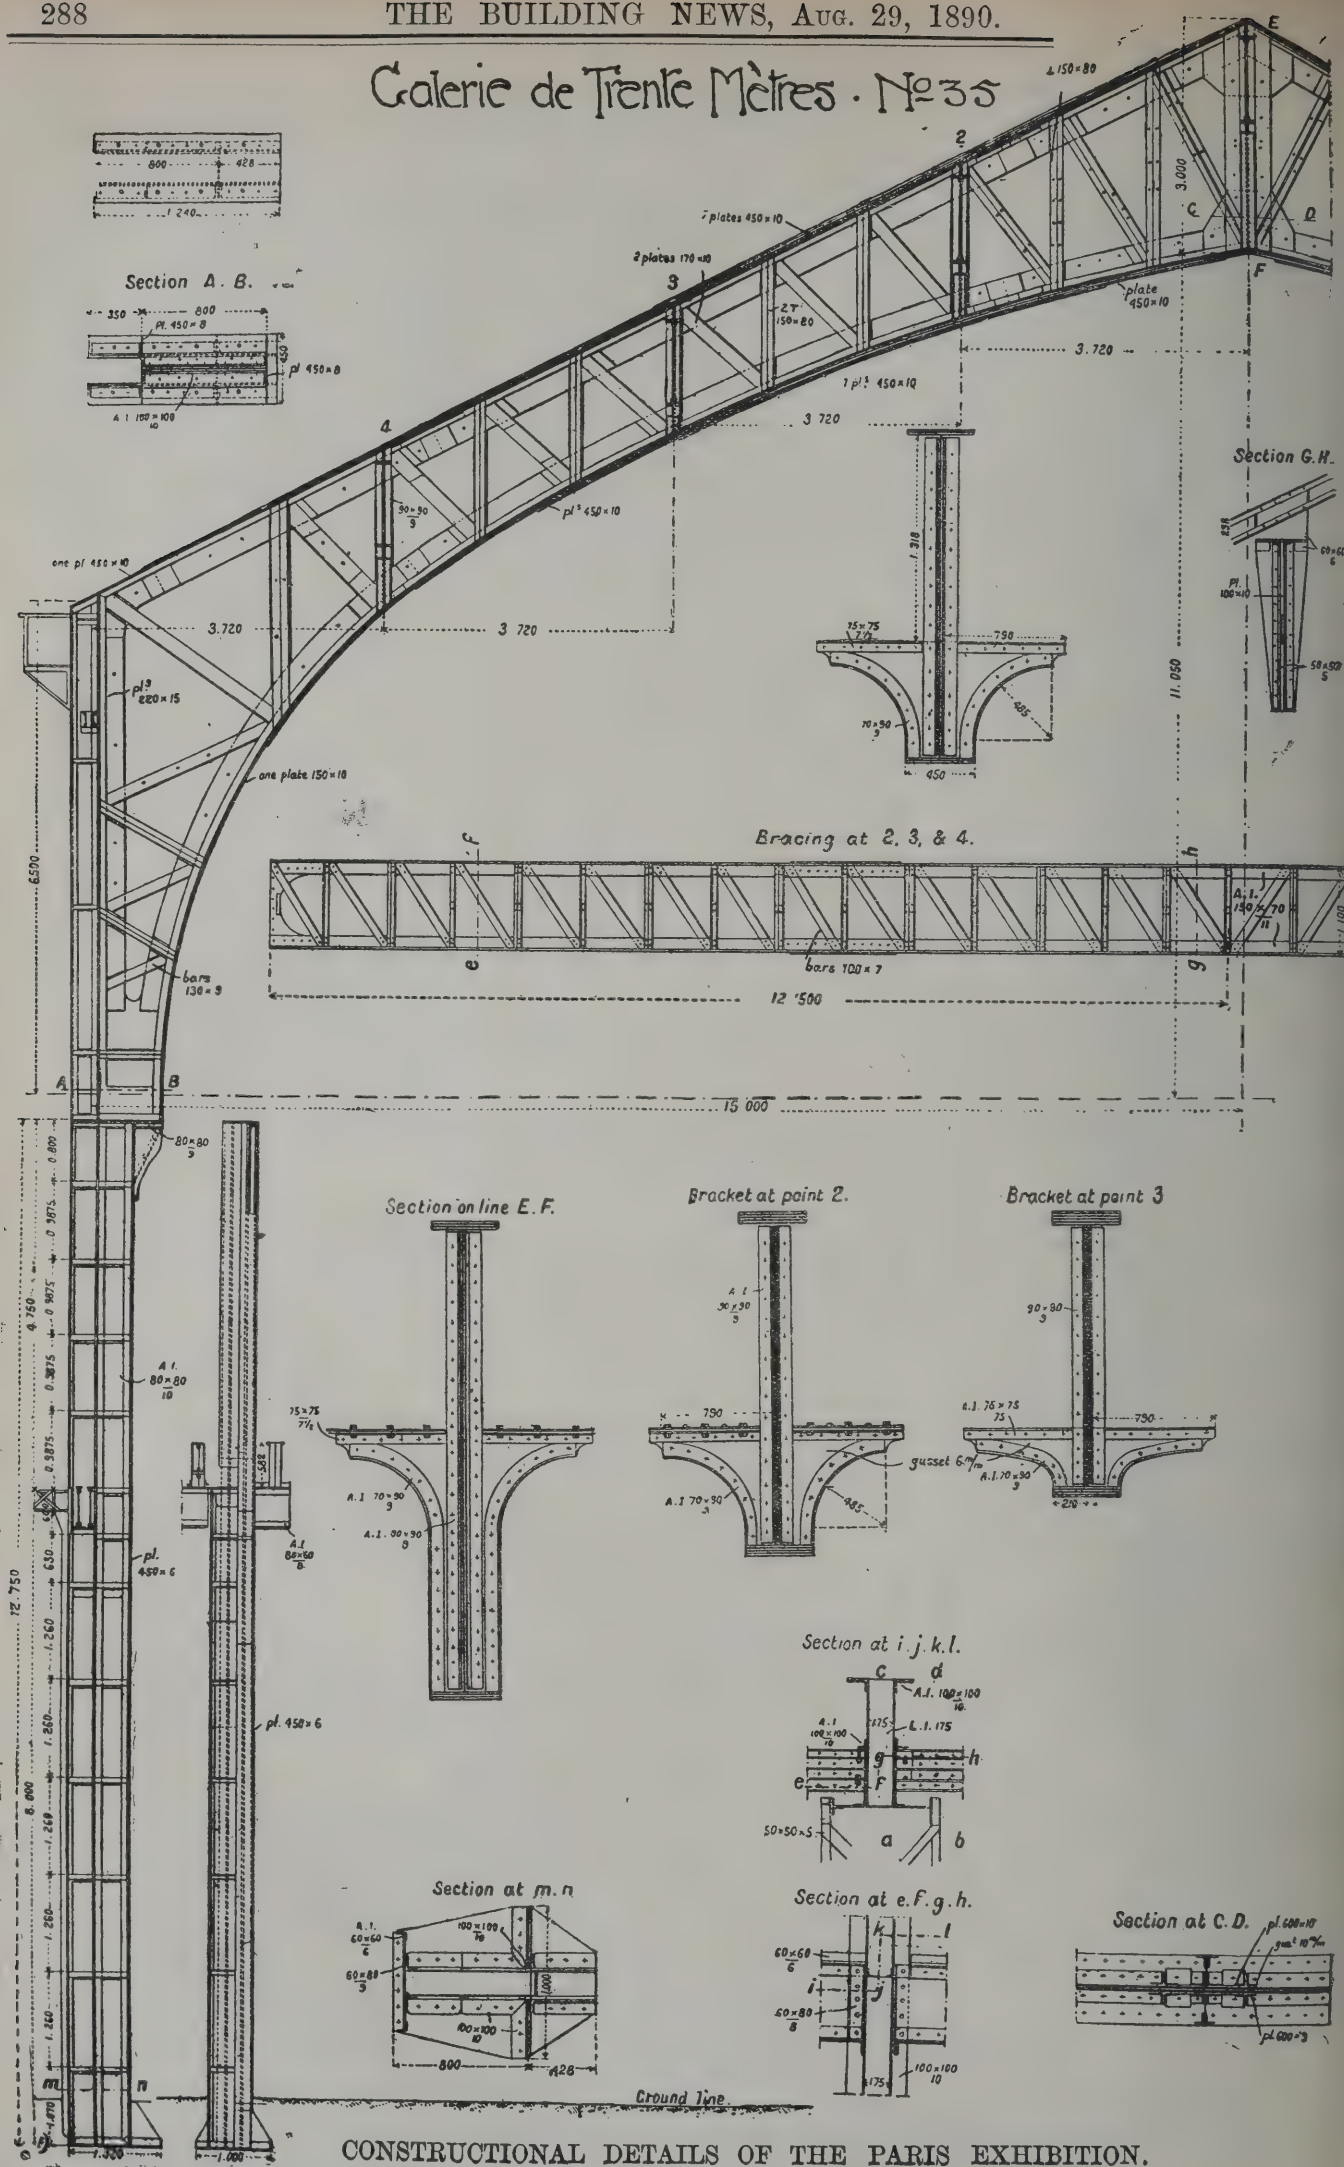
Mr. Goodwin S. Packer, architect, of Southport, has been instructed to carry out alterations consisting of new drying houses at Messrs. Butterwith and Hunter's warehouse, Bootle. Messrs. G. Wood and Son, of Bootle, are the contractors.

The sudden death occurred on Wednesday of Professor Carnelley, Professor of Chemistry in Aberdeen University. Mr. Carnelley, who was only 38 years of age, was educated at King's College School, London; Owens College, Manchester; and at Bonn. In 1879 he was elected to the professorship of chemistry in Firth College, Sheffield, and in 1882 to the chair of chemistry in University College Dundee. Two years ago he was called to the chemistry chair in Aberbeen, and already had attained eminent distinction in that town. He will be best known to our readers by his investigations into the contamination of the air in public buildings.

The Cambrian Archæological Association has decided to hold next year's meeting at Killarney, Ireland.

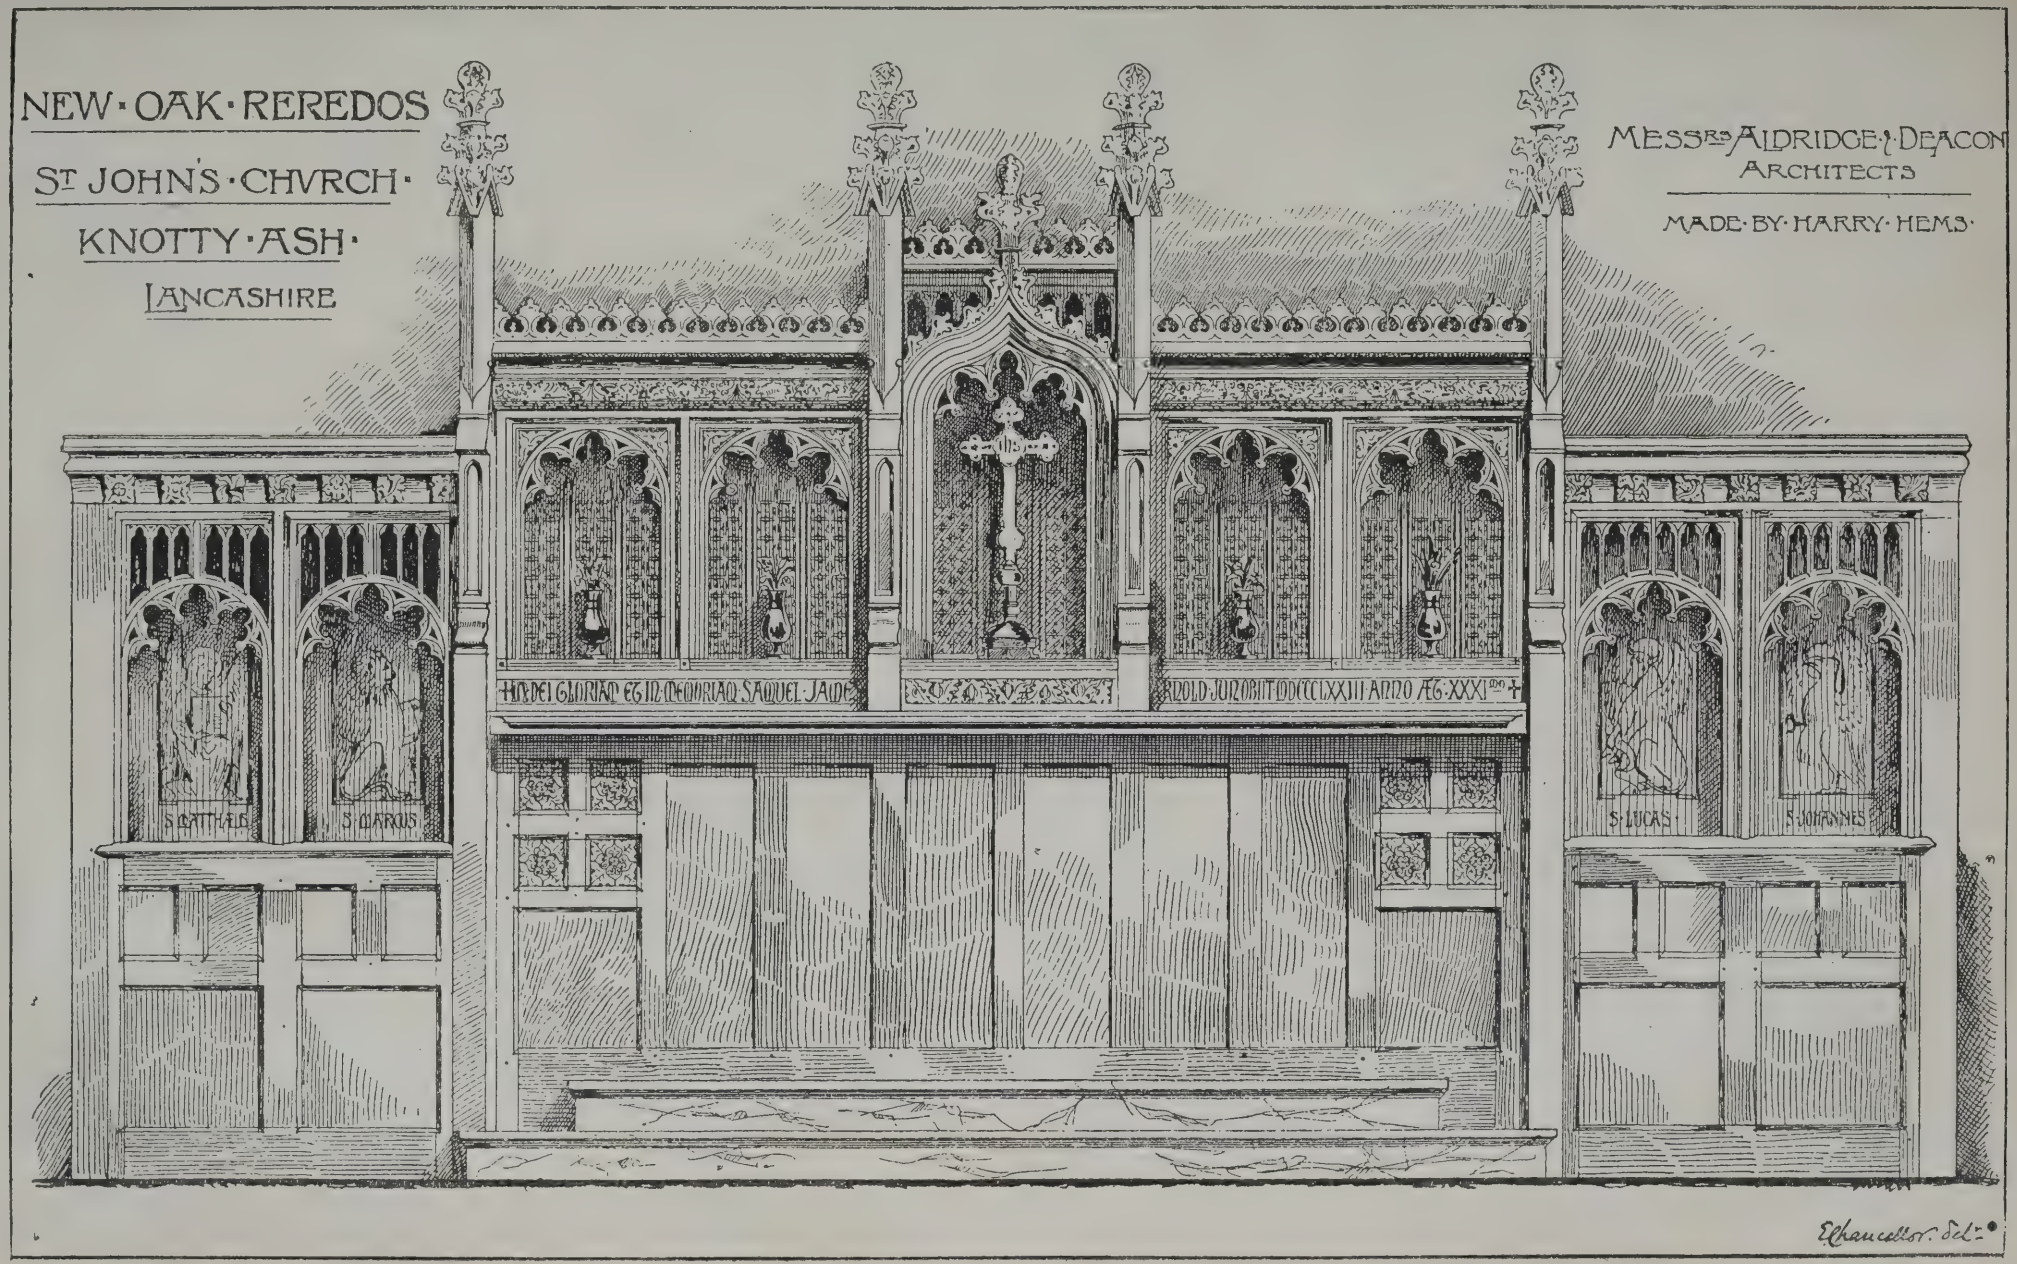
Mountnessing Church, near Ingatestone, Essex, was reopened last week, after restoration at a cost of £2,000.

The memorial stones of New Primitive Methodist chapel and schools at Redditch were laid on Monday last. Mr. Matthew J. Butcher, of Birmingham, is the architect, and Messrs. C. G. Hinns and Sons, of Redditch, are the builders.



Mr. Richard D. Batchelor, the artesian well engineer, of Chatham, has over 60 wells and borings in hand. He has just obtained the contract for the well at the Sheppey Portland Cement Works, Queenborough, and the well and bore-hole for the East Surrey Water Company at their pumping station, Kenley.

In the case of Edward Brown, of Liverpool-street, City, and Vicar-terrace, Forest-gate, late of Harbury-street, Spitalfields, and Bow-road, E., who combined the professions and trade of architect and surveyor and licensed victualler, the discharge has been suspended for three weeks, from July 30, 1890.



A temple of the Inca period has been discovered at Yurimaguas, at the foot of the Eastern Cordilleras, in Peru. It had an inclosing wall 80in. thick, the inclosure within being divided by other walls into halls and smaller chambers. The plan and the painted inscriptions resemble what have been found in other places ascertained to be ancient Peruvian temples. The Peruvian Government has, as a consequence of this discovery, resolved to undertake regular excavations on sites where temples existed prior to the conquest.

The Haslingden local board have invited four Manchester architects to compete for the building at the new cemetery at Clodd, the outlay not to exceed £2,500.

Mr. Barron, C.E., Wick, has been surveying the harbour at Stonehaven, with a view to its improvement and extension. A plan has been submitted to the harbour board showing the improvements and additions desirable, the cost of which is estimated at £15,000.

WAYSIDE NOTES.

IE Morley Town Council have fulfilled all our anticipations, and placed their compe- before the profession. Reading the ad- sement, I feel doubly sure as to the result— r, at least, as regards the number entering struggle. The competitors are allowed e time, the "entrance fee" is small, and a er premium of £25 has been included over above the two we expected; all of which s that architects will swarm round them flies round a treacle-jar, only with less inty of tasting the sweets.

mpetitors will please to remember some in November. The later weeks of the h of fogs and other winter urban joys will these gentlemen busy. The municipal ing-house designs go in on or before the , the Morley plans on the 21st, and the ntry Baths on the 30th. Those for the re- truction of Buckingham Palace, and for the ion of a skittle-alley at Burlington House be in exactly on Nov. 31. These dates ld be borne in mind by the double-barrelled petitor who goes in two competitions at a , and who should reflect that, although bundance of days are allowed for the com- ions named, the amount of draughtsmanship ired in each case is likely to be considerable.

here is a building, lately completed, that has ed a more than ordinary impression of archi- ural magnificence upon the public mind. I r to the Portsmouth Town Hall. Speaking he proposed building at Morley, I am re- led of this one, and how it has been extolled by public press. Of its present completed aspect not competent to speak, excepting by virtue rtain illustrations that have been published. en last at Portsmouth, I remember this build- was not so far advanced as to have its first in position, and, although I then curiously mined the work executed, and, after much -craning and peering through cracks and ings in the hoardings, &c., managed to get e idea of the intentions of its designer, I e no authority to criticise it as it now ds. That business I have left to my ers, who mostly, I notice, regard the k with an air of condescending superiority, encourage youthful conceit to turn up its at orders of columns and simply quarried sic details, and to think of velvet coats and le glass, and sigh. Now I must confess to a et enjoyment when I see people's noses put of joint at the sight of honest Classical mns, with none of the thunder-and-lightning inality—no aldermanic belly for entasis, and gouty base or bloated capital; and I am well sed to find another building completed, the neter of whose columns bears some sort of tion to their height. I take it always as a ht antidote to the disease of originality-at- -price that holds us at this day, and at times atens to develop to an alarming crisis.

Ve must return for a bit to sanitary matters, ng that the Sanitary Institute is now well er way with its Brighton Congress. I am at es inclined to think that it is with sanitation t is with many other matters in this world, and t is that we know a lot about its principles, do not fail for lack of scientific knowledge, rather because the machinery for enforcing observance of healthy practices, &c., is not ffective in working as it might be. In the e of jerry-building, we should not profit reat deal from congresses on the subject so g as the law allowed the evil to continue. I thinking now of an incident at Milton-next- ingbourne, the facts of which appeared in papers early this week. They are too long give *in extenso* here; but, broadly speaking, y relate to a nuisance caused by "immense osits of offensive manure" brought by barges, allowed to lie on the wharf for weeks ether. So far as the ordinary reader can ke out, the responsibility for the nuisance thus ated was not easily placed on the shoulders of party or parties, feebleness of action cha- terising the whole matter; and when at last Milton Board of Improvement Commissioners to take action they complained of the task. w it appears to me that if the laws—bye or erwise—had been effective, the nuisance could er have occurred. Having been shown to e been otherwise, similar things may occur again in spite of sanitary congresses. Sanitary laws and regulations enforced with more rigour are what is required.

The split in the sanitation camp was very much in evidence at Brighton on Tuesday. Dr. G. Vivian Poore, President of Section I, devoted to sanitary science and preventive medicine, delivered an address on the "Living Earth," advocating the direct earth system of sewage disposal. At the conclusion of the address, Sir Douglas Galton objected to the principles enunciated, and advocated drainage into water. The public didn't profit much by this. It is an old saying about the differences of doctors, and here we have an example of it. The fact is that in neither the water nor earth systems has a true solution yet been found of the problem of the sewage disposal of large cities. Foulness is apparent in either case—in the former in rivers and streams, in the latter in the air; for so far I have never met with a so-called sewage farm but what it filled the air for wide districts with a pestilential odour. The Thames, the Liffey, the Clyde, the Mersey, and the Irwell, on the other hand, are, as Dr. Poore pointed out, standing testimony to the shortcomings—to use a mild term—of the water-drainage method. There is therefore much cause for disagreement between even specialists as to the best practical and theoretical systems for the sewage disposal of large cities; but as so much attention and study is now being directed to the question, we may yet hope for some solution of the problem, when, we may hope, we shall not be compelled to talk about it so frequently.

The first meeting of the members of the Commission appointed by the County Purposes Committee of the Corporation of the City of London to inquire into the sources of the water supply of Manchester and Glasgow, with a view to purchasing or placing under a public trust the water supply of London, was held on Tuesday in the Glasgow City Chambers. In the examination of Mr. J. M. Gale, the engineer to the Glasgow Water Commissioners, I was surprised to see it stated as a misfortune that in general the Scotch citizens and townsfolk use more water per head per diem than the English people generally. As an instance of the *reckless* use of water in Glasgow, Mr. Gale stated that even in the small houses in Glasgow—houses of £10 and £12—there were baths, shower as well as plunge. In this part of Great Britain we should many of us rejoice to think that people renting such humble tenements had such a wholesome liking of cold water. Perhaps Mr. Gale would like a few companies of the host of the Great Unwashed from our own city, in exchange for the reckless Glasgow householders with their wasteful shower and plunge-baths? We should be well enough satisfied with the bargain, being prone to indulge in fancies that a fondness for ablutions goes hand-in-hand with moral progress and physical development. The Glasgow Water Commissioners would save by the exchange, and thus be able to effect that reduction in the consumption of water for domestic purposes in that city for which they once strove and ignominiously failed—a fate deserved by so barbarous and unenlightened an endeavour. As regards the rest of the happenings at the meeting in the Glasgow City Chambers, I don't think that the commissioners will have learned much other than that Glasgow enjoys an unpolluted source of water supply in Lochs Katrine and Gorbal, and that similar advantages would be an immense boon to Londoners now drinking semi-purified Lea and Thames waters.

Bumbleism is up in arms at the idea of reforms that may follow the conception of a satisfactory scheme of London District Councils. Believing that a scheme for the establishment of district councils has been formulated by a sub-committee of the Local Government and Taxation Committee of the London County Council, proposing extensive alterations in the present administrative areas of Metropolitan local government—believing, and doubtless feeling in heart, that at last a blow may be aimed at the scandals and petty squabblings that have rendered it famous in history, Vestrydom has risen in a panic, and hastily delegated and memoralised the Prime Minister. It trembles for its life, and, I may hope, with some reason. When Mr. Ritchie first suggested the district councils it was to rid the city of the burden and annoyance of its vestries, and to supplant the butchers, bakers, and candlestick-makers with persons more qualified to carry on local government. This I hope and trust it may do, and just as the Metropolitan Board of Works was ruthlessly swept away to make room for the County Council, so should the vestries be wiped out of existence, and their places taken by an entirely new organisation, even if the ratepayers do have to expend that money—which in their memorial the vestries so tearfully deplore—on new buildings for municipal duties.

The memorial contains little in the way of useful suggestion as to the arrangement of the district councils, but it contains a clause, subheaded (*b*) to the effect "that the office and functions of the district surveyor, under the Building Acts, should be in the hands of the local Boards and their officers, with an appeal to the London County Council." In its dying struggles Vestrydom clutches at the district surveyor! How it would have liked years ago to have got him under its thumb, and to have reduced the honoured official to a mere uniformed and salaried Tom Pinch-like drudge! The fees of the hard-worked district surveyor have long been coveted by Mr. Bumble. Hear what he says in the memorial:—"With regard to the transfer of the office and functions of district surveyor under the Building Acts . . . the district surveyors of the local authorities are paid by salary—*a more convenient and satisfactory arrangement.*" The appeal is almost pathetic; but it is all in vain. The district surveyor has served the public, who have found no fault in him. With the Vestry it is long disgusted—disgusted with the petty scenes and squabbles that are periodically reported in the press, and served up as light recreative literature along with extracts from *Punch* and *Fun*. The vestries have destroyed themselves, like the Kilkenny cats, and nothing now remains but to clear the ground for a system of local government on entirely re-modelled lines. GOTH.

CHIPS.

Memorial stones of a new Wesleyan Chapel were laid at Duddin, Cheshire, last week. The building will be of brick and stone, with pitch-pine fittings, and will seat 200 persons. Mr. J. Wynne, of Manchester, is the architect, and Messrs. George Wright and Sons, of Kelsall, are the contractors; the cost will be £700.

Professor Wilhelm Gentz, of Berlin, a well-known painter of Oriental life and nature, has just died in his sixty-eighth year. He was a pupil of Klöber's, and from 1845 to 1852 pursued his studies at Antwerp and Paris, afterwards travelling in Spain, Morocco, Egypt, and Turkey. His masterpiece is the painting of the entry of the then German Crown Prince, the late Emperor Frederick, into Jerusalem, in 1869. It appeared in 1876, and was soon afterwards bought by the Berlin National Gallery.

While one of the workmen engaged in the construction of the ladies' vestry on the east side of the north transept of St. Giles' Cathedral, Edinburgh, was demolishing part of the roof of an existing apartment, he found an upper right-arm bone lying on the top of a lath-and-plaster ceiling. It is conjectured that this is the famous arm of the patron saint, till the Reformation, the most precious relic of the church.

At the Theatre Royal, South Shields, on Monday, Mr. William Newman, head carpenter, while arranging scenery at the top of the building, fell to the stage below, a distance of 40ft., and was instantly killed. The deceased was 36 years of age.

Mr. J. S. Pickering has been appointed engineer and surveyor to the local board of Nuneaton, out of 80 applicants for the office, at a salary of £150 per annum. Mr. Pickering is allowed to retain his present appointment as manager of the East Warwickshire waterworks.

The Bournemouth direct line has caused a very large increase in the amount of traffic to Brockenhurst station, and a turn-table and additional siding accommodation have just been provided at that junction. The work has been carried out under the superintendence of Mr. Baines, of Ringwood, the district superintendent of works and ways, and Mr. E. Wilcox, the permanent way and works inspector. Messrs. Mowlem were the contractors. —An entirely new water supply has been provided for the town. A well has been sunk, over 40ft. deep and 9ft. in diameter, and a tank capable holding 18,000 gallons has been erected, a steam-pump being employed to raise the water.

THE SOCIETY OF ARCHITECTS' SUMMER EXCURSION.

ON Monday morning last the most successful excursion yet undertaken by the Society of Architects was commenced under the leadership of the President, Mr. Robert Walker, A.M.Inst.C.E., of Cork. The county selected this year has been Kent, and an itinerary tour has been arranged in preference to the plan formerly adopted of selecting a centre and making daily excursions thence, and the result so far has been most satisfactory, the full and interesting programme attracting a large attendance, and even the weather—fickle as it has been of late—having proved just such, with its clear lights and changing shadows, as to add charm to what was already enjoyable.

The party first met outside the richly-carved Norman doorway of Rochester Cathedral,* and were there met by Mr. George Payne, F.S.A., hon. secretary of the Kent Archæological Society. He conducted them across the Norman nave into the Lady-chapel—built in the south-west corner between the main south transept and the south aisle—and there he read the chronological table, prepared by Mr. W. H. St. John Hope, M.A. (assistant secretary of the Society of Antiquaries), who was himself to have conducted the members, but who was prevented from doing so at the last moment. Mr Payne, however, proved a most efficient guide and substitute, showing how the cathedral grew, and pointing out the various tombs and monuments. One tomb in particular he drew attention to as having been found in the Saxon graveyard, and illustrating the very earliest form of Christian burial, when coffins were formed of stone slabs, in the place of the body being covered with a mere tumulus or heap of unwrought stones, and before the hewn sarcophagus was formed. This tomb is now placed in the chancel of the cathedral. Afterwards Mr. Payne drew the members after him to the crypt, and they were greatly interested in the Late vaulting, evidently introduced in order to strengthen the original Norman work. The last portion inspected was the new work upon the choir screen, now being carried out under the direction of Mr. J. L. Pearson, R.A., and then the party entered the picturesque garden of the Deanery, and were photographed in front of a background of Norman walling, and a fine Norman door.

After lunch, which was kindly provided by Mr. J. O. Moore, the Mayor of Rochester, the well-known Elizabethan house, known as Restoration House, was visited. Here the members were met by the owner, Mr. S. T. Aveling, who acted as guide for the remainder of the day. His own house was full of interest, with its E-shaped plan, in quaint compliment to the reigning Queen, its picturesque and comfortably-arranged double staircase, of timber with wood panelled ceiling, and its wealth of curious detail, lovingly restored to its former place and use by the present owner, who has taken pride in his house, and his done his best to discount the effects of the vandalism of his predecessors. One of the rooms, that in which Charles II. is said to have slept just prior to his Restoration (from which event the house obtains its name), has been surrounded by a series of wall paintings executed with care and delicacy, though in a style which reminds one of an earlier date than that of the house itself, by its present owner.

Rochester Castle, which was next visited, is well-known, and has been described; but its bold keep and picturesque arcade which, at the first-floor level runs lengthwise along the centre, with its strong Norman tiles and zig-zag mouldings, could never have looked much better than upon this bright afternoon. The members stayed there long, lingering over the hoary walls and admiring the views obtained therefrom, while the more critical noted the construction of the stairs, exposed to view by the removal of the finished slabs, marking how the centring for them must have been made, the marks of the timber laggings being plainly visible, and observed how the portcullis was worked from the chapel above.

Eastgate House, which was the last place inspected that day, dates back to 1590, and is a rambling, picturesque old timber dwelling, with bay windows, rich Jacobean over-mantels, and boldly plastered ceilings in wonderful preservation, especially considering that it is at present used as a labourers' club. In its panelling the gradual development of the mitred joint can be traced, the earlier form, when the mouldings on the solid were but worked off without any attempt to form an angle joint, being evident on the ground and first floor, while upon the two upper floors, evidently panelled at a later date, and in the still later over-mantels, were seen the first rude attempts, and then the finished mitre. To the ladies who were with the party, though, the greatest interest lay in its connection with the late Charles Dickens, and tracing in it the Ladies' Seminary of the "Pickwick Papers," and the Nuns' House of "Edwin Drood."

At tea, the party, which now numbered half a hundred, were entertained at the King's Head Hotel by Mr. G. E. Bond, a local member, and afterwards they journeyed on to Maidstone, to sleep there in preparation for their next day's work.

Tuesday commenced with a visit to the Museum at Maidstone,* where the members were met again by Mr. Payne. Leading them into the picturesque old brick and timber building, which, dating back to 1540, is now being enlarged to meet the requirements of one of the largest provincial museums, under the direction of Mr. H. Bensted, F.R.I.B.A., he described to them the fine collection of antiquities stored there. He pointed out particularly two leaden coffins of Roman date, with bold stamped ornaments upon them, and some Roman roof tiles of much the same pattern as that adopted in recent years by the Broomhall Company. The examples of various descriptions of early Kentish pottery were scarcely of architectural interest, though of archæological value; and the same remark applies to most of the objects in the private collection of the Kent Archæological Society, which was thrown open for inspection. It is a most representative collection of Anglo-Saxon relics, however, and the members were much interested in the description of the weapons, armour, and ornaments found in Anglo-Saxon tombs. Amongst the things found was almost invariably a bucket at the feet of the deceased, and Mr. Payne facetiously derived the common expression, "to kick the bucket," from this ancient custom. The fine-art collection, including some pictures by Sir Peter Lely, and the naturalistic galleries were described by the curator, Mr. Bartlett, and then the members put themselves under the guidance of the Rev. Cave-Browne to be conducted over All Saints' Church.† His description of this handsome building was exceedingly full and interesting, although he differed from most authorities in ascribing the nave to an earlier date than the chancel. The President, and most present, thought him to be mistaken, for not only the general feeling, but every detail, coincides throughout, and Perpendicular work, even of the bold type exhibited, is rarely met with at an earlier date than 1395, when Archbishop Courtney is known to have built the chancel. Mr. Browne's reference to the slightly different orientation of the former edifice from that of the present church, as shown by the positions of the bases of more ancient nave piers which have been found below the present floor, led to an interesting short discussion, and the difference was generally ascribed to the different times of year at which the two edifices were orientated, the line having most probably been set out at six in the morning upon the patron saint's day, and the past and present churches having had different patrons. Attention was called to the matrices of two fine brasses, both originally upon altar tombs, and to a sedilia of four seats upon the same level.

After lunch, partaken of at the Star Hotel, brakes arrived to convey the party to Leeds Castle; but, unfortunately, soon after it was reached, rain began to descend, and the best, the untouched external portion, of this once important and famous castle could scarcely be inspected. Standing upon three islands, in the midst of a wide mote, originally with drawbridges between the islands, it must have been well-nigh impregnable before the introduction of fire arms. Though the chapel windows are fine specimens of the Late 13th-century tracery, some parts of the building are said to be still, yet most of the original work is of Tudor period. The best view is that obta from the approach when the Castle is seen a the moat, and its three parts stand out b against the sky; but the interior is disapp ing, and much valuable time was lost i inspection. As a result, even the unique le at Detling Church,* which was next vis received scant attention, and the invitation o vicar, the Rev. J. Cave-Browne, to after tea had most reluctantly to be declined. It still raining when the party returned to M stone, where they had tea, and whence subsequently proceeded by train to Tonbri where those who had not taken the precauti secure beds some days in advance were compe to find lodgings as best they could, for the h had been filled by the unusual influx of visit

Wednesday morning opened fair, and man the more enthusiastic began the day wit couple of hours' sketching in Tunbridge be breakfast. This partaken of, brakes come ro and a most beautiful drive was undert through some of the best scenery in the fe county of Kent, and visitors from dis counties were no less delighted with the s farmsteads and cottages, almost all well desig than with the ever-changing views. Bidboro Church was reached about 11 o'clock, and Rector, the Rev. H. C. Elliss, received the p there, conducting them over his pretty l church. This, he said, was of many diffe dates, a portion of the north wall being ascri to the beginning of the 11th century, while south wall is Norman also, the northern arc Transitional, and the tower is a solid struct erected in the 15th century. It was restore 1876 by Mr. Ewan Christian.

Before proceeding, a few moments were sp in inspecting a half-timbered farmhouse, restored, and of more than usually pictures outline, with some good detail in it; and t the drive was continued to Penshurst Place,† seat of Lord De L'Isle and Dudley. The sight of the village, with its church and "Place" in close proximity, and several ha timbered houses near, the whole nestling u the slope of a hill amidst luxuriant foliage, most picturesque. But it scarcely prepared members for the sight which met their vi when, having left the brakes and passed throu the churchyard, they came in view of the gr house, with its many-gabled ends, twis chimneys, and windows of many different da —although it was evident that the greater p of the building was erected in the 15th centu a few details having been altered during t building epoch of Elizabeth's reign. T banqueting-hall, with its slightly-raised dais one end, and musicians' gallery of richl panelled oak at the other, to say nothing of open-timber roof, is exceptionally fine and w preserved, while the winding staircase leadi from it to the ballroom, lighted by 14th-centu traceried windows, is eminently picturesq Thence the party was conducted, by special pe mission, through many rooms and galleries, co taining tapestry, pictures, armour, and cabin of remarkable interest and value, and finally in the cellars beneath the banqueting-hall, t vaulting of which dates from the reign of Edwa III., and it is noticeable by the ribs springi directly from the octagonal central colu without the intervention of any capit From all points of the building sketch and photographs were taken, and then again t party collected and drove on, until the village Chiddingstone was reached. It consists of b half-a-dozen houses and a church; but they ma up for being few in number by their extraord nary beauty, all dating from the end of the 17 century, and being of half-timbered constructio Here lunch was partaken of, and then again t sketch-books came out, every detail in the pla being, one would imagine, noted during the ne hour, if one could judge by the enthusiasm a industry displayed. To see this village alone worth a long journey, for to see it is in itself education into the mode of living of our for fathers. The sketch-books, however, were n even yet allowed to rest, for Hever Castle, th former residence of Anne Boleyn, was ne visited, and the party conducted over it by i

* The following illustrations of Rochester have appeared in the BUILDING NEWS:—Sketches by Leonard Martin, May 16, 1890; Cathedral, west doorway, June 24, 1870 (double-page plate in Sketch-book Series), and March 1, 1889; new stalls by J. P. Seddon, Oct. 29, 1880; Castle interior, Feb. 11, 1870; Eastgate House, Sept. 30, 1881 (clubroom, by H. O. Cresswell), Aug. 6, 1886.

* Illustrated in the BUILDING NEWS for Feb. 23, 1877; staircase, Jan. 11, 1878; overmantel (measured details by E. H. Dance), July 13, 1883.

† See illustration in the BUILDING NEWS for Aug. 20, 1881.

* Sketched in the BUILDING NEWS for April 15, 188 and Feb. 8, 1884.

Mr. E. Heard. Here, again, was a wealth h-century detail to be studied, the fine ay, with its portcullis and gate complete, still intact; but, of course, the ancient ridge across the moat has given place to a olid modern structure.

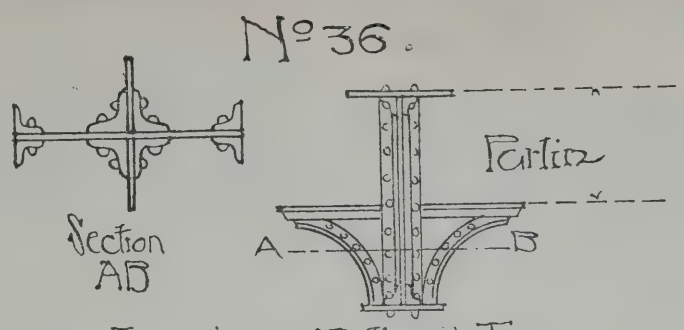
n the drive back to Tunbridge the modern e of Leigh was passed through, and drew remarks of admiration from all. As one t showed what could be done, without great se, in any rural district, by the exercise of e ingenuity and taste.

en Tunbridge was reached, the already party was again augmented in anticipation ceeding days of even greater interest; and ening was spent in most agreeable fashion, ıo being brought into the large tea-room, nging indulged in.

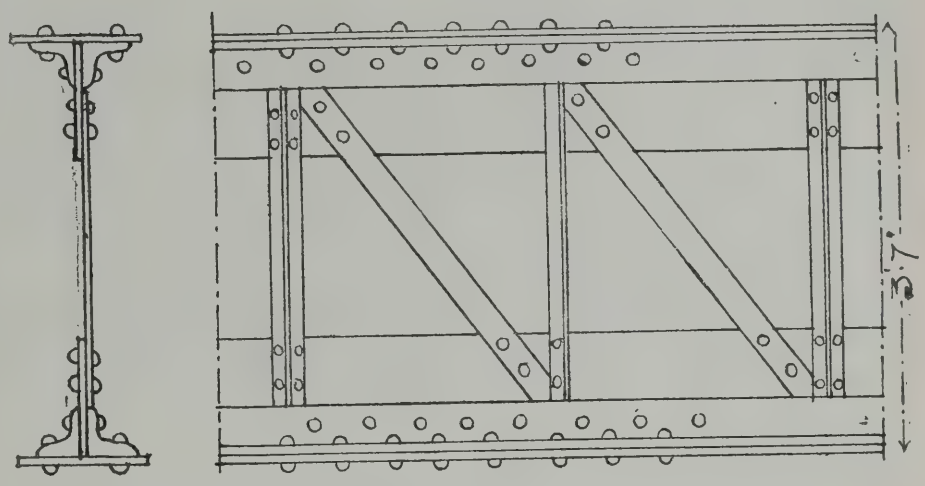
TRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XI.

By Banister Fletcher, Jun., A.R.I.B.A.

E "Galerie de Trente Mètres," which separates or cuts into two the main division e "Palais des Industries Diverses" and at one end, into the "Galerie des ines" by the connecting dome, and to ther in the great dome, looking on the p de Mars, is 626ft. long and 98ft. in . The length of the roof is divided into bays or divisions, the columns of which are apart, and correspond with the bays of the ustries Diverses" on either side. (No. 31.) e interior of the roof (see No. 35, from *eering*) has an inclination of about egrees, but the interior of the trusses is d to the form. The heights of the columns ft. 10in., and the back of the roof principal rises in a line with the back of these ards to a further height of 21ft. 3in. The d floor to the level of the gutter is 63ft. which is considerably above the level of to the "Expositions Diverses" themselves. vertical space above these abutting roofs erefore filled in with stained glass, and is no top light in this gallery. The me height from the ground to the ridge ft.



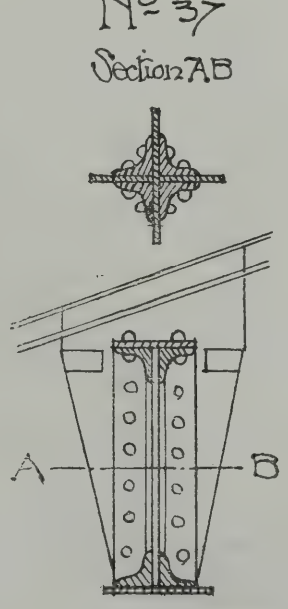
consequence of the great distance be- n the principals, the purlins are unusually ; there are seven running along the whole h of the gallery, one at the ridge and three ch side, and these rest on brackets attached e upright framing in the principals. The ns are 3ft. 3in. deep, and 12ft. 2in. apart, osed of angle irons and plates, and N ng in between. There are fourteen iron rs to each bay resting immediately on the ns, and these are carried right down the cal part of the roof, and rest on a girder g the form of the end of the abutting of the "Expositions Diverses" on each



neath this, at the level of the springing of roofs, runs a longitudinal girder, binding principals together (see diagram) and above inclosed in these triangular spaces it is filled with brickwork. The designs for the ances to the different sections, it will be ed, are made with a pediment to hide this. ne particular form of this roof was necessitated use it had to follow the outline of the great of the central dome.

ne main trusses are made up as follows 35):—The Extrados: (*âme*) web, 15·75in. 35in. thick; (*semelle*) flange, 17·72in. by n. thick; (*cornières*) angle-irons, 3·9in. by n. by ·39in. The Intrados: web, 13·78in. ·35in.; flange, 17·72in. by ·31in.; angle-s, 3·9in. by 3·9in. by ·39in. Besides this, tional flanges are added as required. (See ving.)

t the ridge, not being articulated, greater ngth was necessary, because of the pointed , and it is strengthened by webs and cover- plates in such a way that there is at this t five thicknesses of iron. The intrados and ados of these principals are united by a system prights in T iron and of lattice pieces in flat iron, or in T iron, according to whether they in tension or compression.



t the junction of the purlins with the trusses uprights in the truss are, however, formed of angle-irons, which receive the bracket of purlin between the angle-irons, and is ted up. On this bracket rests the purlin, as cated in the note above.

PURLINS AND ORDINARY RAFTERS.

The purlins (No. 36) having, as mentioned, a length of 82ft., which great span was necessitated by the spacing of the principals to suit the spans of the roof on either side. The "Expositions Diverses" are composed of a top and bottom web with angle-irons and flanges, and with N trellis framing in between. The purlin being 3ft. 7in. deep, the flanges being ·31in. thick.

Where the supports come the trellis framing is doubled and formed of two plate irons, 3·93in. by ·27in. The uprights are composed of two angle irons 2·75in. by 2·75in. by ·27in. thick. At a distance of every 3ft. 6in. at the place where the framing of a rafter occurs, the uprights of the purlins are composed of four angle-irons which clip a gusset piece ·23in. thick, placed to give support to the upper flange of the purlin. (See sketch No. 37.)

The ridge purlin, which carries the ventilating lantern, is thickened top and bottom by seven millimètres thickness of flange, which make the top and bottom flange 59in.

Ventilating lantern is 37ft. 6in. long, and is covered with zinc.

Standards (No. 35) are composed of two solid webs, each having a flange and connected by a couple of angle irons at each end. These standards are connected horizontally 26ft. above the ground by a double trellis beam, about 1ft 7in. high, which supports the vertical iron framework of the lateral framing. These standards also receive at the same height the extremities of the 25-mètre roofs on either side. The beam 1ft. 7in. high, connecting the standards mentioned above, is supported along its length by two solid iron standards, 11in. by 11¾in., and having a height of 39ft., which support the upper triangular framing formed by the abutting of the galleries of the "Expositions Diverses." On each side of these standards is a casing of "Maçonnerie" about 4ft. 6in. in width.

The bays which form the entrances to the French Industries on either side of this gallery form, probably, the most important interior decoration in the whole Exhibition, each section choosing its own architect. These designs are not only curious, but interesting, all the designs having to fit the same frame as it were, and each may be said to differ largely from its neighbour. These designs and their special *motifs* may be just glanced at now.

On Saturday, in connection with the centenary celebration at Marsden, near Leeds, the foundation-stone of a new Congregational Sunday-school was laid. The school, which is being built close to the chapel, is to cost £1,400. The style is Gothic, treated in a simple manner, and the work is being carried out from plans by Messrs. J. Kirk and Sons, of Huddersfield and Dewsbury.

Building Intelligence.

Aberavon.—A stained-glass window and a reredos containing five figures, given as a memorial of the late Mr. Llewellyn, were dedicated at the parish church on Tuesday week, together with a new pulpit and chancel floor. The reredos is constructed of rich-coloured marble and alabaster. The centre is formed of five arches, containing therein figures in white marble, of which the centre represents the Good Shepherd, while the other four are filled in with figures of the four Evangelists. All the niches have mosaic backgrounds, and the whole is finished with a moulded and carved cornice. The panels are carved throughout. The marble and alabaster work was prepared by Mr. Clarke, of Llandaff. The figures, by Mr. H. H. Armistead, R.A., were exhibited at the Royal Academy this year. The window is filled in with painted glass by Mr. Dixon, the subject being the Adoration of the Magi. Messrs. Kempson and Fowler, of Llandaff, designed the work. A drawing by them of the reredos was exhibited at this year's Royal Academy. The same architects have also designed complete fittings for the chancel, of which already the pulpit and screen in alabaster, the tile floors, and the steps have been executed. They have also decorated the walls of the chancel in colour on the plaster work. New gas fittings have also been introduced.

Bridestowe.—On Wednesday week the re-opening services, after partial restoration, of the church of St. Bridget, Bridestowe, were held. Some 20 years ago partial restoration took place, and now a second section of the work has been carried out. The chancel has been renovated, new oak seats have been put therein, and new altar and reredos of oak and Devon marble provided. A new doorway has been made to the vestry, and the lower part of the walls in the chancel have been lined with tiles specially designed. Messrs. Luscombe and Son, of Exeter, have been the contractors, and Messrs. Medley Fulford and Harvey, of The Close, Exeter, the architects. The cost of the restoration has been about £600.

Craig-y-Nos. — The bijou theatre which Madame Patti has erected at her Welsh Castle of Craig-y-Nos was informally opened on Thursday night. It will accommodate 180, and is Italian in style. The building is lighted with electricity, and is provided with appliances for the performance of opera or pantomime. The dimensions of the auditorium are 42ft. by 27ft., with a curved end at the back, in which is a small gallery. The height is 22ft., with a cove ceiling, supported by twelve Corinthian columns, dividing the walls into panels. The floor has a unique peculiarity; while it slants towards the stage there is an arrangement beneath by which it can be raised at the stage end to a level with the stage, so that a ball-room can be provided. The drop scene represents Madame Patti, as Semiramide, driving a chariot. The architects were Messrs. Bucknall and Jennings, of Swansea and London, who have arranged also the stage fittings and scenery. The builder was Mr. H. Smith, of Kidderminster. The scenery was painted by Mr. W. Haim, of London; the electric lighting supplied by the Wenham Light Company; the decorations by Messrs. Jackson and Sons, of London; and the heating apparatus by Mr. Legg, of Swansea.

The Salvation Army Temple at Exeter, which was at one time used as a meeting place for the "Friends," has just been considerably altered and enlarged. Seating accommodation has been increased from 900 to 2,000 persons. Mr. G. Coles, builder, of Exeter, carried out the work from plans by Mr. J. Williams Dunford, architect, of 100c, Queen Victoria-street, London, E.C. Mr. T. Morgan acted as architect's clerk of works.

On Saturday the corner-stones of a new mission-room and school, in connection with the parish church of Armley, near Leeds, were laid. The building, which is 70ft. by 30ft., is to be faced with pressed bricks. On an upper floor is a large room, running the whole length of the building, having an open timbered roof, and with a committee-room attached. It will accommodate 300 people. On the floor below are a schoolroom and classroom, together accommodating 150. The building, which is Early English in character, is being erected by Mr. Jonah Walker, of Armley, from plans by Messrs. Smith and Tweedale, of Leeds, and the cost will be £1,000.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Perplexed. (The arrangement you send us may be described as a "winged staircase," or staircase with twin flights. We are not aware of any other definite term being given to this variety of double-flight stairs.)

Received.—B. and M.—J. E. and Co.—E. G.—G. S.—E. A. W.—T. J. M. F.—A. D. W.—F. W. T.—G. T.—W G. and B. S. Co.

Correspondence.

COTTAGES, DAGENHAM, ESSEX.

To the Editor of the Building News.

Sir,—Pursuing the theme of your correspondent, the Vicar of Dagenham, last week, I may trouble you perhaps to let him and others interested in this subject know that I have, for several years past, acting on the instructions of a client, been endeavouring to let on building lease a plot of freehold land close to the village and on the main road (to Rainham), at present tilled by a gardener, and for which I have prepared plans for laying out the roads and covering with cottage property. Upon the frontage there is room for 19 houses and 4 shops, and for 37 houses with long gardens abutting upon the rear or cross roads.—I am, &c.,

Edward Crosse, Architect and Surveyor.
32, Bermondsey-square, S.E., Aug. 27.

At a special meeting of the King's Norton rural sanitary authority, held last week, Mr. R. Godfrey, A.M.I.C.E., was instructed to prepare plans for enlarging the hospital for infectious diseases, which was opened last year, and which has received 240 patients since October 1, 1889.

A new Free Presbyterian Church is in course of erection in Academy-road, Moffat, N.B. Competitive plans were submitted in March last, and those of Mr. D. B. Burnie, architect, Edinburgh, were selected, and are being carried out. The style is Early English Gothic. The church is to be built of whinstone from Moffat Well Quarry, with dressed red freestone facings from Corncockle Quarry. It will contain 700 sittings, and the height of the spire will be 123ft. The estimated cost is £4,200. The foundation-stone was laid on Friday.

Intercommunication.

QUESTIONS.

[10346.] — **Keble College Chapel, Oxf**
Would some kind reader tell me where the be
brown-red pressed bricks of the lower part of the i
were obtained, and give me some idea of the p
London?—R. W.

[10347.] — **Liability to Build Wall.** — I
pulled down an old house, I have thrown open my
bour's end, his house being built up against mine w
the least bearing in, or claim on my wall. Am I
to build him an end to shut up his house, as I do no
a wall where the old one stood? If so, on whos
must the wall be built, his or mine? I shall be g
have the opinion of some one who has had experie
such a case.—T. G. W.

[10348.] — **Domestic Hot-Water Supply**
carrying up the expansion or rising-pipe from the
hot-water cylinder up above cold-supply water c
is there any objection to turn the end down so as
near to, or slightly below, surface of cold water, so
avoid dampness in apartment where steam at ti
liable to blow off?—Learner.

[10349.]—**Kent.** — Will some one acquainted
Kent give me a few names of interesting e
churches, and domestic buildings, and where sit
that are worth visiting; and what part of Kent
richest for churches of a small rural type? Any
mation as to the best routes will be of servic
Intending Tourist.

[10350.]—**Spires: their Design.**—(1) Are
any examples of the construction of those? (2) W
an easy rule to entasise a spire? (3) Would
desirable to employ terracotta instead of stone? I s
like to know if there are any terracotta spires i
country?—Cyrus.

[10351.]—**Lead-work.** — How is the weight
lead used in flashings, gutters, &c., on a building
checked, in order to ascertain if it is as specified? Is
a gauge made for the purpose similar to the B.W.
any other standard method? A few practical
would be esteemed.—A. D. W.

[10352.]—**Modelling.**—I should like to know of
good manual on modelling in clay, as applicab
carved ornament. So many carvers in provincial t
either cannot or will not understand a drawing, it is
heartening to see one's designs murdered.—A. D. W

[10353.]—**The Proper Fall.**—What is the "p
fall" (so often specified by the authorities in the
laws) for drains? Also the minimum which shou
allowed under certain conditions.—Dreyheller.

[10354.]—**Steps to Chancel and Altar.**—
many steps should the chancel be raised above the
and how many should be placed in the sacrarium?
there any reasons?—Novice.

[10355.]—**Reducing Bearing of Beam.**—A
12ft. long carries a weight of 15cwt. distributed ov
length. If I insert a pillar 4ft. from one end, how
more will the beam carry safely, assuming that it
carries its full weight?—B. S. K.

[10356.]—**Breaking Weight.**—What weight
break a yellow pine beam 20ft. long, 12in. deep, and
in width? and what is the formula used?—Perplexe

[10357.] — **Groins in Brickwork.**—Is there
practical guide to cutting groin bricks? Any inform
will oblige.—A Pupil.

[10358.]—**Brick Column.**—Will any one give a
for a round column of brickwork 12in. in diameter, a
ing the working of the bond?—H. H.

[10359.] — **Intercepting Chamber.** — Will
sanitary reader say which is the best position to plac
intercepting chamber in drainage of a street-ho
I propose putting one in the area in front. Also, w
form of intercepting trap should be used? There are
so many, each claiming some merit of its own.—Y
Architect.

[10360.]—**Length of Churches.**—Which is
posed to be the shortest church in England—I mea
reference to width—and which is the longest? Any
formation will be useful to—Ecclesias.

[10361.]—**Tobin's Tubes.**—What causes the inte
air to ascend a vertical or Tobin's tube? Is it on acc
of the higher temperature of the internal air or
motion in the external air and the absence of motio
the internal air?—C.

REPLIES.

[10323.]—**Posts of Wood, Strength of.**—I
not Spon's Pocket-book, and consequently do not k
his formula. The formula given by Hurst is Gord
applied to wood, and it suits columns of any rati
length to diameter. The values 2½ and 3 tons for F
too high for large sections, as they are derived from s
selected specimens. At 2½ this formula gives a break
weight of 158 tons, and at 3 it gives 190 tons. Stoney
his valuable work on Strains, gives useful tables for
crushing strength of large pine timbers, with no spe
precautions as to bedding the ends, of which the foll
ing is one (Brereton's):—

Ratio of length to least breadth	10	15	20	25	30	35	40	45
Breaking weight in tons per square foot of section	120	118	115	100	90	84	80	77

He also gives the following:—Taking the force wh
would crush a cube as unity, the force required to brea
timber pillar with fixed ends, whose height is

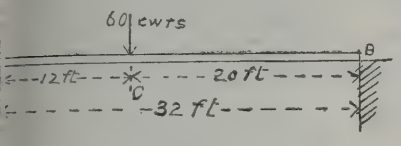
12	times the thickness, would be	1	5/6
24	,, ,, ,,	1	2/3
36	,, ,, ,,	1	3/4
48	,, ,, ,,	1	1/6
60	,, ,, ,,	1	1/5
72	,, ,, ,,	1	1/4

—B. E.

30.]—**Rolled Iron Joists, &c.**—For rolled oists—

$$W = \frac{12 \times a\,d}{l}$$

Where W = uniformly distributed breaking load in tons.
a = area of flange, d = depth of joist } in inches.
l = span in feet.



r of safety for dead load one fourth, when depth is nder $\frac{1}{12}$th span. For fir beams—

$$W = \frac{60\,b\,d^2}{l}$$

Where W = breaking weight in cwts. distributed
b = breadth of beam
d = depth } all in inches.
l = span

r of safety $\frac{1}{8}$ to $\frac{1}{10}$.—B. E.

38.]—**Beam.**—1½cwt. per foot run on 24ft. = 30cwt. t. distributed load = 60 cwt., concentrated load at a 12ft. from A—

$$\text{Reaction at A} = \frac{30 \times 20}{32} = \frac{75}{4} = 18\tfrac{3}{4}\text{cwt.}$$

$$\text{Reaction at B} = \frac{30 \times 12}{32} = \frac{45}{4} = 11\tfrac{1}{4}\text{cwt.}$$

r Reaction at B = $30 - 18\frac{3}{4}$ = $11\frac{1}{4}$cwt.
H. S.

38.]—**Beam.**—Reaction on loaded end $18\frac{3}{4}$cwt., on ded end $11\frac{1}{4}$cwt.—B. E.

39.]—**Centrolinead.**—"Perspective" will find llowing an accurate and easy method of setting the olinead:—Find the vanishing points in the usual to each of which draw on your paper two con- ng lines. Draw also the horizontal line. Fix two ion pins in *any* convenient position at the left and sides of the board, one above and one below the ontal line in each case. Now set one of the centro- ls for a *trial* with the short arms against their pins he long arm *coincident with the horizontal line;* move istrument up or down to a converging line, and see ner the angle made by the two short arms wants to ore acute or obtuse, and alter the angle accordingly, ng the long arm *against the horizontal line* during alteration. After one or two *trials*, the long arm e found to fit the two converging lines and also the ontal line. The instrument is then set correctly. In ilar manner set the other centrolinead.—J. Ezra ER.

44.]—**Coke-Breeze Concrete.**—Six inches is essarily thick for the coke breeze, and pitch is not sary, as the floor-boards can be nailed directly to the concrete. I suppose "L. S. N." refers to a d floor; if so, the method of laying is as follows:— p the floor space with chalk, lime, coal, or any dry sh to within 6in. of the finished floor level; on that n. of Portland concrete, and on that 2in. of coke- e concrete. To get this level, lay strips of wood wide and any convenient thickness on edge at rals of 6 or 8ft. before the coke-breeze is laid, to form ds. These strips need not be removed when the ete is laid; but, of course, they are not required for g the boards to, as the coke-breeze concrete holds better than any wood. The coke-breeze concrete d be mixed in the proportion of four parts to one of Portland cement; should be thoroughly mixed in state first, and then water gradually added until ixture is quite sloppy; this is necessary because the absorbs a great quantity of water.—C. F. M.

45.]—**Colouring Cement.**—Use Portland nt, and write to W. Grahmam, Yooll and Co., 24, ff Brae, Leith, for the colouring matter.—C. F. M.

---

e parish church of Kilwinning, N.B., was re- ed on Friday after extensive alterations and ovements. Three memorial windows have been ed, all the work of Messrs. W. and J. J. , Glasgow.

n Sunday the Roman Catholic Bishop of lwsbury laid the foundation-stone of a new ch in Gatefield-street, Crewe. When com- d, the church will consist of chancel, side els, nave, aisles, baptistery, external porches, essionals, &c., with priests' and working sties connected with the presbytery by a ter. The total height to the top of the tower be 90ft. The cost will be about £4,500.

cairn called Harelaw, near Lochore Castle, shire, has been excavated during the past week dr. Constable, of Glencraig. Beneath a pile tones 30ft. high a stone cist was discovered, on the freestone cover being removed a ary urn was exposed to view, containing an bones and wood ashes. The cist was f by 18in., and 15in. in depth. It is composed ur flat and dressed stones set on edge, puddled e and below with clay. The urn, which is entire, is remarkably perfect in shape, formed ay, and is entirely covered outside by the l rude ornamentation. It is 5½in. in height, t. in circumference at its greatest girth, taper- o 9in. at its base.

WATER SUPPLY AND SANITARY MATTERS.

Moffat, N.B.—Since 1867 Moffat has been supplied by gravitation with water from a spring near Granton House, about three miles above the town. This supply is practically inexhaustible, as the spring yields 250,000 gallons per day. The town has hitherto been supplied by a 6in. pipe, but, owing to the increase of the number of houses which have been built at the higher levels within the burgh, there have been complaints of a want of constant supply during the forenoons. To obviate this difficulty, a new 6in. pipe has just been laid by Messrs. D. M'Donald and Son, Hawick, in accordance with plans prepared by Mr. T. O. Niven, C.E., Glasgow, at a cost of £2,390. The inaugural ceremony of turning on the additional supply took place at Granton on Saturday.

Thirlmere Water Supply for Manchester.—The members of the Manchester Corporation visited Lake Thirlmere on Friday, when Sir John Harwood, as chairman of the water committee, laid the foundation-stone of the embankment. The corporation, acting under the advice of the late Mr. J. F. La Trobe Bateman, obtained Parliamentary powers in 1879 to embank the lake, and since then the work has steadily progressed, under the direction of Mr. G. H. Hill, C.E. The drainage area to be appropriated is 11,000 acres, and the rainfall varies from 52in. to 137in. It was at first intended to raise the lake embankment 50ft., by which a storage of 8,130,686,693 gallons would be obtained, but upon further consideration the corporation determined for the present to only raise it 20ft. The aqueduct from Thirlmere to the reservoir at Prestwich is nearly 96 miles in length, consisting of tunnels of a total length of 13¾ miles, cut and cover 37¾ miles, and cast-iron piping 44¼ miles. The Parliamentary estimate for the works, inclusive of land, is, for the first instalment of 10,000,000 gallons per day, £1,740,437; and for the ultimate supply of 50,000,000 gallons per day, with land and interest of money, the cost will be upwards of four millions sterling. In 1884 the land arrangements were sufficiently advanced to enable the preparation of the works for letting to be proceeded with, and the first contract was let at the end of the year 1885. For the present only one line of pipes will be laid, but water will flow through at the rate of 10,000,000 gallons a day. Everything, however, in the nature of permanent works, such as tunnelling, will be for the full quantity of five lines of piping. The aqueduct is completed in many places, and there is no outward sign that the ground has been cut beyond the "manholes," which are placed at distances of a quarter of a mile apart. It is expected that Thirlmere water will be delivered at Manchester within two years from the present time.

STATUES, MEMORIALS, &c.

Brussels.—The new Waterloo Monument in Evére Cemetery was unveiled on Tuesday by the Duke of Cambridge. It represents a sarcophagus, 9 mètres in length and 4 mètres in width, in red Trèves sandstone, on which helmets, flags, and other emblems in bronze are disposed in masses. Around its surface three bronze lions in varied attitudes watch, and at the top of it Britannia, holding her casque in one hand and a lowered trident in the other, kneels at an altar. The vault below contains the coffins of sixteen officers who fell or died in consequence of wounds received in the battle. Two flights of stone steps lead down to the entrance of the vault, on both sides of which bronze shields bearing the names of the regiments which took part in the battle are fixed. Above the entrance an inscription explains the object of the monument. Around the monument are placed the tombstones originally erected in the old cemeteries where the officers found their first rest. Count Jacques de Lalaing designed and superintended the execution of the monument, and Mr. Geering was the architect.

A provisional committee was appointed at Wellington, Somersetshire, on Tuesday, to take steps for the restoration of the National Memorial to the Duke of Wellington. This lofty column, which stands on a spur of the Blackdown Hills, was struck by lightning some time ago. The repairs are estimated to cost £500.

In continuation of the work of restoration which is gradually being carried out at St. Germain's Church, Cornwall, the organ has recently been reconstructed and enlarged, at a cost of £265, by Messrs. Hele and Co., of Plymouth.

A solicitor applied at the Preston County Court on Tuesday, for the annulling of the bankruptcy of George Tinniswood, land surveyor, now of Stockport. The debts, he said, had been paid off, together with interest at the rate of 4 per cent. The official receiver, who was present, had paid off all in full, along with the 4 per cent. The judge granted the application.

Our Office Table.

Mr. Charles West Cope, retired B.A., the well-known painter of historical and domestic scenes, died on Thursday in last week at Bournemouth. The son of a painter, Mr. Cope was born in Leeds in 1811, and on coming to London studied under Mr. Sass, and joined the Academy School. His first picture, painted after a two years' stay in Italy, the "Holy Family," was purchased by Beckford. He exhibited at the Academy from 1833 till 1882, about 140 works appearing after his name in the catalogue. In 1844 he was elected an Associate of the Academy, becoming B.A. four years later, while from 1867 to 1874 he was Professor of Painting at Burlington House, and a trustee until his decease. In 1843 he entered in the Westminster Hall competition, and for his cartoon "First Trial by Jury" gained a £300 prize. In 1844 he took part in another competition for frescoes, and his success with the "Meeting of Jacob and Rachael" procured him a commission of one of six frescoes for the new House of Lords. Eight of the frescoes in the Peers' Corridor were executed by him. Mr. Cope was one of the original members of the Etching Club.

Some of the newly organised county councils appear to be inclined to treat the officials whom they have taken over from the magistrates in anything but a generous or liberal spirit. We recently commented on the conduct of the Suffolk Council in refusing a retiring allowance to the county surveyor, who had held office for a quarter of a century, and now hear of similar tactics in Montgomeryshire. The latter body recently determined not to permit their surveyor to acquire rights to a pension and retirement, and accordingly gave Mr. W. N. Swetenham, who has for many years held that appointment, notice that after the 1st of October next he will merely be elected at a salary of £300 a year, and with no claim to superannuation. At the meeting on Friday a letter was read from Mr. Swetenham, in which he stated: "As I question the right of the Council to dismiss me without blame (*ad vitam aut culpam*), I am unable either to accept or decline the offer made, as by so doing I should practically acknowledge the right of dismissal." A long discussion followed the reception of the letter, in which while high commendation was given to the mode in which Mr. Swetenham had discharged his duties, some irritation was expressed that he did not more humbly acknowledge that he is the servant of the Council. Eventually it was decided by a majority to declare the office of county surveyor vacant and to advertise for a successor.

With, as he says, the object of putting "the responsibility on the right shoulders," Archdeacon Sinclair writes that the painting of an arch of the choir of St. Paul's is being carried out by Messrs. Bodley and Garner, "by permission of the Decoration Committee." The painting, he adds, is purely experimental, and if the Decoration Committee do not approve of it, it will be scraped off again. He adds that Messrs. Bodley and Garner have arrived at the conclusion that Sir Christopher Wren intended the surface of the interior of St. Paul's to be painted. The Rev. Dr. Sparrow Simpson corrects this tentative view by adducing proofs demonstrating that not only did Wren "intend" that paint should be applied to the interior of the cathedral, but that, as a matter of fact, the walls were actually painted under his direction. Indeed, violent attacks were made on Wren for having had the walls painted at a cost of twelvepence per yard when the same man was doing similar work at Greenwich for eightpence, and alleged that Wren employed the man without the direction or consent of the Commissioners, and without making a contract. In the following year Wren's reply was published, to which was appended an affidavit by Joseph Thompson, son of Wm. Thompson, the painter, by whom the work was executed, averring that as some of the stones had to be covered several times over, the shilling a yard was not a sufficient price, and that the work was to be further valued at the conclusion of the job. Mr. Cavendish Bentinck argues that since, upon the advice of high architectural authorities, the Ecclesiastical Commissioners expended a large sum in removing the paint from the walls, it is absurd that Messrs. Bodley and Garner should be allowed to repaint the surfaces.

Mr. Frederick S. Waller has re-issued, in an enlarged form, his "Notes and Sketches" relating to Gloucester Cathedral. Excepting in the aisles of choir, the north aisle of nave, and that of the chapter-room, he shows that what appears of the abbey church of the 12th century is a mere shell. In the choir the walls have been actually pared down and an outer casing has been entirely removed; large pieces have been cut out of the piers for the introduction of Mediæval monuments; window heads have been removed and replaced, and the whole building was covered in the 14th century with appliqué work of mullions and tracery. Strange to say, although new walls, vaulting, and roofs are now carried on the old foundation, as well as the great central tower, scarcely a settlement of any kind can be seen in the building.

Amongst the appeals just decided by the Camberwell Assessment Committee is one of more than local interest, viz., whether an observatory, built in the grounds attached to a gentleman's residence for purposes of observation and scientific research, can be said to add to the annual value of the premises. Sir Henry Bessemer, at considerable cost, erected, not long since, an observatory in his grounds, and in due course the overseers assessed it at £100 gross value. Mr. W. H. Blanch, Assessment Surveyor, Ludgate-hill, who conducted the appeal on behalf of Sir Henry against the assessment of his property as a whole, objected particularly to the assessment placed upon the observatory, on the ground that, instead of adding to the annual value of the hereditament, the observatory had, in his opinion, reduced it. Overseers, Mr. Blanch contended, were too prone to assume that an expenditure of money must necessarily increase annual value; whereas it often, as in Sir Henry Bessemer's case, operated the other way. In the end the Assessment Committee, whilst not conceding all that was asked on behalf of the appellant, made a substantial reduction on the assessment.

The programme of the Technological Examinations for the year 1890-91 just issued by the Council of the City and Guilds of London Institute, shows several improvements on those of previous years. The distinction between the requirements for the ordinary and honours grades has been more carefully marked in each syllabus, and the lists of works of reference have been revised and brought up to date. We note that in future, in the case of architects who apply for examination in practical plumbing and who fail to present themselves, the entire fee will be retained by the Institute. The new session will commence in October next. The prize list for last session includes the following awards: — Brickwork and masonry: 1st in honours grade, £3 and silver medal, William H. H. Lord, Peterborough; 1st ordinary, £2 and silver medal, Joseph E. Fletcher, Sheffield; 2nd honours, £2 and silver medal, Victor T. Jones, Central Institution, Kensington; 2nd ordinary, £2 and bronze medal, Archibald C. D. Steele, Central Institution, Kensington; 3rd ordinary, £1 and bronze medal, David D. Calder, Lochee, N.B. Carpentry and Joinery: 1st with honours, £5 and silver medal, Daniel Bryant, L. and S.W. Mechanics' Institute, Vauxhall, S.W.; 1st ordinary, £3 and silver medal, Charles B. McElwee, Kirkcaldy; 2nd honours, £4 and silver medal, Charles W. D. Boxall, Central Institution, Kensington; 2nd ordinary, £2 and bronze medal, Martin Thomas, Coatbridge; 3rd ordinary, £1 and bronze medal, Frederick J. Wass, Heriot; Watt College, Edinburgh. Plumbers' Work: 1st ordinary, £2 and silver medal, Albert E. King, Merchant Venturers' School, Bristol; 2nd ordinary, £2 and bronze medal, William McAlpin, Glasgow Technical College; 3rd honours, bronze medal, Alexander Knowles, Aberdeen; 3rd ordinary, £1 and bronze medal, John W. Chapman, Plymouth; 4th ordinary, bronze medal, Alexander R. Will, Aberdeen; 5th ordinary, bronze medal, John A. Shervill, Polytechnic Institution, London.

Mr. T. J. Moss Flower is showing this week, at Stand 34 at the Health Exhibition held at Brighton in connection with the Sanitary Institute, a cheap and handy little adjustable gradient indicator, which should be in the possession of every architect, civil and sanitary engineer, builder, sanitary inspector, or clerk of works. By its aid drains can be accurately laid to any required fall by simply applying the bed of the level to the upper surface of the drain-pipe or straight edge. It can also be used as an ordinary level, is only 9in. long, simple in construction, and requires little or no experience to use it. It will repay its very moderate cost many times over to any purchaser within the first six months.

Mr. D. T. Bostel has, as usual, one of the best exhibits at the Health Exhibition at Brighton this week. He shows his new "Brighton Excelsior No. 2" closet, which is an ingenious development of its well-known predecessor, having all its advantages and one or two decided and desirable improvements. Mr. Bostel also exhibits his cisterns, which we not long since noticed, and a new Ball Tap, about which we shall say more presently, and which is certainly novel in idea, and we really think obviates the many difficulties which somehow seem inseparable from every successive "patent" tap. There is also a capital collection of plumbers' brass fittings, belonging to the Meyer-Sniffen Manufacturing Company, of New York, which some of our sanitary appliance manufacturers may profitably study, though, of course, many of them will remind us that people won't pay the prices here that the sanitary plumber can ask in America.

On Saturday (August 16) the employés of Messrs. Thos. Gregory and Co., of Station Works, Clapham Junction, held their annual beanfeast at Portsmouth. The men left Clapham Junction, in special carriages, by the South-Western Railway at 6.45 a.m., arriving safely at Portsmouth Harbour about 9 o'clock. A substantial dinner was provided at Maybour's Restaurant for 12 o'clock, at which Mr. Thomas Gregory took the chair, supported by his partner, Mr. G. C. Hudson, and the committee of management. After the usual loyal toasts had been duly honoured, Mr. Rouse, shop foreman, proposed "The Prosperity of the Firm," alluding to the large quantity of work executed during the last quarter of a century, which he described as sufficient for a moderate-sized country. The toast was heartily received with musical honours. In responding, Mr. Gregory thanked the men for the good feeling expressed, and congratulated the building trade generally on the settled and peaceful state of the trade in this age of agitations and strikes. The toast of "The Foreman" was given by Mr. A. J. Farmer, representative of the clerical staff, and responded to by Mr. J. Newton (22 years with the firm), who advised the men to study themselves by studying others, and alluded to the good-feeling that always existed in the firm, several of those present having been over 20 years with the firm. Mr. Bowman proposed a toast to those who had so well managed the excursion, and Mr. Down, the Secretary, appropriately responded. Mr. Forsey, Mr. Easter, Mr. Dorey, and Mr. Davis also spoke, and after one or two well-delivered songs, the majority repaired to the boat for Ryde, Isle of Wight, accompanied by genial weather, returning from Portsmouth at 7 o'clock, after an interesting and social outing.

CHIPS.

During the past week a deputation from the City Corporation of London have visited Manchester, Edinburgh, and Glasgow, for the purpose of inquiring into the water supplies of these cities.

Mr. W. F. Bird has been appointed surveyor to the local board of Midsomer, Notts. Over 100 candidates sent in testimonials, etc., though the salary offered is only £100 a year.

The Commissioners of the Clerkenwell Free Public Library have decided to throw open the new section of the institution, the lending and reference library, to be opened a fortnight hence, on Sundays from three to nine p.m.

Holloway's Ointment.—Glandular swellings in the throat, neuralgia, tic doloreux, rheumatism, gout, lumbago, and other diseases affecting the glands, muscles, and nerves of sensation are permanently eradicated by this healing anti-febrile and soothing preparation. It is also a perfect remedy for all skin diseases, and every kind of superficial inflammation.

TENDERS.

*** Correspondents would in all cases oblige by giv the addresses of the parties tendering—at any rate, of accepted tender: it adds to the value of the informatio

Barry.—For widening the railway bridge at East Ba Mr. J. Robinson, C.E., engineer:—
Strachan, J., and Co., Cardiff (accepted).

Barry Dock.—For the construction of a wrought-i bridge of nine openings, each 24ft. span, over the Ba Railway Co.'s line at Barry Island. Mr. J. Robins C.E., engineer:—
Strachan, J., and Co., Cardiff (accepted).

Bedminste, Bristol.—For the erection of a Primit Methodist chapel, near Bedminster Down:—
Elmes, G., Bedminster (accepted).

Blackheath.—For rebuilding and fitting up the Geo and Dragon p.h., and house adjoining, at Blackheath H S.E., for Mr. W. Prangnell. Mr. T. H. Smith, 17 and Basinghall-street, E.C., architect. Quantities by Mr Taperell:—

Williams, H. J.	£6,580 0 0
Smith, W.	6,183 0 0
Holliday and Greenwood	6,079 0 0
Patman and Fotheringham ...	6,064 0 0
Jerrard, S. J.	6,034 0 0
Kearley, C. F.	5,670 0 0
Holloway, H. L.	5,569 0 0
Allen and Sons	5,560 0 0

Bow.—For altering and adapting No. 199, Bow-ro E., for Mrs. F. Davies. Mr. J. W. Dunford, 100c, Qu Victoria-street, E.C., architect:—
Coxhead, F. J., Leytonstone (accepted) ... £280

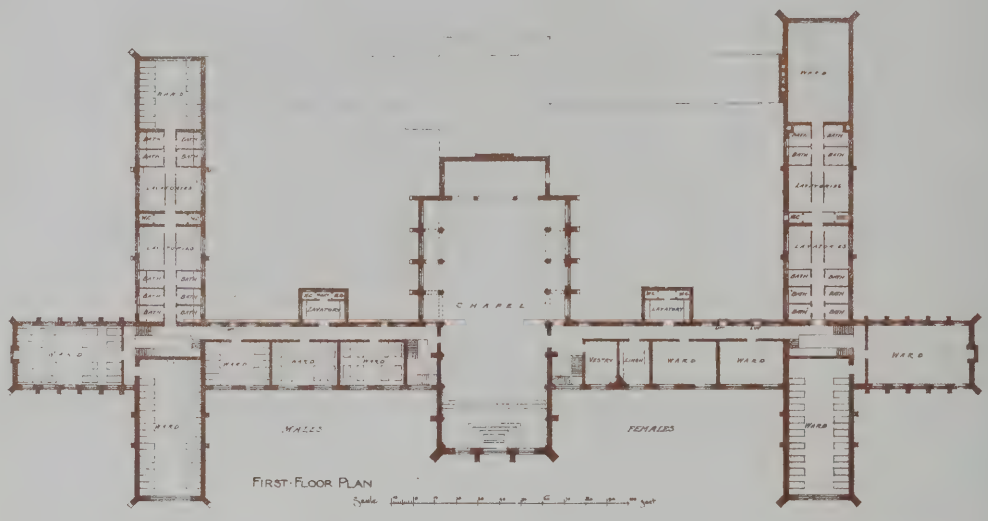
Brackley, Northants.—For works of drainage at workhouse, for the board of guardians. Mr. R. Russel, architect and surveyor:—

Claridge and Bloxham	£498 0 0
Jarvis, E.	475 0 0
Harding, W. J.	445 0 0
Wooston, A., Brackley	400 0 0
Jenkins, W., and Son, Leamington*	320 0 0

* Accepted.
Rest of Banbury.

Camberwell.—For improvements to laundry, sto &c., for the Camberwell Infirmary. Mr. R. P. Whello 45, Finsbury-pavement, London, architect:—

Garner, A.	£369 15 0
Evans, R.	369 0 0
Young and Lonsdale	365 0 0
Goad, W. V.	289 0 0
Treweeke, F. P. (accepted)	288 0 0



Cheshunt.—For the erection of engine-house chimney-shaft, for the Cheshunt Local Board of Hea Mr. T. Bennett, C.E., engineer:—

Kirk and Randall	£1,961 0 0
Hunt	1,950 0 0
Holliday and Greenwood	1,930 0 0
Dickson, J.	1,929 0 0
Killby and Gayford	1,630 0 0

ND ENGINEERING JOURNAL.
VOL. LIX.—No. 1861.
FRIDAY, SEPTEMBER 5, 1890.

WALL DECORATION.

IE importance of wall decoration has never been questioned. The chief ments that have been used against it ounded on the injurious action of our te on the materials, more particularly regard to external decoration; also the of a certain proportion of restful ce between the architectural features details. These arguments are strong, h they have in no measure lessened the of surface decoration when applied to ns of our buildings which require ment or relief, such, for example, as pper portion of façades, the friezes of edifices—external and internal, panels, pilaster spaces, and other like parts. now there is a strong inclination to aterials that are cheap and attrac- without inquiring whether there is ome more artistic mode of dealing these surfaces. Cannot the artist be ht to the wall himself to design or a subject or a pattern, or cannot the ect suggest what should be done, and are that his ideas are carried out by the orkman? These are questions which not been satisfactorily answered, and ot be, so long as the architect has no in decoration, and so long as the nd art craftsman are so dependent on employers—those who contract and arge profits as contracting middlemen. and art theorists are constantly ning about the poverty of mural decora- England—how little we encourage the ishments of our public buildings by artists; but the reason is that easel g is so lucrative as a profession, that ainting has almost ceased to become and has now been handed over to ors and stencillers. Only when the ct and painter will agree to value their ces and work in unison, as they once ll wall decoration regain the position rt it then enjoyed.

ces admit of various kinds of decora- Brick diapers, terracotta slabs, tiles ich designs have been drawn or , incised ornament, marble veneer- saics, sgraffito, and other plaster or decoration, are among the methods . To attempt to treat of all of these e superfluous; our aim is rather to what directions artistic wall decora- be made to play a valuable part in hitecture. Two forms of wall en- t have become popular of late: the brick ornament and painted tilework. ner has been employed to relieve the gables, to fill in between timbered s; the latter for lobbies and interior A slight relief or broken surface is by the brick diaper in which the a repeat of a diaper pattern cast or on each square, though sometimes gn is extended to four or several we see in panels introduced with nal designs of a floral cha- brick buildings. This idea of composed of several tiles or might be developed. We have not many successful attempts to pro- chitectural ornamentation in this in the shape of panels, bands, and which each square or slab might action of the whole design.

ese purposes terracotta has largely place of bricks; because the whole n be produced in one or a few slabs. are restrictions: it cannot aim at the delicacy and precision of a bas-relief in stone; there are limits to the size of the slabs, and imperfections due to the manufacture and burning. The principles of bas-relief apply to this kind of decoration—namely, that it is an incorporative part of architecture, the latter furnishing the framework. The things represented should be those which are palpable and can be at once perceived—the effects of a picture must be avoided. Bas-relief on buildings should represent to the public gaze facts and events, historical, religious, allegorical, industrial; the attributes and accessories should be conceived in a symbolical manner. Other laws are necessary: the modeller should present only clearly-comprehended figures or images; that is, the figures or groups should appear distinct from the ground; he should obey the law of preserving two or three planes of projection; but the fewer the planes the better the effect will be. These principles have been well enforced by the eminent French sculptor, M. Guillaume, who says that experience has shown it is wise not to go beyond two or three planes superposed. To prevent confusion also, he says, "the different parts of the subject must have a general projection which will render it in some sort independent of the elements surrounding it or touching it." Different positions in a building require different heights of relief: the nearer to the eye the lower the relief. These and other necessary rules apply with equal force to terracotta relief, though they are often disregarded. Again, bas-relief in any material must be distinguished from painting. It must not seek to imitate painting such as the effects of perspective, an error we have often seen committed. Plain colouring of bas-relief has the sanction of ancient precedent; but it is one of those things which requires the utmost moderation and judgment. The colours should be broad and simple, perhaps only a flat tint over the figures, or a dark background to throw them out in their natural burnt tint.

Because ancient sculpture in Greece and Assyria have been found coloured, polychromists have concluded that we ought to do the same, and argue that our public buildings should be glowing with colour, not seeing that the climate and sunlight make all the difference, and that while intensity of colour modifies and subdues the strong light, and is necessary under Southern skies, coloured buildings would absorb light and have a contrary effect in this country. Colour has been found in this broad, flat manner on the grounds of tympana and metopes, blue or red; the figures stood out upon such a background, the emblems, drapery, and ornaments being strongly marked with colour or gilding. The ground of the Panathenaic frieze was blue, the figures relieved by gold and colours, the architecture beneath being left plain. Modelled or sculptured bas-relief surfaces, are certainly the highest kind of architectural decoration. If we colour them, we should do so on the principles which guided the Greek artists in their treatment of architectural sculpture. As Gambier Parry pointed out, colour made a part of a complex effect, whereas independent statuary was clear of all obligation, and its colouring had relation to itself, and, therefore, a few touches of colour on drapery and accessories, tenderly introduced, and with the object simply of more clearly emphasising the figure, sufficed. The Wedgwood idea of colouring relief is that which appears to us to be the right one for our external surfaces, as in friezes and panels. A future for this kind of decoration appears evident; hitherto architects have been handicapped by mechanical reproductions, imperfect manufacture, and the natural distaste to have their designs repeated in all kinds of places and for all sorts of purposes. Improvements in the manufacture of terracotta are removing these objections, and are leading to more artistic productions in which the hand of the artist or sculptor is more directly concerned than it is now by the intervention of moulds.

Another question in connection with decoration of this sort is, Where should it be placed? All recognise the value of friezes and panels so embellished, in which there are broad surfaces. Thus panels of terracotta, or carving in bas-relief, look well below the entablature of a main order, between the columns and above the principal windows, or as panels in an attic. In buildings in the style of the Empire, we find this mode of decoration resorted to. The panelled reliefs of the Arc de l'Etoile, the enriched friezes and attics of many of our own classical Italian buildings, illustrate the beauty and refined elegance of surface decoration so introduced, the only condition being that a sufficient breadth of plain wall surface should be preserved, or else a frittered effect is the result. According to one of Ruskin's dicta, wherever the eye can rest there decorate; the panelled surfaces are the proper ones for embellishment, though the principle appears to conflict with those examples where the decoration is employed on the least restful features, as those of arches and pilasters. We find, for instance, many beautiful buildings in the style of François Premier in which the surface ornament is applied to the pilasters in the form of panels, and in more elaborate Renaissance buildings arabesques are introduced in panels of pilasters and arches with elaborate carving and with soffits enriched. The ornament is confined to pilasters, arches, friezes of entablatures and window dressings, while the retiring wall surfaces are left quite plain. The relief on these parts are, however, generally low, and the angles and margins of the panels are rigid and emphasised, and express the active functions of the pilaster or arch. The principal condition is fulfilled, namely, that the ornament is confined to the smaller surfaces, while the plain wall surface becomes a rest to the eye. Ornamental terracotta is available for both these modes of decoration. It can be used as slabs on the wall, or in pilasters, columns, arches and dressings round doors and windows. But decoration cannot be used in both places at the same time. The effect of wall and feature decoration would be to render both ineffective—to destroy each other. Some architects do not appear to think so; they employ both, and the result is that the value of the decoration is lost because there is no contrast or relief.

A question of almost equal importance is the relative position to be given to architectural or conventional ornament and figure or pictorial subjects. Here also we find a variety of practice. The right principle is to decorate structural parts with forms which are akin and have a cognate character, for which reason the architectural kinds of ornament such as diapering, geometrical figures, and continuous enrichments like the fret, egg-and-tongue, and scroll appear to be best adapted. These latter are common in friezes and horizontal bands, while vertical parts like piers and pilasters should have forms of rectilinear or curvilinear variety. The Raphaelesque decoration or arabesques, composed largely of foliage and griffins, are more adapted for the panels of pilasters and piers. In the interior of buildings this imaginative and capricous kind of ornament can be used for wall and pilaster panels; but it is less suitable for the exterior of buildings. Then we come to the non-structural parts, such as friezes and panels in walls, here figure sculpture and relief appear more appropriate. The more elaborate and highly-finished works of this class should be placed where they can be easily seen and appreciated, leaving to

the upper portions of façades the bolder designs, in which the figures are merely outlined in single or clearly discerned groups. Referring to effective decorations of this sort, we may allude to a new kind of sgraffito decoration introduced by Messrs. Doulton as a frieze in their recently-erected art-pottery building. Instead of the pattern being scratched through a layer of light plaster upon a darker layer, as seen in the sgraffito decoration at the back of the South Kensington Museum; the figures in the frieze are on tiles of clay, incised by a small tool of any width, and filled in with "slip" of a dark colour. The tiles can be made to follow these lines in their jointing, or be of the usual square shape. The figures are buff in a darker shade. The artist draws with his own hand the design on the clay. Great breadth and clearness of outline are the result of this process. By another method the design can be outlined by a raised line or rib forming the pattern, which can then be filled with any colour. Sgraffito and mosaic are two kinds of decoration especially suitable for the purpose. Our public buildings, our board schools, technical schools, museums, and libraries are admirable structures for this broader kind of decoration. Why should not their walls and friezes tell the story of the arts in simple language, instruct the wayfarer by allegories, and teach moral precepts on frieze or panel?

METROPOLITAN BUILDING LEGISLATION.

THE important building sections which have been introduced into the new Act just obtained by the London County Council have been casually referred to by us. One of the most useful sections is a Tribunal of Appeal from the decision of the superintending architect upon questions relating to lines of frontage. The new tribunal is to be a court of three of co-equal authority. Two of the three members are to be nominated by the councils of the professional bodies, so as to obtain experts, the third to be a nominee of the County Council. We have had painful evidence of the need of such a court, in the unexplained way decisions have been given and buildings erected in violation of the plain meaning of the provisions of the Act. In one case a shop has been allowed to come forward before other recently-erected buildings, and in another we find a public structure made to set back. More extended powers are required for the Court of Appeal than have been given it. Why should not every technical question affecting building in the Metropolis be decided by it?

One of the most important sections of the Act has reference to the maximum cubical capacity of buildings for the purpose of trade or manufacture. The old provision of 216,000 cubic feet as a maximum was, to our mind, quite sufficient; the proposed maximum limit of 450,000 is undoubtedly fraught with danger, as we have pointed out. Capt. Shaw and others have pointed out the greater risks involved in the extension of cubical space. It means warehouses of more than double the former capacity, in some cases filled with inflammable goods, to cope with which, in case of a fire breaking out and obtaining the mastery over the entire area, means a large extension of fire-extinguishing resources. The Council have, it is true, proposed certain conditions or restrictions which must be complied with before their consent to erect buildings of this size without party-walls. Before consent can be granted the Council must be satisfied "upon the report of the superintending architect and of the chief officer of the Fire Brigade that the additional dimensions are necessary for the purpose of the trade or manufacture carried on, and that proper arrangements have been, or will be, made and maintained for lessening, as far as reasonably practicable, danger by fire." In no case shall consent be given in the case of buildings exceeding 60ft. in height, and it is further provided that consent shall continue in force only during the time the premises are *bonâ fide* used for the purpose of trade in respect of which it was granted. These reservations are very necessary accompaniments to the clause; but even they do not very distinctly assert what kind of "proper arrangements" are to be made in the new buildings to reduce the risk of fire. These should be not only preventive, but specify means of extinguishing. Solid and well-constructed floors, with encased iron girders and columns, properly constructed lifts or hoists, with fire-resisting doors at each level, safety lighting and heating regulations, would be included in the former; while amongst the latter automatic extinguishers and sprinklers, tanks in convenient positions, hydrants on every floor, and other fire-extinguishing appliances ought to be required. The danger is that the phrase above quoted will permit a rather low standard of requirements. The only absolute restriction is that limiting the height to 60ft.—a very necessary condition. A few more structural rules might have been made absolute, having reference to the construction of roofs, floors, and lifts, the arrangements for the supply of water to each floor, fire doors, and staircases. These are matters which, if left to the option of the authorities, might be seriously compromised.

The section (33) dealing with buildings abutting on more than one street, or on corner sites, is one that very materially concerns the owners of corner sites. The original framing of the clause would have prevented an owner of a corner house which had been pulled down or destroyed by fire from rebuilding it without a large sacrifice of land, for it would have compelled him to set back his building to the line of the buildings in the side street; the section, in fact, says that no corner building fronting to one road shall have its side erected in advance of the general line of building in the side street, provided that such line is not more than 50ft. from the side road, without the consent of the County Council, who may impose terms and conditions. Had such a clause been in force a few years earlier, we should have been spared the disgraceful encroachment of shops on corner sites in many of our thoroughfares, which sites were formerly occupied by houses set back within grounds of their own. The section, as it is passed, applies only to a building "other than on the site of a building, or on land held with a building existing at the time of the passing of the Act," or on land laid out at that time, which practically limits the operation of the rules. The objections urged against the original wording, on the ground that it would compel an individual to sacrifice his land for the public convenience without compensation, would render it impossible to make any improvement in public thoroughfares. Compensation, no doubt, should be given to an owner who gives up his land for public improvements, but it should be based on a moderate schedule. This section, as it stands, is not wholly satisfactory or clear in phraseology, though it is a step in the right direction. We should like to see—in the suburbs, at least—corner sites, now partially occupied by buildings, protected from greedy speculators—that is to say, that the grounds outside the house, and bordering it on both fronts, be kept open or preserved from building. The County Council have power to prevent the old boundaries being built up to by determining the lines of frontage on both sides, and by throwing open to the public road so much of the site as may be required to widen the existing roads. This power they have by the new section secured, and it is to be hoped we shall see no more of those miserable corner turnings with shops brought out to the full boundary of the old site.

The question of the height of new buildings has been now settled. A new structure not forming part of a continuous block, and not being a rebuilding of a structure above 90ft., is fixed at that height, exclusive of two stories in the roof, gables, and ornamental towers. Higher buildings may be erected by consent, and the right of appeal by those who object to the ruling of the County Council is given to the new tribunal. We are very doubtful as to the wisdom of allowing so high an elevation. Practically, the height of 90ft. exclusive of roof means the erection of buildings of over 100ft. in height, and a proportionate degree of darkening and obscuration of light. Capt. Shaw's evidence in committee has been set aside, probably because the framers of the section saw that if they stated a less height builders and speculators would raise objections, and finally obtain what they wanted.

THE SOCIETY OF ARCHITECTS' SUMMER EXCURSION.—II.

FAVOURED with fair weather, the members of the Society of Architects found the latter part of their week's excursion even more enjoyable than the first few days had been. On Thursday morning an early start was made, and a train taken to Sevenoaks, where, after a short delay, they were met by three tumble-down brakes and horses to match. Possibly it was the pre-Adamite appearance of these vehicles which led to the strange reception which the party met with at Knole House. After paying—somewhat heavily—for admission, they were ushered by a stableman into the banqueting-hall, and left to admire the beauties (?) of the carved screen to its musicians' gallery for some time, before the pleasant Scotch housekeeper appeared to conduct them over the building. Thus the first impression of Knole was bad, and it was not greatly improved when sketching within the house was forbidden. Still, it was impossible not to admire the great, rambling place, with its huge courtyards, its gabled fronts, its chimney-pieces, and its plastered ceilings—the finest in Kent, if not in England—all speaking of the prosperous, stirring times of the 16th century. The extensive picture-galleries, too, contain works of art of great value; but unfortunately the masterpieces, though many, are far outnumbered by indifferent works, mostly copies. But the most noticeable feature is the massive repoussé silver-work of all descriptions. James I.'s bedroom—a room which, it is said, cost, even in his days, £20,000 to furnish.

After leaving Knole, the drive was over well-wooded slopes, through scenery of a rich but different description from that of the previous day, until the escarpment of the hills was reached. Here Mr. B. Harrison, the county grocer, who is one of the leading authorities upon flint implements, took the party in charge and led them at a rapid pace round the entrenchments of the ancient British camp of Oldbury. Its contents, he said, were no less than 125 acres, while its outline was essentially different from that of any Roman camp, following the natural outline of the hill. The only entrance was up a steep slope, made well-nigh impregnable by being guarded by a projecting spur of the escarpment, and close to this Mr. Harrison pointed out a cave which bore evidence of having been inhabited in the Early Stone Age—the Palæolithic period—when the inhabitants of these islands found their only shelter in the rocks.

A little further scramble and the inn was reached, and lunch partaken of. Then the party scattered, the sketching contingent gathering round the little "Town House" at Ightham—a half-timbered building of the latter part of the 15th century, unrestored, the cusped bargeboards hanging together nobody knows how, and the brick chimney, on its stone base and with its crenellated capping, asking for a prop in its old age. The house cannot stand much longer as it is, and all lovers of the picturesque who care to study the abodes of their forefathers should visit it at once. Ightham Church, too, is not devoid of interest, possessing a unique window in the north wall of the chancel, with stone pegs re-

ing right through as stops to the cusps, the ffect of which may be compared to that of lding gems to a rich gold setting.

Ightham Mote House being under repair, ermission to visit it had been refused. Some iembers of the party, however, wandered away o see it, and met the owner, who expressed his orrow at not having been able to receive them ll. They naturally asked him who was the rchitect for the restoration; but he said he had ot employed one, being satisfied that the people ho had charge of it were possessed of very good aste. A specimen of this taste is the wording f their sign-board, which announces, without unctuation, "Houses furnished and decorated n antique and artistic styles Oxford established 814 Designs and estimates free."

Most of the members, however, followed Mr. Harrison into his little garden, and subsequently nto the attic over his shop, to inspect his rare ollection of flint inplements, and listen to his nteresting description of them. He traced them ack through the various Stone Ages, from the ater and more polished forms of comparatively ecent times to natural stones just trimmed into orm by man—the very earliest forms, which had een first found and proved to be man's work by Mr. Harrison himself. These were found by im in gravel beds—the beds of ancient rivers, vhich now form the cappings of hills left after lenundation of the surrounding valleys to depths arying from 100ft. to 300ft., and many of them how signs of having been in glacier beds subse- uently to having been worked by man. Mr. Harrison said that even the most conservative eologists admitted that they proved that human eings lived in England 180,000 years ago! It vas with regret that, after tea, the members ook leave of Mr. Harrison, and travelled on to Ashford—where the parish church was lit up for he inspection of a few enthusiasts—and continued hence their pilgrimage to Canterbury, where they rrived late on Thursday night.

Next morning, the first place visited was East- gate Hospital—a simple building, mainly of the 5th century, but with a little Norman work in it. They stayed there only a short time, and then valked on to Westgate, over which they were onducted by Mr. F. Cross. The city surveyor, Mr. F. Baker, had many fine rubbings of brasses, aken by himself, hanging in the room over the gateway, which were much admired, though unfortunately nobody was present who could properly describe them. From the roof a fine iew of the cathedral was obtained, while upon he other side the attention of the visitors was lrawn to a 17th-century wrought-iron sign projecting over the footpath from the front of an ld inn. The cathedral itself, over which the arty were conducted by Mr. J. R. Hall, of ourse proved full of interest, especially to those vho had not previously visited it. The Norman nd Transitional work, all that eastwards of the ransepts, was, Mr. Hill said, built in the years etween 1189 and 1199. Its French character vas much noticed, its converging lines towards he east, to obtain an appearance of great length y false perspective, its acanthus carving, and he unusual four-centred arches. Before leaving, he library, cloisters, and chapter-house were isited, and then the Mayor, Mr. W. W. Mason, oined the party, and went with them to lunch. Afterwards St. Augustine's College was visited, nd the members were received there by Mr. Ewell, in the absence, through illness, of the Warden. Partly within the grounds, and partly without, are found the ruins of St. Pancras Church, of which a plan had been prepared for nspection by Mr. W. J. Jennings. This shows learly the different periods to which its walls an be ascribed; but much indignation was aroused on its being found that the chancel portion, n which many of our Saxon princes must have worshipped, is now used as a pigsty by an un- appreciative pork butcher.

Mr. Bowen next met them at St. Martin's Church, and conducted them over that pretty little structure. The font, with its ribbon orna- ment formed of dots between two rolls in an interlacing pattern, he ascribed to two different periods; but this explanation scarcely satisfied the visitors, who would have liked a geologist's opinion as to the different characters of the stones of which it was built before accepting it.

On their way back to the hotel to tea, several members visited the Castle Keep, now used as a coal store by the gas company. No doubt it serves his purpose admirably; but probably it would be better cared for if put to a less practical use.

After tea, a formal meeting of the Society, to which many of the townspeople had been invited, was held in the Guildhall by kind permission of the Mayor, who opened it by a few words of kindly welcome, and passed round the city mace and sword for inspection. Then followed the usual nominations for election in November next, and the ballot for gentlemen nominated for election two months ago, all of whom were elected. The President, Mr. Robert Walker, A.M.Inst.C.E., of Cork, who was in the chair, announced the death of Mr. A. T. Williams (member), whom he had known personally, and a short sketch of whose career he gave; and then called upon the secretary to show a series of photographs which he had taken during the week, and which Messrs. E. and G. Fullagar, photographers, of Canterbury, had converted into lantern slides in time for the meeting, *con amore*. The hall attendants, unused to the lantern, caused a little delay by bad management of the gas, but when this was put right the views appeared one by one, recalling the events of the past few days to those who had accompanied the party throughout, and showing to the others present, and the Canterbury residents who were there, what had been done. The pictures were generally excellent, and it is understood that copies may be obtained at a moderate rate through the secretary of the society. When the views had all been shown, and the free and easy lecture ended with which they were accompanied, the President made a short and happy speech, introducing several traditions about Canterbury and the neighbourhood, with which even the residents were unacquainted. A vote of thanks to all in the locality who had assisted the Society was proposed by Mr. G. S. Bridgman (vice-president), and seconded by Mr. W. Allport (member of Council), to which Mr. J. R. Hall replied, and this was followed by a special vote of thanks to the Mayor, proposed to Mr. G. A. T. Middleton, and seconded by Mr. S. C. Johns, to which he replied, and after which the meeting broke up.

Saturday was to see the end of the excursion, and in the morning a greatly-reduced party—not many more than twenty—travelled on to Dover, some being left behind to sketch at Canterbury, and others to return whence they had come. A large brake met them at the station, and in it all managed, with some difficulty, to squeeze, even finding room for their excellent guide, the Rev. Canon Puckle, as they drove up the hill. At the Castle entrance they were met by Mrs. Montgomery Moore, the General's wife, who received them most kindly, and conveyed to them the General's permission to photograph and sketch objects of architectural interest, a permission which, rarely given, was highly appreciated. Canon Puckle first led them to the base of the Roman Pharos, pointing out the evidences of its Roman origin, but he could scarcely have been right in saying that Roman mortar was made of lime alone, for it was full of a coarse grit; nor in stating that bricks equal in quality to those used by the Romans could not be turned out of modern brickfields. Probably the neighbouring church, which he next described, was of greater interest to the visitors, who listened attentively to the narration of its history, and noted the construction of the British semicircular chancel arch—the tiles of which, of imitation Roman make, converge to a point far below the centre of the semicircle—and that of the beautiful 13th-century vaulting and bosses of the chancel; while the recently added termination of the tower called forth uni- versal execration.

The strange and beautiful Transitional detail of the oratory in the Castle keep next called for admiration, the noticeable feature being the placing of the dog-tooth ornament on the roll and pointing across the hollow. The Warden, coming forward, conducted the party then through the armoury, while the President and a few others accepted Mrs. Moore's invitation to inspect the General's private rooms.

Returning down the hill, Canon Puckle led his following into his own church of St. Mary, and most interestingly described its history as traced by him. He showed where the walls of the Roman bath originally came, how far the Saxon church extended, and how far the Norman, with its exactly similar detail and different construction. The tower arch is of most unusual form—horseshoe, with jambs wider apart at the springing than at the floor level, as if it had been copied from a semi-circular arch which had had abutments unequal to the resistance of its thrust. The Canon also described his discovery of an embalmed body, laid in sanctuary but not buried, beneath the flooring of the church, which he and others had been compelled to consider as that of King Stephen.

In the afternoon a visit was paid to Dover Priory, when Dr. Astley acted as leader—and with this terminated a most interesting and enjoyable excursion, not marred by a single hitch, though the party was large throughout, and the arrangements had originally been made for a much smaller number.

BERLIN ARCHITECTURE.

THE *Wiener Bauindustrie-Zeitung* calls atten- tion to the extraordinary improvement which has been made within a few years in the architecture of Berlin. Not long ago Berlin was distinguished by the meanest architecture in the world. Its buildings, large, but ill-proportioned, were universally constructed of brick, plastered on the outside with stucco, and diversified with belts, or cornices, of great projection, made of wooden furrings, feebly secured to the brickwork, and covered either with zinc or plaster of Paris. Occasionally ornaments cast in stucco, or modelled by hand, were used to decorate a window or a frieze, but the use of real stone was alleged to be out of the question, on account of the distance from which it must be brought, while the rational use of brick was never, apparently, thought of at all. With the advent of the pre- sent generation of architects it began to be found out that the use of stone was not wholly impra- cticable, even in Berlin, and that in the end it was quite as economical as the perishable stucco. The first stone employed, as might have been expected, was worked by the native stone-cutters in any- thing but an artistic style. Not having any idea how cut stone ought to look, they rubbed and scraped it into as close an imitation as possible of the stucco to which they were accustomed; but it was at least solid, and, from the necessity of the case, they were obliged to retrench the pro- jection of their stone stringcourses and cornices. By degrees, through the exertions of the archi- tects, the practice of stone-cutting was improved, and tooled faces and rustic joints began to give character to the exterior surfaces, while real sculpture, well designed and well executed, came into use. Not content with this, the architects undertook to use brickwork frankly. They hunted up Mediæval examples, of which there were plenty to be found, and imitated them, adding such modifications as their taste suggested, and now the North German brickwork is perhaps the most interesting, from its variety and ingenuity, of all the manifestations of German architectural skill.

NOTES ON BUILDING PRICES.—VIII.

By John Leaning.

GENERALISATIONS AS TO COST OF BUILDINGS.

THE desirability of some rules by which the approximate cost of a building may be arrived at before it is built has been felt by most persons engaged on its production. This is a branch of investigation which may reasonably be alluded to in this connection. The best known and most generally used method is by calculation of the cubic contents. Measuring the length, breadth, and height from the top of concrete to half-way up the roof, multiplying the dimensions together and pricing the content thus arrived at by a price per foot cube.

Another method is roughly taking out the quantities and pricing the items, as described in Leaning's "Quantity Surveying."

Professor Kerr, in his "English Gentleman's House," estimates cost per square.

The method of calculation is to take the dimensions of every room and portion of the house internally, multiplying their relative length by the breadth. Then squaring the floor-spaces of the passages and stairs in the same manner, and adding to the total one-fifth of the whole for walls and waste. To all the results obtained by estimating the cost of the house by the number of superficial squares must be added an allowance for incidental expenses. These would be professional services, including law charges, special fittings (grates, mantels, and the like), external fences and boundary walls, and some internal decoration, and should not be estimated at less than 20 to 25 per cent.

Professor Kerr's Table of Approximate Cost of Buildings.

Fees of Quantity Surveyor, Local Authorities, and sundry other Fees, &c.	250					265					19	
					£5,624	Nearly 12½ per cent. advance on 1865.					624 5,000	
	£5,000	£5,000									£5,624	

As to cubic value, Professor Kerr says, a well-built residence is found to cost as follows. Per cubic foot:—

For the main building or family department ..... 8d. to 15d.
For the attached offices or servants' department ..... 6d. to 10d.
For stables and farm offices ..... 4d. to 6d.

Mr. Wheeler, in his "Choice of a Dwelling," 1872, recommends calculation by the square, including the walls, and some of his opinions as to the value are as follows:—

A first-class house in London not exceeding 1,800ft. super. per floor, that is, 30ft. by 60ft.

Principal rooms ..... £50 per square.
Chambers and secondaries ..... £35 ,,
Offices ..... £25 ,,

A well-built London or suburban residence, not wholly detached, and not exceeding 900ft. super. each floor, or 22ft. 6in. by 40ft.:—

Principal rooms ..... £40 per square.
Chambers and secondaries ..... £30 ,,
Domestic offices ..... £20 ,,

A London or suburban residence, plainly but honestly built, as an investment or for a very moderate scale of living, and not exceeding 900 superficial feet each floor:—

Principal rooms ..... £35 per square.
Chambers..... £25 ,,
Domestic offices ..... £18 ,,

The bare price per foot cube of a building, unless one knows the character of the work, is of little value; but notes of the contents of any building, with particulars of the nature of their finishings and materials, should be kept by the student, and such data will prove valuable for purposes of comparison. A few rates are given below:—

	s.	d.	
Labourers' cottages	0	4	per ft. cube.
The cheapest dwelling houses about	0	5	,,
The best mansions.....	1	6	,,

Place.	Name of Contractor.	Cubic contents.	Lowest tender.	Per foot cube.	Provisions.	Excavating and Draining.	Bricklayer.	Mason.	Slater and Slate Mason.	Carpenter.	Joiner.	Gasfitter.	Plasterer.	Founder and Smith.	Plumber.	Glazier.	Painter.	Bells.	Preliminary.	Surveyor and Lithographer.
House at Oxford.		93,318	£3,837	9¾d.	670	101	800	496	155	407	314		177	268	191	73	45	4	47	89*
House at Kensington.		111,654	£4,764	10¼d	399	144	1228	555	61	331	882	18	276	222	240	91	110	29	51	127†

Remarks.—* Brick walls faced with coursed rubble, roof of stone slates, stone windows, with mullions and transoms, iron casements, deal joinery. Three miles from a railway station. Roads "uphill" all the way.
† Blanchard's red facings, Portland stone strings and cornices, about half the slating green Westmoreland, joinery deal, electric bells.

	s.	d.	
Very good country houses may be built for.....	0	10	per ft. cube.
Stables.....	5d. to 1s.		,,
Breweries	0	5	,,
Maltings	0	2½	,,
Churches (some as low as 5d.)	0	6	,,
Lunatic asylums have been built (per patient £140)	0	6	,,
Do. wards alone	0	4½	,,
Mr. Street's design for St. Mary's, Edinburgh, was estimated at	1	0½	,,
Warehouses	5d. & 6d.		,,

Mr. Young's preliminary estimate for Glasgow Municipal buildings was: basement, 9d.; superstructure, 1s.; towers (above last), 1s. 6d. Mr. Corson's estimate was 1s. throughout.

Messrs. Leeming and Leeming estimated their design for the new Admiralty buildings at 1s. for the main building, and 1s. 6d. for towers and work above parapets.

The cost of some well-known buildings has been as follows:—

	s.	d.	
Manchester Assize Courts	0	9½	per ft. cube.
Foreign Offices	1	0½	,,
Houses of Parliament	2	6	,,
Waterlow's Industrial Dwellings, average	0	7	,,
British Museum.....	1	6	,,
Do. recent additions.....	0	10	,,
Royal Exchange	0	11	,,
St. Thomas' Hospital	0	9	,,

Labour and material have risen in value since most of the foregoing were built.

Buildings of the School Board for London, 1870 to 1880, 5½d. to 7¾d.; 1880, 6¼d., not including boundary walls or playgrounds.

Some more recent examples are as follow:—

	s.	d.	
Hotel Victoria, Northumberland Avenue	1	6	per ft. cube.
Holborn Viaduct Hotel	1	4	,,
Holborn Town Hall.....	1	2	,,
Railway clearing house, Seymour-street, Euston-square.	0	6½	,,
New post office, St. Martin's-le-Grand (corner of Newgate-street)	0	8½	,,
Bow-street Police-station	0	11	,,

Other methods of calculation have been adopted, as the price per scholar for schools, per bed for hospitals, per sitting for churches and chapels.

Breweries per quarter—i.e., the quantity of malt that can be dealt with at one brewing, including machinery and plant, and exclusive of malting or cooperage, the approximate cost is as follows:—

5	Quarters	£500 per quarter.
20	,, ...	400 ,,
40	,, ...	350 ,,
100	,, ...	300 ,,

See also "Breweries and Malting," R.I.B.A. *Transactions*, 1872.

Schools cost from £4 to £10 per scholar. The London Board Schools have cost for the buildings about £10 15s. per head from 1870 to 1880.

Hospitals per bed:—

St. Thomas's Hospital.....	£650
Do. one pavilion without administrative buildings	250
Herbert Hospital, including administrative buildings	320

Workhouses:—

West London Workhouse, Holloway, per inmate	£48 (Tarbuck)
St. Pancras Infirmary, Highgate, per inmate	68 ,,
Chorlton Union Hospital, per inmate, under	50 ,,

Churches per sitting: Minimum £4; of the highest class, £10 to £12.

The proportion of carcase to total cost of a building is about one-third—i.e., one-third carcase, two-thirds finishings. The total cost of a building is approximately (a little more than) three times the cost of the brickwork for buildings of the commonest class; but for buildings of average quality five times the value of the brickwork, or four times the bricklayer's bill.

Record of the proportion of the cost of work in each trade may advantageously be kept by the student in some such form as follows. Examples from actual practice are given in the above table.

The proportion of labour to material is a subject of investigation which the student of prices may pursue with advantage. As an indication of what may be required of the expert, the following table from "The Rise of Wages in the Building Trades of London" (R.I.B.A. sessional papers 1877-78) may be useful. The paper was prepared by Mr. Stephenson (Hunt and Stephenson) to compare the cost of re-erecting a dwelling-house in 1875 with the cost of its erection in 1865.

The estimator will find himself but imperfectly prepared for his work if he has not previously acquired the art of taking off quantities with reasonable facility; such practice is an admirable training of that analytical faculty which good pricing requires, and he should accustom himself to value in accordance with the best system of measurement he may know. The best systems were framed and adopted with special view to that end.

Notes of the number of rods of brickwork, compared with the cubic content of the building, may be preserved with advantage. A few notes

of this kind, from a recent paper read by Mr. Rickmam, may be useful:—

	Content in cubic ft.	Rods of reduced work.
A University building of monumental character ..	1,010,000	1 to 150
A country house	160,000	1 ,, 1,600
A London club house.....	2,270,000	1 ,, 1,849
A set of insurance office buildings	527,000	1 ,, 1,850
A hospital.....	3,250,000	1 ,, 1,184
A country house	392,000	1 ,, 1,912
Ditto.	300,000	1 ,, 1,962
A paper warehouse.....	400,000	1 ,, 2,090
A set of residential chambers	386,000	1 ,, 2,100
An hotel	4,000,000	1 ,, 2,296

Such an investigation might be pursued as to the proportion of beds and joints, and other labours to a given quantity of stonework, according to its character, cubic feet of timber, yards of plastering, &c.

Records of such information as the above are of use in the scrutiny of a bill of quantities before sending it out. A surveyor will frequently be surprised by the quantities in his bill, and will need some such data to reassure him.

ALLOWANCE FOR SMALL QUANTITIES.

Work in small quantities is worth more than in large quantities; builders in pricing and estimating usually increase the price by 20 to 25 per cent., and this probably covers the extra cost as far as a general rule can, as if applied throughout the bill one error will balance another; but it is better to take each case on its own merits, and the percentage may reasonably vary from 10 to 50 per cent. It requires considerable experience to decide what this percentage shall be, and when it shall be added.

MATERIAL IN DAY ACCOUNTS.

The argument for an increased price for all the material charged in day work account is often a fallacy; in many cases it costs no more to supply material in small quantities than in large, increased cost is after all the only reason for allowing a higher rate.

METHOD OF BUILDING.

Intimately connected with the question of the cost of a building, is the method adopted for its erection; the relative advantages of various methods are, in the order following, the cheapest and best first:—A contract on quantities, a contract without quantities (on drawings and specifications), on a schedule of prices, purchase by the building owner of materials, and employment of workmen supervised by his clerk of works.

FEDERATION OF AMERICAN ENGINEERING SOCIETIES.

An attempt is being made to affiliate the various American Societies of Engineers, and suggestions for a general organisation of the profession have been published by the Western Society of Engineers, who are endeavouring to unite in this object with the American Society of Engineers. Several plans have been proposed by the latter body for the formation of local associations, and these are published in the June *Proceedings*. These plans generally propose branches under certain rules, the absorption of local societies as chapters of the American Society, yet holding the individual interests of their members. The plans belong to two classes, affiliation plans and federative plans. The Western Society say: "The preference of our Committee is for some kind of organisation which will afford the advantages both of affiliation and federation, and which will build up one strong homogeneous society, open to all the members of the profession under their appropriate grades, provided that this can be organised so as to recognise in some way all the existing local societies and their membership, and preserve the autonomy of the societies, and foster the local meetings that have been found so valuable as to lead to the increasing organisation of engineers' clubs, even when the members were already connected with the American Society of Civil Engineers." The suggestions for a general organisation of engineers follow, and are based on the principle of allowing the local bodies to have their own local by-laws, provided they do not conflict with the general by-laws of the association, and that there be a representation of each branch in the general board of direction. The value of a federation of the societies cannot be doubted if each society has its autonomy and individuality preserved, and is represented on the general council.

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XII.

By Banister Fletcher, Jun., A.R.I.B.A.

THE ENTRANCES IN THE 30-METRE GALLERY.

Starting from the dome, we come, firstly, to "Orfevrerie," and one remarks at starting what a large part colour takes in the decoration throughout the gallery; colour is predominant everywhere, and in general with harmonious effect. The designs to these entrances are all of them endeavours to symbolise the products of the different sections exhibiting, or at least to give a design whose characteristic idea or "motif" should convey an idea of the class represented.

Orfevrerie is designed somewhat differently from the others, inasmuch as the entrances are at the side, whereas most of the others are in the centre. The design consists of two large semi-circular arches resting on circular columns, painted an azure blue, which inclose a smaller bay, ornamented with arabesque, &c., on a white ground. The two large arches, right and left, are flanked with escutcheons of the old Goldsmiths' Guilds of Paris, Lyons, Limoges, and Tours, and are inclosed under an architrave frieze and cornice, on which rests an attic composed of small columns and semi-circular arches. In these small divisions, on a dull gold ground, are painted the names of the principal French goldsmiths of all time.

Bijouterie.—The exhibitors of this class have evidently thought that the way to characterise their entrance was to use architecture as a framework on which to paint symbols of jewelery—cameos set off with gold and intermingled with wreaths and garlands, vases enriched with imitations of precious stones, all painted with a key-note of pink, grey, and gold, serve to symbolise the section exceedingly well.

Crossing to the *Céramique Section*, we find, as might be expected, that the architect has taken advantage of the material itself to be represented, and has worked it into his design. The grouping consists of a semi-circular headed entrance doorway, with a statuette on each side treating of the History of Pottery, inclosed in a niche by small glazed faïence columns and pediment, &c. On each side of the entrance are two semi-circular arches on a central column. Above these are worked in very cleverly a series of eight panels, representing the various processes in connection with pottery, delineated in plaster. The colouring is exceedingly harmonious, and the general appropriateness of this entrance is very self-evident.

Opposite this entrance is that to the "Habillement des deux Sexes," which, of course, has to rely on painting. It is peculiar, however, to notice that the women introduced into these fresco paintings have as little of that necessary article to which this entrance is put up as is generally considered sufficient.

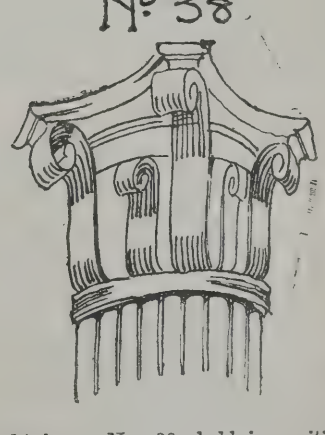
We now come to the two contiguous entrances designed by M. Hermant, the architect of the Portuguese Pavilion—namely, that to "Meubles" and "Tapissiers and Decorateurs." That to "Meubles" is probably one of the most satisfactory of these compositions, both as regards "motif" and composition. It is executed in plaster, coloured to imitate a dark brown wood (say dark oak), and is conspicuous against the light colouring to the surrounding doorways. There is a square-headed central entrance, draped, and on each side a bay with a low three-centred arch. Over each of these is a bas-relief in burnished plaster to imitate wood, and having on each side circular columns of a wooden type. On the face of the four piers dividing the façade are four figures, also in burnished plaster, representing respectively a wood-carver, a cabinet-maker, a designer, and a decorator; and above the levels of these, and separated by the consoles supporting the cornice, are painted the names of celebrated wood-carvers and designers, amongst which one notices Jean Jonjou, Boule, Le Pantre, Du Cerceau, Delafosse, Riesnier, and Carlin. The effect is satisfactory with its rich, sober, monochromatic colouring.

The next entrance is that to "Tapissiers and Decorateurs," also by M. Hermant, who seems to have this more difficult to treat. It is designed in Louis XVI. style, in plaster, in imitation of marbles (keynote red and green). Two compositions at the sides, by Toché (who also painted the frescoes to the Retrospective Exhibition), alone reminds one of the "motif" of the doorway which is to symbolise the art of the "upholsterer." Retracing our steps on the other side we come to the entrances to "Silk" and "Wool and Cotton."

The entrance to "Wool," &c., has a very rich central "motif," with twisted columns and pediment, and a seated figure supported on a corbelled base.

The entrance to "Silk" the architecture takes a second place, the spaces being filled up with painted canvas representative of the industry symbolised.

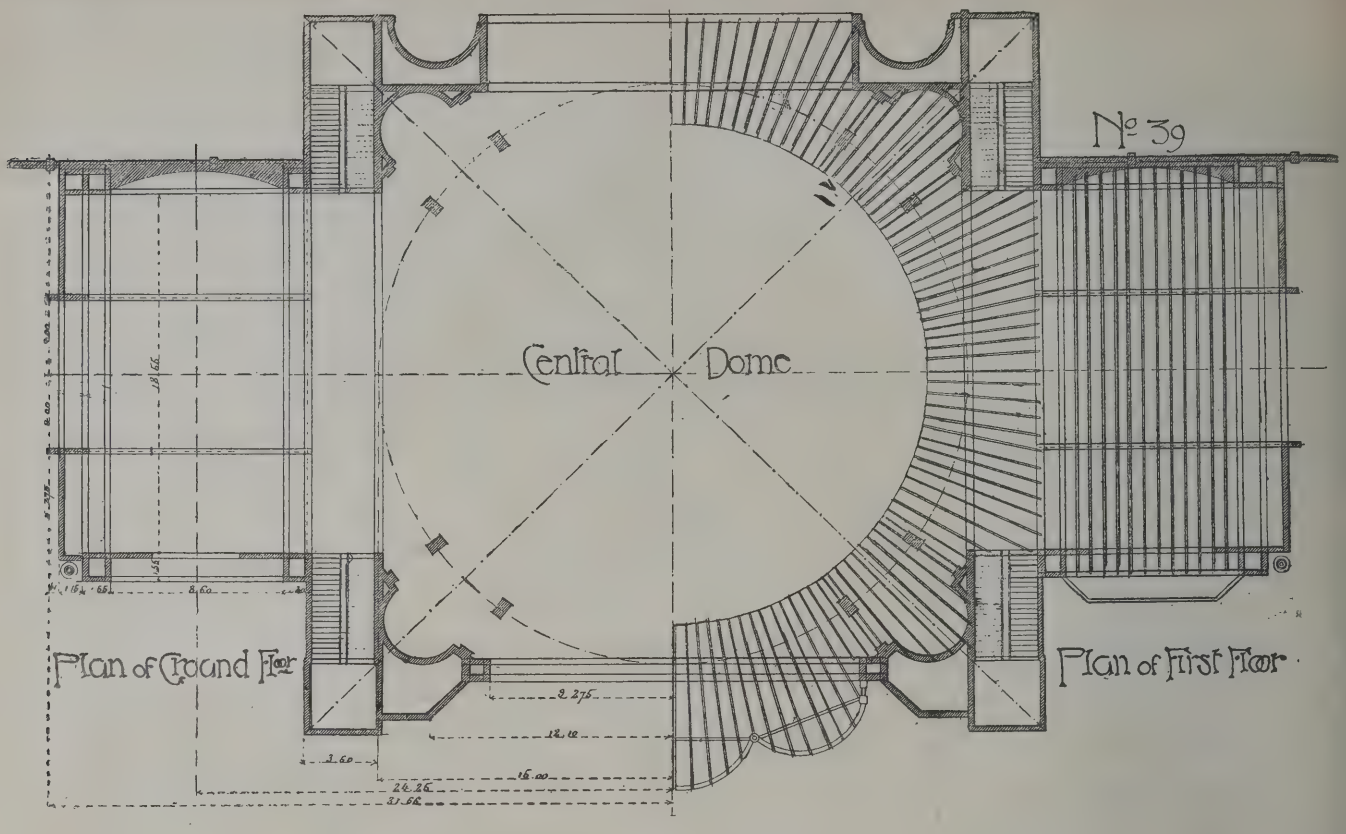
The "Armourers" Section, which might have been expected to have given us something extremely representative of their art, have only a few groups of armour, and a cavalier painted on a background of gold, to recall us to the fact that we are entering their section.



Classes 42, 43, 45, and 47 ("Forestry, Hunting, and Fishing") is a characteristic front entirely of wood. In the centre is a ship's prow, and ornamented in the semicircular arch from top to bottom with a crocodile on a gold ground (the ship's prow is fitted with oars and cables, &c.). The other ornamentation consists in the frieze over the side opening with skins of beasts and stuffed animals, which, although appropriate to the opening, are not architectural in any sense of the word.

The entrance to "Horlogerie," opposite, is as suitable a framing to an entrance of watches and clocks as could well be imagined. The design is said to have been founded on the "Vieille Horloge" at Rouen. There is a central entrance and two side bays. At the top of the central composition there is a silver bell, then the hour sand-glass, and inclosed under a tastefully-designed pediment a clock, right and left louvre-boards, and then bronze bells; over the side bays on each side are semi-dials, with the moon and golden stars on a sky-blue ground; below are other symbols of horlogerie. Starting from the key-stone, as it were, of the side bays, and describing a semicircle in an immense dial with the hours marked on. This is, of course, very much out of scale, and spoils the rest of the composition, which is exceedingly graceful and well thought out.

Passing the entrance to "Bronze et Fonte d'Art," in which the application of bronze in architectural work is exposed, we come to



THE ENTRANCE TO THE MINING AND METALLURGICAL SECTIONS.

M. Schmidt is the architect, and it seems to be a marvel of workmanship. It is composed of forged iron made at the works at Pompey under the architect's direction. It is composed of a central arch bigger than the side arches, of semi-circular form, made up with a lattice-work arrangement of flat irons and implements. The arches rest on circular hollow columns composed

of upright irons, No. 38, held in position by bright iron bands, which also form the uprights into an entasis. The ironwork is left a natural colour, and the only relief is where it is polished. It is exceedingly well executed, because they say it made up of ordinary sections, or sections made with ordinary machinery, which will be sold as such at the end of the Exposition. There is nothing, not even a painting, in this façade, which is only iron, and yet one can look at with as much pleasure as on its neighbours, with all their frescoes and colour, which I have been describing.

Opposite this is the entrance to the Class 41, which is also exclusively decorated to the products of the group to which it forms the entrance. For instance, the columns are of cannons, and

groups of implements which are used in diggings for mines and working them, also decorating the arches themselves. In the parapet above the main cornice are cannon-balls and shells, with chains from lion's mouths falling down between.

This is the end of the entrances to the various sections, and one way, and that in many instances, at least, they are as novel as they are pleasing, imbued as they are with a sense of fitness, which, in installations of this kind, French architects seem so thoroughly at home.

THE "DOME CENTRAL" OF THE PALAIS DES EXPOSITIONS DIVERSES.

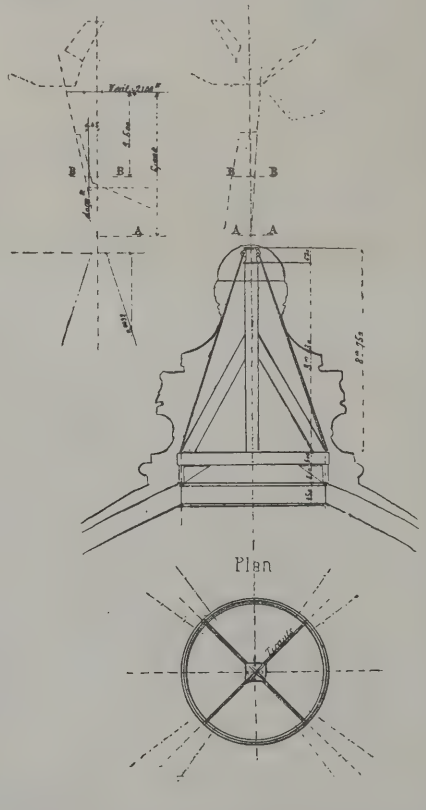
I have to acknowledge my indebtedness to M. Bouvard, the architect of this magnificent dome, and also M. Ulysse Gravigny, his "premier inspecteur," for much of the information contained in the following pages, and also for an interior photograph showing the dome in conjunction with the restaurant galleries, and an interior photo from a water-colour sketch, showing the construction of the pavilions; this latter I attached to my report. In my description I must translate largely from a long letter kindly written to me by M. Gravigny.

The dome itself was commenced on the 31st of October, 1887.

The monument entrance to the Palais des Expositions Diverses, and really the principal entrance to the Exposition itself, comprises a central nave flanked right and left with two pavilions, the framework of the whole being in ironwork. For general disposition see No. 39 from *Le Génie Civil*.

The dome itself is formed by eight half-trusses, supported by eight standards 130ft. high. The iron standards are held in position by three circular rings (No. 40 from *L'Architect*).

The two lateral pavilions serve also to bind the dome to the adjacent galleries.



The top of the dome is at 60 mètres (196ft.) above the level of the ground.

At the first floor, 32ft. above the ground, is formed a circular balcony, which is reached by four staircases situated in the corners on plan; this balcony communicates right and left with two pavilions, which on the first floor were used for conference rooms. From this balcony, which abuts on circular projecting galleries on the central entrance, is obtained a fine view under the great legs of the Eiffel Tower, and the Trocadero beyond, as also on the other side a fine view down the immense "galerie de 30 mètres," with its entrances on either side full of colour and feeling right to the circular dome forming entrance to the "Palais des Machines."

At the height of the first circular belt of ironwork, that is to say, at about 72ft. from the ground, the main coupled standards are brought together (see No. 40 from *Le Génie Civil*), as it were, in pairs by pediments, with sculptured "motifs" representing the four principal agents of production—L'Air, L'Eau, la Vapeur, et l'Electricité, by MM. Bourgeois, Plé, Pècon,

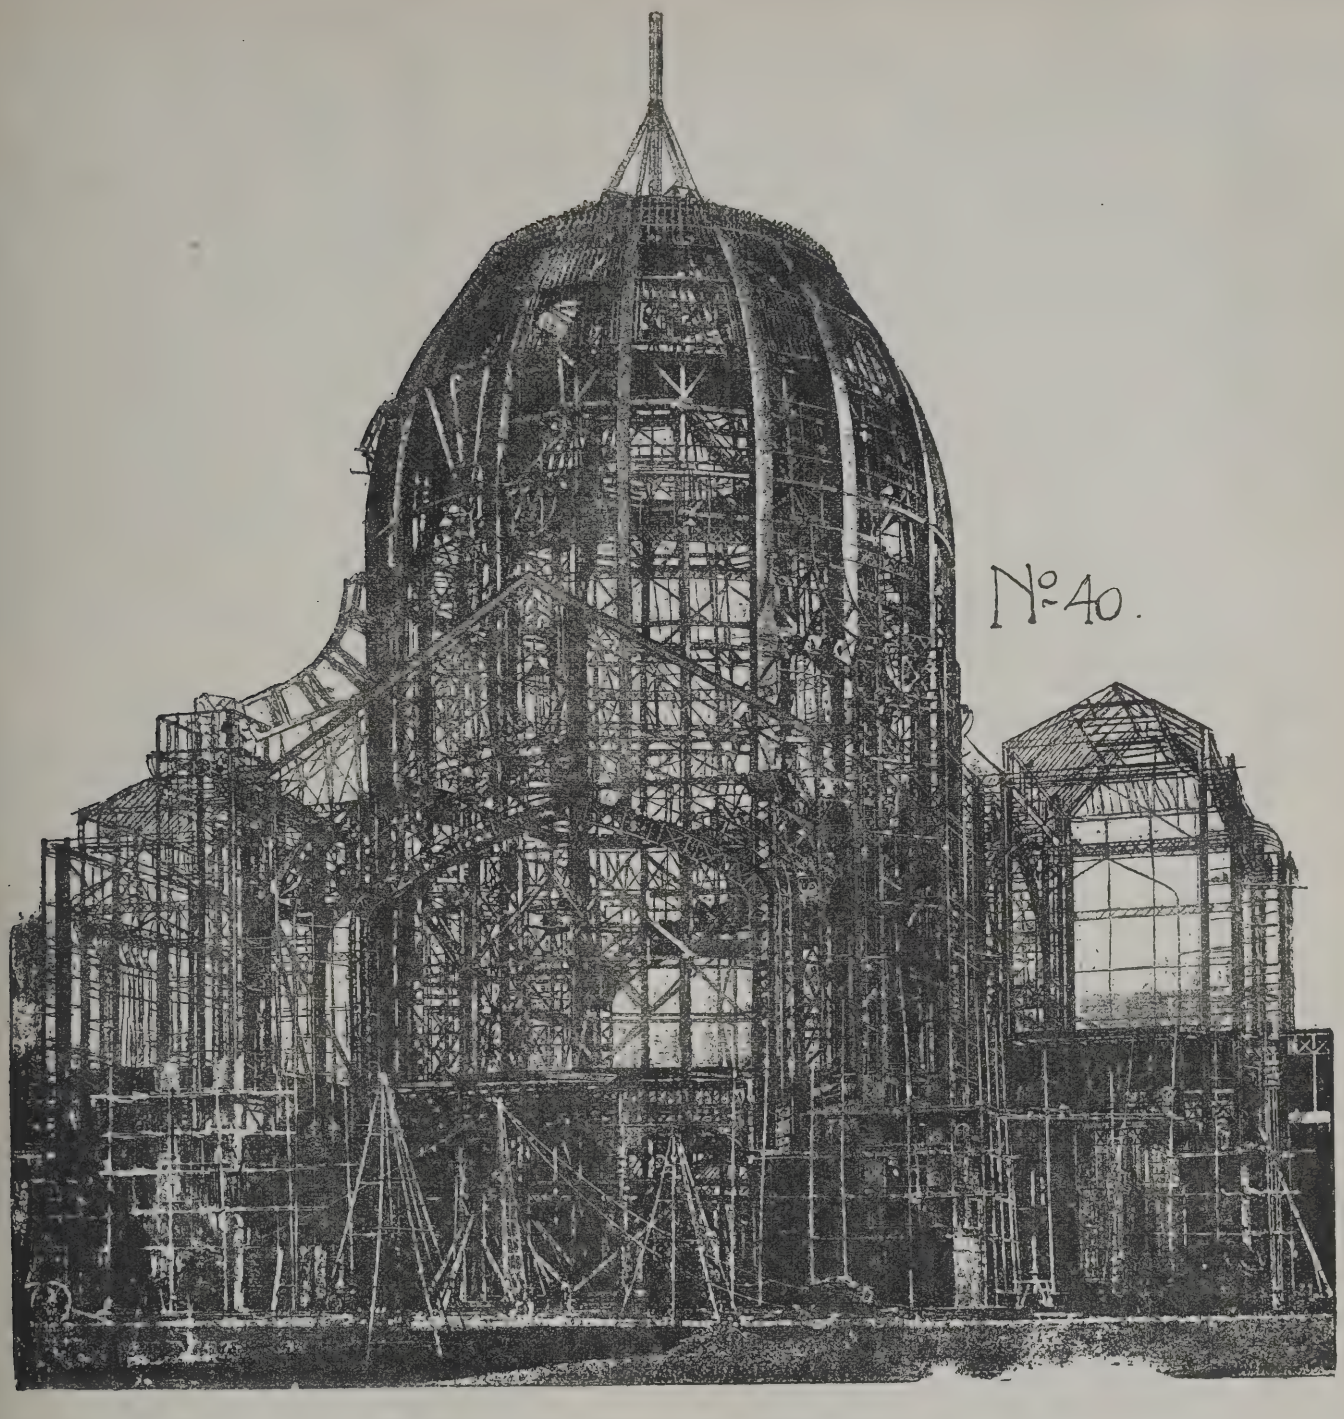
Nº 41

Projection verticale de profil. Projection verticale de face

and Desbois. These pediments, I ought to mention, are supported by pilasters, backed against the trusses, containing between them a large shield, with the initials "R.F." inscribed in the centre.

Between the first belt and the upper cornice, a deep decorative frieze, 20ft high, runs round the interior of the dome, and represents France inviting all nations of the world to the Exposition, and receiving at the same time the products of the entire world. This is painted by MM. Lavastre and Carpezat in 12 panels, 20ft. high. Four inscriptions between the pairs of main principals bear the names of those nations who accepted the invitation of the French Republique.

Above the height of the third belt are allegorical sculptures of Europe, Asia, Africa, and America, MM. Delhomme and Cardonnier, sculptors, continuing the principal constructive "motif," finishing with painted panels relating to these four great continents of the world.



The trusses are bound together by the crowning cornice, with blocking course containing the shields and coats-of-arms of all the Powers represented at the Exposition.

The light to the dome is admitted by twelve large glass windows placed between the principal trusses. At the top, the French flag forms the centre of the ornamentation, from which escape, as it were, golden rays on a deep blue sky studded with silver stars.

Exterior.—The constructive lines of the dome are accentuated in tones of florentine bronze, picked out with lines of gold, carried up to the summit, on which is placed a statue 29ft. 6in. high, representing France distributing laurels, &c. This statue, erected in zinc "repoussé," by M. Coutelier, after the plaster model of M. Delaplanche, is supported on a skeleton of cast steel (see No. 41 from *Le Génie Civil*). The skeleton was made by MM. Moisant, Laurent, Savey and Co., and is fixed to the metallic framework of the dome. The total weight of the statue and its framework is 157cwt., or 7tons 17cwt.

The skeleton in steel is composed (see No. 41 from *Le Génie Civil*) of a central shaft starting the bottom of the left leg and going to the top of the head; from this central shaft are a series of secondary arms, upon which are fixed the framework for the different members of the body and the wings. The framework, &c., has been calculated to withstand a pressure of wind equal to 70 kilogrammes a square mètre, or about 154lb. to 1·196 square yard.

In the following lines is explained the manner employed for the fixing of the materials which have served for the decoration of the dome, and firstly, the materials employed are zinc, glazed terracotta, concrete or béton, in various colours, and "staff" or canvas plaster. The interior is decorated with painted canvas "à la colle" and "staff." The methods employed for fixing the different materials and "motifs" are the following:—

The statue in stamped zinc placed at the top of the dome is fixed as mentioned above by the interior framework; the fixing in position was accomplished in small portions, and the rigidity assured by dint of connecting bolts. The ridge, as it were, above the glazing, formed with lions' heads at the top of each half-truss, is also in zinc estampé, fixed upon the woodwork forming the cupola, and held to it by means of bolts, irons, &c. At the springing of the dome, and between the pairs of standards at the four angles, are placed four griffins, which are firmly fixed to the interior of the dome by braces in wood, and fixed to the face of the dome by angle irons; they are made in staff. The drum of the dome is formed with bricks "apparentes," and ornamented with bulls-eyes in glazed terracotta. These bulls-eyes are fixed to the iron framework. The "motifs" in "staff" which have been employed throughout in the decoration of the great entrance below the dome are placed and secured to the irons forming the great arches, &c., by metal straps or bands, or by iron network bedded in plaster. The coloured concretes in the base are secured to the brickwork by means of cramps and ties. In the interior, the "staffs" are fixed in the same manner as the exterior. The decorative canvases are lined and fixed by the aid of glue. The general grouping of this great entrance and dome is pleasing, and the outline of, the dome itself is very fine, but the lines of the entrance arch and pediment over are not happy, and the details of this part are anything but refined, and the enormous statue 30ft high at the top completely destroys the scale. By covering this up on the photograph, one sees this directly. The entrance evidently had to take the outline of the "Galerie de Trente Mètres," or vice versâ.

As it is necessary to emphasise very strongly the part which colour plays in the decoration of the dome, without it, its outlines in the distance would still be grand, but internally it would lose much of the grandeur of effect it now possesses. The architect has evidently relied to a great extent on colour for his effect. The dome, however, may be said to be a most impressive composition, well worthy of forming the main entrance of this great Exposition.

ARTISANS' DWELLINGS.

At the Sanitary Congress at Brighton, on Aug. 28th, Mr. Francis Hooper read a paper on "Artisans' Dwellings." He said he had observed with anxiety the spreading fashion for the erection of so-called model tenement dwellings. No doubt many economies were effected by making one drain, one staircase, one roof, and one water and gas service suffice for many; but when defects occurred, or disease arose, the evil was suffered by all. He put forward for consideration the question of tenant proprietorship, mentioning that in the north of England facilities for purchase had been largely taken advantage of by artisans, and had proved eminently beneficial in the encouragement of thrift, sobriety, and self-respect. He expressed the view that though tenement buildings, when well constructed, with due attention to sanitary details, were a satisfactory solution of the problem of housing large numbers of persons in a limited space, for the relief of congestion of the population the railway service to outlying districts by cheap trains must be extended.

It is stated that the Jezreelites, or the "New and Latter House of Israel," have just settled the claim of the builders, Messrs. J. S. Naylar and Son, against them for £6,000 by tranferring to the builders over six acres of land and the extensive range of buildings known as Israel's Training College. Messrs. Naylar have consequently dropped the action which they had commenced in the Chancery Division. The gigantic temple of the Jezreelites still remains unfinished and roofless.

SALE PUBLIC LIBRARY.

This building is to be erected in the centre of this Manchester suburb by public subscription, and handed over to the local board complete and stocked with books, for them to maintain afterwards, the ratepayers having unanimously adopted the Free Libraries Act. The building will be faced with red Northwich bricks, with Rainhill stone dressings, and the roofs covered with red and green Penrhyn slates and red Ruabon ridge tiles. The half-timber work will be in pitch-pine, stained and varnished, and filled in with cement. The whole of the internal fittings are to be red deal and pitch-pine, stained and varnished. All the rooms will be heated with hot-water throughout, there being no open fireplaces except in the librarian's room, and special attention will be paid to the lighting contrivances, to insure the least possible injury to the books from the gas vapours, and the ventilation of the building, to secure the best results. With regard to the internal arrangements, it will be observed that the library and reading-room are on the ground floor, and though actually in one room, are so divided by the low partition that borrowers have no need to interfere with the reader's comfort in the slightest degree. By this arrangement, also, the librarian has full control of the whole floor, either from his place behind the counter, or from his private room, which is inclosed by a glazed partition the full height of the room. By means of private stairs, he also has direct access to both first floor and cellar without coming outside the counter, whilst he is further provided with lavatory and w.c. for his own private use. The bookshelves and reading-tables are all placed at right angles to the windows, so that the light has full play down all aisles and to all readers alike. The upstairs rooms are to be used for ladies' and gentlemen's reference libraries, all the wall-space being utilised for shelving, and light being obtained from large roof-lights. The plan of this floor speaks for itself, however, and requires no explanation further. Ample cellarage is provided for stores, heating apparatus, packing and unpacking books, &c. The work is to be commenced at once, and carried out under the personal superintendence of Mr. Robert J. M'Beath, architect.

ALMSHOUSES, WELBECK.

These houses are now being erected at Welbeck for His Grace the Duke of Portland, by the desire of the Duchess. The houses will be for the benefit of widows on the Welbeck Estate, and are built within a short distance of the Abbey, so that the occupants may receive Her Grace's personal care and attention. The materials used are Whitwell stone for the external walling, with Anston stone dressings; the roofs are covered with Staffordshire tiles. The drawing was hung in the last R.A. Exhibition. The architect is Mr. John Brooke, of Manchester.

TWO INTERIORS, KNOLE PARK, KENT.

Last Thursday the Society of Architects visited this historic mansion of the Sackvilles, near Sevenoaks, and to-day, as an accompaniment to our report of the proceedings on page 314, we publish two interior views from the building, showing the grand staircase (see Building News, August 20, 1886) and the "chapel room," which is hung with tapestry and filled with choice furniture. The chimney-piece in this apartment is somewhat similar in design to those removed from Lime-street, City, some seventeen years ago, and now in South Kensington Museum. In the Building News for November 23, 1888, we gave two illustrations of historic bedsteads from Knole Park, and with them we printed a lengthy account of the building. Our illustrations then, as now, were reproduced from some excellent photographs by Mr. Essenleigh Corke, of London-road, Sevenoaks, to whom we are indebted for permission to issue these copies to our readers. They form part of a beautiful series of prints taken with the special consent of Lord Sackville during the past year, and some of the views were exhibited at the last Exhibition of the Photographic Society of Great Britain in Pall Mall. The set comprises some 58 or 60 pictures of the house and its contents, forming a valuable monograph of this unique old mansion, which is to be visited by the Architectural Association on Saturday in next week, the 13th inst.

THE ROMAN CATHOLIC CHURCH AND CONVENTUAL BUILDINGS, OSWESTRY.

The buildings were erected by Mr. T. Longueville, of Llanforda, for the accommodation of his co-religionists in and around Oswestry, at a cost of about £4,000, and consist of a church, priest's house, and conventual school. The builder was Mr. W. Bowdler, of Shrewsbury, and the architect was Mr. W. H. Spaull, F.R.I.B.A., of Oswestry.

ST. PAUL'S PREPARATORY SCHOOL, COLET HOUSE, WEST KENSINGTON.

(See description on p. 343.)

CONGRESBURY CHURCH, SOMERSETSHIRE.

Soon after leaving Yatton, the terminus of the Cheddar Valley Railway, the traveller to Wells will notice on the left hand the well-proportioned west front and spire of St. Andrew's, Congresbury, or, as it is pronounced locally, Coomsbury. The village is said to have taken its name from Saint Congar, a son of one of the Easterm emperors, who is stated to have decamped from the Imperial Court in order to escape a matrimonial connection enforced by parental authority. After travelling in Italy and France he settled here in King Ina's time, and, surrounded by marshes and thick woods, became a hermit and built an oratory to the Holy Trinity. The church possesses a Norman font, but the earliest portions of the building now remaining are of Late Thirteenth Century date, and comprise the nave piers and arches, the north and south doorways, and a double piscina in the south wall of the chancel. The oak rood screen is of a somewhat unusual design, and the carving is delicate and refined, though boldly projecting. The large east window of five lights has lately been filled with stained glass by the vicar, the Rev. Maunsel Eyre, and adds greatly to the beauty of the church. Besides the details given on the drawing there are several others of interest, notably the piscina.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 342.)

FOUR CHAIRS OF THE SEVENTEENTH CENTURY.

Amongst our illustrations this week will be found a sheet bearing the above title, on which are delineated four chairs of a very interesting and suggestive character. The Oak Armchair to the left, at the top of the page, is dignified and well-proportioned, and the carving is rich and good. Modern examples based on such a type should insure them a ready admission into a gentleman's mansion. A piece of furniture of this class, if well made, would always be worth having, and an object for the owner to point to with pride. The turning of the legs is very effective, and the strengthening bars are as elegant as they are efficient. The High-back Chair adjoining the latter, if more usual, is equally good, and is thoroughly quaint, and the scroll carving in the back and the turned work merit attention. The Child's Chair is surely not bettered by the fragile and easily-tilted modern invention. The weight of the stout oak in this specimen and the spreading legs, both elements of stability, show, like most old work, that the object for which a particular piece of furniture was designed was never lost sight of in the desire to bring forth something novel. The diminishing back, therefore, though adding much to its picturesque appearance, is the result not so much of any whim or striving for effect as the natural outgrowing of the primary need, the sloping legs below the seat becoming the sloping framing of the back above the seat. The carving is crude, but possesses, at any rate, spirit, and looks as if wrought by a hand with a mind behind it, and not as though produced by the precise monotony of a machine. The last chair on the page belongs to that sturdy class which, owing to strength and vigour of construction and outline, makes it a desideratum where it would be exposed to rough usage, and a couple of such chairs, with a table of similar character, would give a substantial appearance to an entrance hall at little cost. The originals are in the Science and Art Department, National Collection.

COMPETITIONS.

Camberwell. — A limited competition is in progress for the new public baths to cost £24,000 at Camberwell, and among the architects invited to compete, we understand, are the following:—Messrs. Spalding and Cross, Mr. R. Wellock, Mr. Charles Bell, Mr. Lewis Isaacs, M.P., and Mr. Thomas Verity.

London.—Tottenham Court-road is to have another addition to its large buildings, as the Whitefield Tabernacle is to be rebuilt on a vastly larger scale than the old structure. Several architects have been asked to send in designs, and the drawings will shortly be on view. It is said that a well-known Church architect will act as assessor for the promoters.

CHIPS.

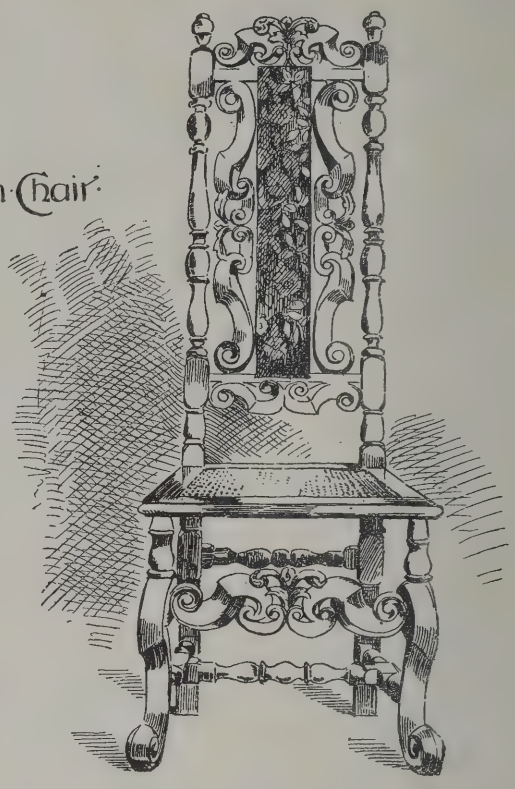
A block of Corporation stables were opened by the Mayor of Accrington on the 22nd ult. They adjoin the new abattoirs in course of erection, and cover an area of 2,000 square yards. The fronts are of stone, backed with brickwork, and finished internally with white and glazed bricks, the internal woodwork being all of pitch pine. Messrs. Moore Brothers, of Rawtenstall, are the contractors for the buildings, which have been carried out at a cost of £4,700, from plans by Mr. William J. Newton, the borough engineer.

The Happy Valley at Llandudno, a portion of the slope of the Great Orme's Head, was formally presented to the town by Lord Mostyn on Friday. The grounds have been laid out by Mr. T. T. Marks, surveyor to the Llandudno Improvement Commissioners, and a feature is a fountain, executed by Mr. Maddocks, of Shrewsbury, from designs by Mr. A. B. Deakin, of that town, selected in competition. The fountain is Classic in character, and is of red Mansfield stone, Italian dove marble being used for panels and basins. Under the canopy is a bronze bust of her Majesty, executed by Messrs. Bellman and Ivy, of London.

The parish church of Mithian, Cornwall, built in 1861, has been receiled, the windows being renewed, and the internal walls replastered. Mr. J. Piers St. Aubyn was the architect for the restoration.

A county club for Glamorganshire is about to be built from plans by Mr. E. W. M. Corbett, of Cardiff, on a site in the Cardiff Arms Park, given by the Marquis of Bute. It will be three stories in height and faced with local stone and terracotta. The chief apartments are the dining-room, 45ft. by 23ft., committee-room, 20ft. by 13ft., and reading-rooms, each 27ft. by 21ft.

The renovation of the Vandyke Room, containing the portraits of King Charles I. and his family, and the ante-Throne Room at Windsor Castle has been completed, and workmen are now employed in redecorating the interior of the Queen's private chapel and the South Corridor.



A stained-glass window, from the studio of Mr. Taylor, of Berners-street, has been erected in the Presbyterian Church, Gravesend. The subject is "The Good Shepherd."

WAYSIDE NOTES.

SIR THOMAS N. DEANE will receive the congratulations of the architectural profession for the honours conferred upon him at the opening of the Irish National Museum, his admirable Dublin work. A well-merited honour, as all will admit, and considering the sparseness that characterises the conferring of knighthood upon architects, an enviable one. It is, moreover, not often that the designer of a building, great or small, public or private, comes in for such appreciative notice as did Sir Thomas on Friday last, when Lord Zetland dwelt upon the merits of the building, built of Irish marble and stone by Irish workmen—a fact that seems to give no little satisfaction to Ireland, "including England, Scotland, and Wales." Home Rulers and Unionist have for once a subject for the exchange of mutual congratulations.

And it is, undoubtedly, a satisfactory aspect of the affair that the buildings are thus associated almost solely with local industry and talent. It is always a pleasing thing to lean that local industries and local men have been engaged on works, the principle exemplified being sound, and at the bottom of much human progress. The benefits of co-operation and concentration of energy are thereby obtained, whatever the doubtful science of "political economy" may have to say about the matter. Of course in these considerations I bar cases where competitions are "won" by local influence. Putting exceptions of this nature aside, there is every reason to be glad when we see work in town or country executed by men living and labouring therein. Every time work is given to outsiders and strangers, be they architects, contractors, or labourers, something is done towards pauperising and weakening the town thus acting, a fact I pointed out in regard to the working of stones in quarries far away from the buildings in whose walls they are destined to be incorporated, and a fact that I am never tired of pointing out as opportunity arises. To find that this waste of energy and money has been so studiously avoided in the capital city of Ireland—the Ireland of which we hear so much as to its poverty and lack of occupations for its people, and as to its decaying industries and general stagnation of business—is especially pleasing.

Reading the letter of your correspondent, the Vicar of Dagenham, *re* the scarcity of cottage accommodation in his district, I held it to be a moral certainty that the evening of the day of issue of the "B.N." containing his letter, would find a horde of the Buggins fraternity encamped on every available square yard of building land at Dagenham. I pictured to myself a veritable *blight* of jerry-builders, the air thickened with them, and the Essex highways and byways crowded with lumbering waggons bearing whole shiploads of R.C.I.J.'s—by which, I may explain, I mean rolled cinder-iron joists—of "shaky" fir joists and rafters, and unseasoned, ready-made sashes and doors, and ingredients, chiefly *road-scrapings*, for the preparation of that evil-looking mixture which by courtesy, and out of deference to district surveyors and surveyors to urban and rural sanitary authorities, Mr. B. calls "mortar." Building somewhat hastily on these premises—only, it seems, to be too quickly proved mere vain imaginings—I had hoped that some abatement in the shoddy-building fever might become instantly observable in the much-ravaged suburban districts of London. Vain hope, indeed; for Mr. Crosse's communication was a veritable wet-blanket. With its appearance the spirits of Buggins and Co. must have gone down to zero. The thought of the "several years" during which the ground of your correspondent, his client, has remained innocent of buildings, cottage or otherwise, must have acted like a freezing mixture.

For the encouragement of honest speculative builders, I must add, however, that it is my conviction that the S.E. district of Essex is not a bad place in which to look for a "spec." The Great Eastern Railway have recently pushed forward the construction of new branch lines of rail, opening up villages as centres of possible—nay, *certain*—residential districts. Houses of a small class, and cottages, are mostly required in these parts, and although my small knowledge of the village of Dagenham—confined to a rapid passing through on the occasion of a small archæological tour of inspection in that district some years back—does not enable me to reconcile the two letters you have received on this subject, I can yet believe that the Vicar of Dagenham is not abroad in his statement as to an existing want in his district.

If I were of the speculative building persuasion, I should make it my business to keep my weather-eye on the extension of railways round London, moving my base of operations to such places as were situate on advanced lines of rail. I would, indeed, had I to produce bread and cheese in the speculative building line of business, look ahead considerably, and get abreast of proposed new railways. But ninety-nine men out of one hundred are timid to essay or adventure. I have particularly noticed this with regard to building. It may be that some persons like to tack on to other people's work, feeling then more secure when the the winter winds howl about the 9in. walls that bear up the roofs so innocent of superfluous timbering and so utterly void of constructive principle. It may be that when Mr. B. is about to pay cash for a new plot of land (99 per cent. of the purchase-money remaining payable by instalments over a period of years), he looks more favourably upon that with a ready-made party-wall, even if he has to pay "through the nose" for it. Anyhow, readiness to discern the probable tide of events and their influence on values, and the balance of supply and demand, is not a prominent mental gift among the fraternity, or they would be building more in divers places around the Metropolis. For there are districts other than the S.E. of Essex that offer good chances; but having given one tip, I feel that I have been abundantly liberal in a matter where silence is golden—at least in the eyes of architect and artist and every well-ordered specimen of the genus *Homo*.

Emerson, in a beautiful passage, has spoken of the irrepressible force of Nature in covering with plant life the most hard, barren, and unsightly of artificial constructions, as where, in the paved street, the grasses penetrate through the crevices between the stones. It must appear a singular sight, illustrative of this unrestrainable plant life, to witness the ferns which, according to the *City Press*, have crowned a mass of debris on the floor of the ruined church of St. Mary Magdalen, Knightrider-street. Some three years ago the church was burned down, and since the fire the building has been left in a state of ruin and decay. Now, among the charred timbers and the barrenness of desolation, have arisen a luxuriant mass of ferns, which doubtless look all the more beautiful by contrast to their blackened, unlovely surroundings.

Considering the amount of writing got through in these days, one can but notice the fact that if good comes of the arguments put forward, the complaints made, and the shortcomings pointed out, it must be in a very gradual and unappreciable manner. It is something quite unusual for a newspaper correspondence to result in actual visible reform. But we have an instance. The sea-serpent season has been enlivened, or otherwise, by a discussion on sky-signs, and one of the most obtrusive of these is about to be removed from the Metropolitan horizon. In deference to expressions made in the public press, Messrs. Hudson Bros. have decided to remove the framework and letters set above their fine new premises in Ludgate Hill. This is very considerate of Messrs. Hudson, for I don't suppose they could have been compelled to remove the objectionable swinging signs. It would be as well if other parties could be induced to follow their example, and thus rid the London sky-lines of a very undesirable innovation.

The *A.A. Notes* for September are, as usual, full of good matter. The continued article on Sir William Chambers's letters will be read with interest, and students who have not read Street's R.A. lectures will find food for reflection in the matter to be printed in future numbers, as well as that in the present one, anent "The Study and Practice of the Art of Architecture." In the "Notes" within the *Notes*, reference is made to the future of district surveyors under the new conditions to come into force, and the change is very properly deplored. The question whether the church is best lighted by farthing dips or the electric light still forms subject of discussion and controversy. The management require suggestions as to next year's annual excursion, which is taking things commendably in good time. The neighbourhood of Shrewsbury is hinted at. Preceding the whole of the matter in the journal is an article on "The Past Session," genial and thoughtful in its nature, and alluding to the proposed changes in the Association. I fancy that the council of the A.A. will have less difficulty in making progress with the Educational Scheme in the next session. Whether they will be able to carry it through in exactly the original form is very doubtful; but the opposition caused by the attempt to deal with a large question in a hurry, and settle matters right off at the fag end of the session will be conspicuous by its absence in the coming session. Some, there may be, opposed tooth-and-nail to any change whatever; but persons looking beyond their own ends and interests, and having rather the welfare of the Association, as a whole, at heart, will now be at hand to help the cause of the reform.

Says the editorial article in *A.A. Notes*:—"The delay to some may appear vexatious; but good measures, like good wines, improve by keeping, and there is no reason to suppose that the result, when revealed during the coming session, will be other than advantageous to the Association, and beneficial to the future career of its members." This is just the spirit in which the matter should be viewed by every member. The delay should be regarded only as another opportunity for considering and perfecting plans for the future. Time will then probably show that it was well that the changes should be made in a deliberate manner, and not in a feverish haste that would surely have had its ill effects had the whole scheme been settled at quite the end of the session.

Members of our profession, when glancing over the dailies, are often amused with the vain struggles of the average reporter to master the technicalties of a new church or town hall he is attempting to describe when chronicling the stone-laying or opening ceremonies. His safest course is to bone or cadge the architect's report; but in his endeavour to reduce the dry terms to a language comprehended, as he imagines, of his readers, he often makes a sad hash of it. Only too frequently the architect is ignored. The "liner" generally credits the builder with the merit of the conception or restoration, and, while carefully giving the names of the clerk of works and foreman, omits all mention of the architect. Then, when the reporter has done his best with the subject, the compositor throws fresh light on the matter by ingenious misprints, and the reader or sub-editor falls into fresh traps in correcting the slips. Neither masters the elementary fact that the names of styles are "proper," and therefore deserve the distinction of capital letters. Even the *Standard*, a journal whose staff certainly ought to know better, in a big-gooseberry article of Wednesday's issue on the ignorance of archæologising tourists, asserts that the exploration of a district in the country offers "splendid opportunities for the display of one's erudition or one's ignorance, for discoursing on Norman arches, early English chantries, or perpendicular windows," the writer failing to see that he has availed himself of just such a splendid opportunity for the display of his own erudition, or ignorance.

GOTH.

The Mayor of Wycombe, Mr. Thomas Glenister, the first chair manufacturer who has occupied that position in the borough, last week invited all the employés, both male and female, connected with the chair trade to visit Wombwell's Menagerie, then exhibiting in the town. About 2,500 of them were admitted to the show at the expense of Mr. Glenister.

The restoration of Linkinhorn church is making progress under the direction of Messrs. Hine and Odgers, of Plymouth, the architects, and the work will be completed in October. In peeling off the lime wash from the south wall, portions of texts, in old black letters, surrounded by scrolls, were noticed, and below these again indications of coloured figures, and on a complete removal of these outer surfaces a life-size figure of our Lord was disclosed, with groups of smaller figures at each side and beneath His feet, representing the seven acts of mercy. The legends are all in English. The dispenser of mercy in every act (excepting the last, in which a priest with a tonsure appears) is a woman in the dress of an abbess. The date appears to be about 1380.

CONTEMPORARY BRITISH ARCHITECTS.*

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THIS plate is the twentieth sheet of portraits of living British Architects. The first photograph is that of Mr. George Frederick Satchell, who was articled to the late Mr. William Wallen; subsequently he was two years with Messrs. W. G. and E. Habershon, and spent ten years in the architectural department of the late Sir Samuel Morton Peto's office. For the past twenty-one years he has been in practice with his present partner, Mr. R. Clarke Edwards, F.R.I.B.A., and in company with him, has carried out, amongst others, the following works: Churches at Green-lanes, Stoke Newington; Highgate-road; Mission church at Crowborough; Restoration of St. Andrew's, Barningham; All Saints, Hopton; St. Margaret's, Wattisfield; St. Matthew's, Leavenheath; St. John's, Isle of Dogs; Hirbury: Notting-hill; Gospel Oak; and Westminster Chapel. School-houses at Crowborough-cross; Gospel Oak; and Hendon. Houses at Barningham; Brondesbury; Carshalton; Crowborough; Edmonton; Hampton Wick; Hampstead; Henley-on-Thames; Kingston; Mill-hill; Richmond; Staines; also the new publishing and printing offices for the proprietors of *The Field*, *The Queen*, and *The Law Times* in Bream's Buildings, Chancery-lane, an illustration of which appeared in our issue of the August 8th last. Mr. Satchell's photograph was taken by Mr. R. H. Macey, of Rosslyn-hill, Hampstead.

The second portrait on the plate is that of Mr. Charles Henry Howell, F.R.I.B.A., the architect to the Lunacy Commissioners. Mr. Howell was elected an Associate of the Institute in 1848, and became a Fellow in 1861. His practice has been a very extensive one, and he has built several mansions, some of which we have illustrated. His principal works, however, have been large asylums, and such-like buildings; for example, within the past few weeks Mr. Howell has been appointed architect for the Surrey County Buildings, to be erected at Kingston—a work of great magnitude. He has been Surveyor of Public Works for the County of Surrey for many years, and also Surveyor to the Norwich Union Insurance Company. His portrait is by Mr. William Goodfellow, of Regent-street, W.

Mr. Peter Paul Pugin was born at the Grange, Ramsgate, on the 29th June, 1851, the Feast of SS. Peter and Paul, and a year before the death of his father, Augustus Welby Pugin. He was brought up in his brother's office, and had many opportunities of gaining practical knowledge on works in execution. On the death of his elder brother, Edward Welby Pugin, he went into partnership with his brother, Cuthbert Welby Pugin, and continued the practice under the name of Pugin and Pugin. In 1889 he had the honour of being made a Knight of the order of St. Sylvester, by his Holiness Leo XIII. Mr. Pugin's photograph is from Mr. Barraud's studio in Oxford-street, W. The following are a list of the more important works carried out by Pugin and Pugin:—Churches: St. Francis, Glasgow; Walton-de-Dale; Uttoxeter; Aber; St. Helen's, Kilburn; Atherstone; Dumfries; Roselands, Walmer; St. Margaret's, Glasgow; Carfin; Smythum, Lanark; St. Mary's, Liverpool; Swansea; Over Darwen; Mossend; Rotherwas; Bootle; St. David's, Cardiff; Fochabers; Edge Hill, Liverpool; Scarisbrick; English Martyrs, Preston; Linlithgow; Rutherglen; Leominster; St. Sylvester, Liverpool; Memorial Church to the late Duchess of Norfolk, St. Anne's-on-Sea; Franciscan Church, Upton, Forest Gate; Ford; Fort Augustus; Crewe; Paisley. Colleges and schools: St. Francis, Glasgow; Parliament Fields, Liverpool; Crosshill, Glasgow; Smyllum, Lanark; St. John's, Glasgow; Port Tennant, Swansea; Carstairs; Edge Hill, Liverpool; Clydebank; St. Peter's College, Glasgow; Dundee. Convents and monasteries: Fort Augustus; Belmont; Roselands, Walmer; Dumfries; Mayfield, Sussex; Ramsgate; Franciscan Monastery, Upton; Bartistree; Paisley; Stanbrook; Presbyteries: Walton-le-Dale, Tower Hill, Rockferry, Ormskirk, Kemsing Park, Mayfield, Cleland, St. Mary's, Liverpool; St. John's, Glasgow; Merthyr, Cardiff, Linlithgow, Rutherglen, Longton, Sheerness. Altars: Warrington, Walton-le-Dale, Belmont, Atherstone, Rockferry, Ormskirk, Longton, Roselands, Cleator, St. Margaret's, Glasgow; Mayfield, Sussex; Copperas Hill, Liverpool; Swansea, Ramsgate, St. Leonard's, Mossend, Hastings, Cardiff, Fochabers; Upton, Forest Gate; Edge Hill, Liverpool; Scarisbrick; Tamworth; Mark Cross, Sussex; Stafford Wolseley Hall; English Martyrs, Preston; St. Wilfrid's, Preston; Bolton, Rutherglen, Leominster, Paisley, Bournemouth, St. Alban's, Liverpool; Mount Carmel, Liverpool; Ushaw; Sacred Heart, Glasgow; Port Glasgow, Saltcoats, Springburn; Maryhill, Glasgow; Greenock, Broxburn, East Cambridge, U.S.A., Workington, West Gorton; Holy Cross, Liverpool. Alterations and additions: Sunbury, Johnston, Adelaide Cathedral, Gloucester Gate, Salford Cathedral; Hasilour Hall, Tamworth; Greenwich, Stafford, Lytham; Good Shepherd Convent, Hammersmith; St. Mary's, Horseferry-road; Brindle; St. Andrew's Cathedral, Glasgow; Margate, Blackwood, Anderton, Maryhill, Westby; Exhibition Hall, St. Cuthbert's College, Ushaw; Scarisbrick Hall; Eskadale, Birkenhead; Exhibition Hall, Oscott College, also Albion Club, Ramsgate; Almshouses, Bullingham; hall, Motherwell; stables, Blackheath; Ullathorne Memorial, &c.

Mr. Edward Robert Robson, F.S.A., architect to H.M. Education Department, was for some years architect to the Corporation of Liverpool, but is better known as the first architect of the London School Board. He was in partnership for a time with Mr. J. J. Stevenson, F.S.A., as mentioned when we gave that architect's portrait (BUILDING NEWS, Feb. 14, 1890). Mr. Robson's articles on "School Planning" appeared in our pages nearly twenty years ago, and subsequently were published in a book form under the title of "School Architecture," and became the standard work on the subject. Mr. Robson has frequently been engaged as professional assessor in architectural competitions, and his school buildings all over London are familiar to our readers. The following are some of the principal buildings erected by him:—The People's Palace for East London; Piccadilly Art Galleries and Prince's Hall; the New Gallery, Regent-street; White Hart Hotel, Windsor; Dunstable Grammar School; Wilson's Grammar School, Camberwell; High School for Girls, Blackheath; Firth College, Sheffield; Central Schools, Sheffield; School Board Offices, Sheffield; schools for the London School Board; St. John's School, Chester; Bow School, Durham; School Board Offices extension, London; house at Carswick Hill, Sheffield; another at Ranmoor, Sheffield; houses on the Bolingbroke Grove estate; Loftus Town-hall; Municipal Buildings, Liverpool; Queen Anne's Mansions extension, Westminster; St. James's Club extension, Piccadilly; Temple Chambers, Temple-avenue; Trosley Towers, Kent, for Sir Sydney Waterlow; house at Haslemere; restoration of Durham Cathedral; Christ Church, Luton; Church of St. Ann's, Liverpool; St. Cuthbert's Church, Durham; St. Mary's Church, Rainton; School Chapel, Blackheath; Luton and Belmont Vicarages. Mr. Robson's photograph is by Mr. Fall, of 10, Baker-street, W.

Mr. Frederic Chancellor, F.R.I.B.A., was born at Chelsea, articled to Mr. A. J. Hiscocks, one of the earliest Fellows of the Institute, and subsequently for some time was in the office of Mr. Ewan Christian. He gained the first prize in architecture at the University College, London, in 1844-45, then under Professor Donaldson. In 1848 he joined in partnership with the late Mr. Beadel and his son, Mr. Wm. Jas. Beadel, the present member of Parliament for Mid-Essex, conducting their architectural practice until 1860, when he commenced business on his own account in London. In early life he was much engaged in the erection of farm buildings, and was the first architect to carry out the system of covered yards, some thirty of which he has erected in different parts of the country. In 1851 he gained, in competition, the first place for the proposed new grammar school for the Trustees of Felsted Charity, and has continued to be their architect up to the present time, carrying out all their new school buildings, chapel, infirmary, and the works connected with them. He has also been very largely engaged in building banks. For the London and County Banking Company he has erected about forty new banks in London and the provinces, in addition to carrying out extensive alterations to many others. He has also erected many of the banks for private firms and companies, and four corn exchanges. His ecclesiastical experience has been extensive, having erected or restored fifty churches and numerous parsonage houses and schools. He has also erected and remodelled many private mansions, including Whilton Lodge, for Mr. J. A. Craven; Hanford House, for Mr. E. C. Ker-Seymer; Longmeads, for Mr. R. Woodhouse; Foliejon Park, for Mr. D. Blane; Dorwards, for Mr. H. Dixon, and the late Mr. O. E. Coope; Langtreys, for Mr. J. J. Tufnell; Hatfield Place, for Mr. W. M. Tufnell; and many others. He rebuilt the extensive works for Messrs. Ransome and Co., at Ipswich, and the factory of the Star Brush Company, at Holloway. In the City he has erected the Reliance Office, in King William-street; the Bank of British North America, in Clement's-lane; and numerous other offices and places of business. He has been architect and surveyor to the Coachmakers' Company since 1865, and has, during that period, rebuilt their hall and the whole of the business premises upon their property in the City. He has also been largely engaged in erecting buildings for the working classes both in London and the country—notably five large blocks of industrial buildings in Farringdon-road. In 1871 he was appointed one of the first diocesan surveyors for the see of Rochester, since transferred to that of St. Alban's, an appointment he still holds, having also been appointed diocesan architect upon the death of the late Mr. Joseph Clarke, F.S.A. He has taken an active part for upwards of 30 years in the sanitary arrangements of the town of Chelmsford, where he resides. From 1858 to 1865 he was town surveyor, and upon resigning this office he was elected chairman of the Sanitary Committee, and afterwards chairman of the Local Board, which appointment he held for many years, until it was superseded by the Charter incorporating the town. Upon this taking place he was elected the first mayor. He has also, since 1859, been connected with the volunteer movement, having passed through all the ranks of the service, and retiring in 1889 as Lt.-Col. of the 2nd Essex V.R.B. Mr. Chancellor was one of the founders of the Essex Archæological Society, and has contributed many papers to its meetings. He is now occupied in bringing out a very important work, "The Ancient Sepulchral Monuments of Essex," a work upon which he has been engaged for years, and which will be published this month. The portrait is from a photograph by Bassano, of Bond-street.

Mr. T. Chatfeild Clarke, F.R.I.B.A., and a Vice-President of the Surveyors' Institution, has throughout his career carried on a large general practice, not only as an architect, but as a surveyor, including the giving of evidence in various classes of cases, both relating to compensation and otherwise. He holds the appointment of surveyor to the Fishmongers' and Cordwainers' Companies and other estates. Many years since he took an interest in schemes for the better housing of the working classes, and at Walworth, Hoxton, and elsewhere has carried out blocks of buildings of this character. Among some of his larger works in the City of London, the Royal Bank of Scotland, in Bishopgate-street; the London and Lancashire Insurance Co.'s Offices, 66 and 67 Cornhill, 37, Leadenhall-street, 23, 24, and 25, Billiter-street; the National Branch Bank, Grosvenor-gardens; several sets of offices situated in Fenchurch-street, and large blocks of warehouses in St. Mary Axe, Bury-street, and various parts of the City, may be mentioned. Mr. Clarke has designed and carried out several large schools in London and the neighbourhood, the St. Mary Datchelor Schools at Camberwell; the Parmiter Schools in Approach-road, Victoria Park; the South Hornsey Elementary Schools; and similar schools at Crouch End, Highgate, and Little Titchfield-street; and he is now executing the Bishopsgate Girls' School, situated in Spital-square. In domestic architecture he has carried out large houses at Virginia Water; Hand Cross Park, Sussex; King's Ride, Ascot; Cuthedge, Essex, and many others. He has erected several waterside warehouses—for instance, the West Kent Wharf, Dublin Steam Wharf, Leith and Glasgow Wharf,

* We advise friends of those architects and others whose portraits have appeared to secure any copies they may desire of the issues in which they are published. We have not many left. We remind readers generally that the last half-yearly volume, containing as it does nearly 100 portraits and biographies of the leading architects, sculptors, decorators, builders, and art-workers, is a most valuable and interesting portrait gallery apart from its ordinary utility. It can be had, bound in cloth, price 12s.; but not many copies are bound up, and they should be secured at once.

and he is now erecting, in conjunction with his son, two wharves for the firm of Sir Andrew Lusk and Co. Among churches and chapels that have been erected by him may be mentioned the Devonshire-square Church; Unity Church, Islington; Esssex Church, Kensington; Westbourne Church, Emsworth; St. James's Church, Gunnersbury; and chapels at Eltham, Stratford, Mile End, Bermondsey, and other places. He has erected institutions for the Home for Little Boys at Farningham, the Hertfordshire Convalescent Home at St. Leonard's, and Working Men's Clubs and Missions in London and Birmingham. In recent years, several large blocks of buildings—assisted by his son—have been erected by him on the south side of Oxford-street, on the estate of the Duke of Westminster, and they are now known by the following numbers: 385, 387, 389, 391, 393, 395, 397, 461, 463, 465, 475, 477, 479, 481, 483, 485, and 487. In Bouverie-street, Fleet-street, the *Daily News* Printing, Publishing, and Editorial Offices, covering a large area, is one of his buildings, and Essex Hall, Essex-street, Strand, was converted by him from a chapel into a public hall, with large accommodation for committee rooms, &c. Other buildings erected by him are 25, Throgmorton-street, new buildings now in course of completion for Sir Reginald Hanson; 38, Great Tower-street, &c. Mr. Clarke has found time during a busy professional life, to devote himself to many schemes of social and moral reform, and has been interested, when on the Council of the Royal Institute of British Architects, and as a member of the Council of the Surveyors' Institute, in the advancement of schemes for examination for the promotion of the higher education of the profession; and he has taken an active part in the discussion of all questions relating to land reform, land transfer, leasehold tenure, and otherwise. His portrait is by Mr. Fall, of Baker-street, W.

ST. PAUL'S PREPARATORY SCHOOL, COLET HOUSE, WEST KENSINGTON.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

WHEN the Governors of St. Paul's School determined to erect new buildings in West Kensington, it was thought advisable to open a high-class preparatory school in the immediate neighbourhood where boys could be efficiently prepared for entrance into the new St. Paul's School. Colet House School was opened in January, 1881, with 6 pupils, but the number increased so rapidly that for the last few years at least 300 names have been on the books. As St. Paul's School rapidly filled, it became necessary to find a site on which a new preparatory school could be built to accommodate the increasing number of its pupils. Last year a plot of three acres, with a frontage of about 200ft., on the Hammersmith-road, immediately facing St. Paul's, was secured, and Mr. W. H. Spaull, F.R.I.B.A., of Oswestry, who has had considerable experience in school building, was asked to prepare plans for the proposed erection, and he accordingly designed the building in two blocks—namely, a front building, comprising a dwelling-house and boarding establishment to accommodate sixty boarders, and a distinct school building in the rear to accommodate 400 day scholars. This latter building cannot fail to be of interest to all practical educationalists. It consists of a large central hall, 69ft. long and 38ft. broad, on three sides of which are class-rooms, with a head master's room, assistant master's room, book room, &c. On the first and second floors the class-rooms open into and communicate with the large hall by galleries running round three sides of it. There is a staircase at each end of the gallery, so that the boys can assemble in the central hall in the shortest period of time and with the least possible disorder. It is calculated that in case of alarm from any cause, the whole school of four hundred pupils, if seated at work in the class-rooms, could be transferred to the playground in about half a minute. The school building is without corridors and without passages—in fact, the head master, when seated at his desk on the platform, has a view of every class-room door. The whole of the ground floor is paved with wooden blocks, the central hall floor being laid in oak and jarrah wood. Two terra-cotta fireplaces are an observable feature in the large hall, the interiors of them being lined with Mr. J. C. Edwards's lustre tiles, and fitted with fire-dogs. Hot-water apparatus supplements the heat from these fireplaces. With the exception of this hall, the whole school is heated by open fires, Galton's patent grates being used in the class-rooms. In every class-room there is a separate flue fitted with a Boyle's ventilator to take off the foul air, so that these rooms will be free from the stuffiness usually pervading a schoolroom. Several of the class-rooms have been built in pairs, so that two rooms can readily be converted into one in case of unexpected absence of a master, or when otherwise necessary. This building, which will be opened on September 16, seems to be the nearest approach at present in existence to a perfect school building. In the boarding-house block the only interesting feature is the extra precaution taken to secure the safety of the boarders in case of fire. After consultation with the Fire Brigade authorities, it was determined to construct all the staircases of oak, as being the best fire-resisting material; but to make escape absolutely certain in case of fire, four separate staircases have been constructed in the boarding-house block. The contract for the building has been let to Messrs. Stephens, Bastow, and Co., of Bristol. The style of the front building is Domestic Gothic, with red terracotta dressings and red-brick facings, the former being from the works of J. C. Edwards, Ruabon. It may be an interesting fact to mention that the completeness of Colet House for the working purposes of a school is due to the fact that the architect simply endeavoured to carry out the wishes of a practical teacher. The existence of St. Paul's School and the Preparatory School side by side will be a great boon to the inhabitants of the West-end of London, who prefer day-school life for their sons, as it is now possible for a boy to receive a systematic education from the time he leaves the nursery until he is ready for the university or the army. Recent examinations show that four out of the six Paulines who recently passed for the Indian Civil Service, and twelve out of the twenty successful Pauline candidates in the Army Preliminary Examinations, received their early education in the Preparatory School. Mr. J. Bewsher, M.A., the head master, will be pleased to show the buildings at any time to architects or other gentlemen interested in school buildings.

WHICH *IS* THE LARGEST PARISH CHURCH IN ENGLAND?

IT has been recently claimed that St. Michael's, Coventry, was the largest parish church in England; but Mr. Lupson, the parish clerk of Great Yarmouth, has quickly taken up the cudgels on behalf of St. Nicholas's, Yarmouth. In this week's *Guardian* he says:—

"An attempt has lately been made with much assurance to deprive St. Nicholas's, Great Yarmouth, of its renown; but it will not do, and the statement must be contested that has gone forth from St. Michael's Vicarage, Coventry, and recently copied into various newspapers, to the effect that the glorious church of that parish is, in respect of area, the premier parish church of the land, being 293¾ft. long and 127ft. wide in its broadest part, and that its present area, including the tower, is 24,015 superficial feet, 'thus making it the largest parish church in England; St. Nicholas's, Great Yarmouth, coming next with an area of 23,265 superficial feet.'

"St. Nicholas's, Great Yarmouth, is perfectly contented with and glories in possessing 23,265 superficial feet, and by them still claims to be respected by all men as being truly the largest of the strictly parish churches in England.

"In the work published by the writer eight years ago (now out of print), giving the history of St. Nicholas's Church, the following footnote explanatory of some remarks respecting St. Michael's Church appears, page 13:—

"'In a descriptive guide to St. Michael's it length was stated to be 293¾ft. and its breadth 127ft. As this statement was at variance with Sir E. Beckett's statistics, he was communicated with, and the following is a copy of his reply:—"St. Michael's, Coventry, is 280ft. long inside, including the tower, but that is only open to the church by a small door. Without the tower it is 252, as given in my list formerly published. I took this from a plan lent me by Sir G. Scott, who restored the church."'

"The list referred to in this note gives the area of many cathedrals and large churches, and states that the area of St. Michael's (without the tower) is 22,080sq.ft. The tower has recently been opened to the church by the formation of an arch, so that its area may now very properly be included in statistics given of the building. Making Sir E. Beckett's statement the basis of our calculation, the tower appears to contain about 784 superficial feet; these, if correct, being added to the 22,080, bring the total area not to the 24,015sq.ft. that are now claimed, but only to 22,864. St. Michael's tower is certainly a magnificent one; but it is not strong enough to bear the weight of its own bells, nor is it large enough to bid St. Nicholas's, Great Yarmouth, to 'come next.'

"Please permit me to mention that at the present time two portions of St. Nicholas's Church are in the hands of workmen, who are engaged in restoration work that will entail an expenditure of about £3,000. Here there is an excellent opportunity afforded the 'faithful in the land' to offer willing aid in rescuing from time's destructive hand the largest of the 'grey old churches' we have inherited from our forefathers."

SOCIETY OF ESTATE CLERKS OF WORKS.

THE above society, which has now been established two years, held its first meeting out of London at the Globe Hotel, Plymouth, on August 26th, when the report stated that the assets of the society were considerably over the liabilities, and that the number of members was now 68, and of honorary members 92, a total of 160. On the following day an excursion was made to Membland, the seat of Lord Revelstoke, his lordship providing a steamer to convey the visitors to and from Plymouth, conveyances to take them the nine miles of magnificent private drives along the cliffs, and on their return a luncheon of a *recherché* character, Mr. Adams, the agent of the estate, presiding. Mr. Adams, in a few brief remarks, stated that in his opinion moral support should be given the society by agents and others interested in landed estates joining as honorary members, as himself and Lord Revelstoke had done. Mr. Chapple, of Plymouth, eulogised the way in which Lord Revelstoke supported local interests, promoted the welfare of the neighbourhood, and lent a helping hand where help was needed. Mr. Crosbie, the clerk of works on the Membland estate, and Mr. Lavers, holding a similar position on an adjoining estate, conducted the party. On the following day a visit was made to Mount Edgcumbe, Mr. Perkins, Earl Mount-Edgcumbe's clerk of works, accompanying the visitors in a drive round the island, from many points of which some splendid views are to be obtained. Afterwards the more interesting portions of the ancient mansion were visited and described. The first provincial meeting of the society was a decided success, members coming to join therein from so far distant as Yorkshire, Cheshire, and several of the Midland Counties.

CRIB FOUNDATIONS.

FOR the foundation of bridges and other structures under water, a timber crib is often sunk by excavating the material through openings, and thus causing the crib to sink. One of the most important instances of a crib foundation is that of the Poughkeepsie Bridge over the Hudson. The four river piers rest on cribs, the largest of which is 100ft. long by 60ft. wide at the bottom, and 40ft. at the top, and 104ft. in height. Baker, in his recent work on Masonry, describes the construction. It is divided by one longitudinal and six transverse walls into fourteen compartments, through which the dredge worked. The side and division-walls terminate at the bottom by a 12in. by 12in. oak stick, which served as a cutting edge. The exterior and longitudinal walls are solid, of triangular cross-section for 20ft. above the cutting edge, above which they were hollow. The gravel used to sink the crib was deposited in these hollow walls. The walls were tied to each other by the end and cross division walls, and each course of timber was fastened to the one below by inch-size bolts 30in. long. The timber is hemlock, 12in. square. The fourteen compartments in which the clam-shell dredges worked were 10 by 12ft. in the clear. The cribs were kept level while sinking by excavating from first one and then the other of the compartments. Gravel was added to the pockets as the crib sank. When the hard bottom was reached, the dredging pockets

were filled with concrete deposited under water from boxes holding a cubic yard each, and opened at the bottom by a latch and hip line. After the crib was in position the masonry was commenced in a floating caisson, which rested on the top of crib. Sometimes iron cylinders are sunk by dredging the material from the inside by an "excavator." The clam-shell dredge consists of two halves of a hemispherical shell which rotate; the shell descends by its weight into the soil, and in raising it the pull of the chain closes the two jaws and forms a bucket inclosing the material to be removed.

BOOKS RECEIVED.

Structural Mechanics, by R. M. PARKINSON, Assoc.M.I.C.E., is a small, well printed, and useful treatise on the mechanics of structures. Mr. Parkinson has been to a certain extent successful in supplying the requirements of the student, leading him from elementary to complicated problems. The order of the chapters follows a natural sequence. Thus, the first chapter furnishes the student with data, such as weights of materials, effect of heat, resistance to tension and compression, loads on roofs, floors, and bridges; the next enters into the subject of simple strains in girders and framed structures, these being exemplified by graphical methods, moments, and the method of sections. Practical examples follow with answers for the use of students. The other chapters treat of more complex forces, such as strain out of centre, tubes, torsion, deflection, symmetrical and unsymmetrical beams of iron, steel, and wood, moment of inertia, the principles of arches, and short and long columns, each having examples appended. One advantage of the treatment to the student who desires to learn the subject in a practical manner, is the short and concise statement of general principles or propositions which are then explained or worked out by means of simple equations, trigonometry, and mechanics. For example, the author very shortly and clearly explains the simple strains in a girder. The usual method of taking moments about the ends of beam to show that the sum of the reactions is equal to the weight, and the moment of resistance of the section of beam are simply explained, so that the relation of leverage to resistance is apprehended without having to follow several pages of algebraic formulæ. Complex sections of girder are left for an after chapter, so that the student may acquire the elementary principles as he proceeds. The moment of resistance is next considered in relation to the position of the load. The effect of a distributed load is shown to be that half the weight acts at $\frac{l}{4}$ from each abutment, or $\frac{W}{2} \times \frac{l}{4} = s\text{M}$. The amount of moments can be shown by a diagram, and these diagrams are illustrated for different kinds of loading. The three methods of estimating strains—1st, by the graphic method; 2nd, by moments; and 3rd, by the method of sections—are explained in detail as applied to a roof truss, so that the student may thoroughly make himself master of each of these methods. We have no space to go further. Mr. Parkinson follows the same rule in the more advanced sections of his work. The diagrams are well selected, but the letters to them are rather too small to be read. This is certainly a pity. We can recommend the treatise as one of the best of its class.

The largest block of stone yet quarried is claimed to have been produced at Vinalhaven, Maine. It has been cut out by the Bodwell Granite Company, and is a shaft 115ft. long and 10ft. square at the base, and is estimated to weigh 850 tons. The company suggest that it would form an appropriate State monument to General Grant; but as yet the Maine Memorial Committee do not see matters in that light.

On Thursday, the 29th ult., at the town hall, Hastings, Mr. J. T. Harrison, an Inspector of the Local Government Board, held an inquiry into an application of the Town Council to borrow the sum of £2,252 for the lining and covering of the Halton reservoirs, £1,059 for the construction of a stone groyne at Eversfield-place, and £200 for works of sewerage in Silchester-road. The borough surveyor (Mr. P. Palmer) explained to the inspector the plans, and there was no opposition.

Building Intelligence.

ARMLEY, LEEDS.—Foundation stones of a new Baptist chapel were laid at Carr Crofts, Armley, on Saturday. It is being built in front of the former chapel, henceforth to be used as schools, from plans by Mr. Walter Henstock, of Batley, at a cost of £2,000. The chapel will be 60ft. by 40ft., and will have galleries. The seating on the ground floor will be semicircular. An aisle, 3ft. wide, will run on either side of the chapel. Immediately in front of the rostrum will be the Communion-table with baptistery sunk in the floor. By a special contrivance entrance will be effected to the baptistery from the two robing-rooms behind the rostrum, by going under the rostrum and direct into the baptistery. The organ chamber, which will be on the gallery floor level, will form a recess behind the rostrum, and will be 17ft. 6in. by 11ft. 4in. The walls will be constructed of Leeds red bricks, with ashlar dressings from the Gipton Wood Quarries. The style adopted is Classic, fully treated, and a small tower is provided in front. The whole of the internal woodwork will be of pitch pine varnished. The chapel will seat in all about 600 people. The chief contractors are as follows:—Mr. W. W. Haley, Bramley, bricklayer and mason's work; Messrs. Horshell and Heald, Ossett, carpenter and joiner's work.

BIRMINGHAM.—The shell of the new Post-office is now completed, and, with one exception, the whole is now roofed in. The hoarding will soon be taken down, and the building will be opened in January next. We illustrated the Post-office in our issues of June 8, Aug. 31, and Sept. 21, 1888. Mr. Henry Tanner is the architect, and Mr. Vickers, of Nottingham, the builder. His contract was upwards of £50,000, but the total cost of the buildings and fittings, exclusive of the land, will be between £65,000 and £70,000. The structure will accommodate a staff of about 900 persons, the postal, money-order, and telegraphs being all brought under the same roof. The two first-named departments will be in the front of the building towards New-street. The front hall will be about 80ft. by 60ft., and 21ft. from floor to ceiling; and the public will have the centre of the floor at their disposal, counters being arranged on all four sides. A statue of Sir Rowland Hill will be placed in the middle of the floor. On the floor above, the postmaster's office and offices for the chief clerk, the accountant clerk and his staff, will be situated. On a wing running along Hill-street the rooms in the sub-basement will be used for telegraph stores and for the pneumatic tubes. The parcel-post office will be the room above. This, as in all the other rooms in the administrative department, is lined with white glazed bricks. The letter-sorting room extends the whole length of the building, and is 207ft. by 45ft. The telegraph-instrument room, of like dimensions, will be on the top story. The top story on the Pinfold-street wing will be utilised for the storage of batteries, and below there will be offices for receiving night telegrams, a telegraph delivery room (25ft. by 30ft.), rooms for telegraph inspectors, linesmen, mail-cart men, and the telegraph engineer, and mechanics' offices. The building throughout will be lighted with electricity.

DUBLIN.—The new Science and Art Museum and National Library of Ireland, was formally opened on Friday by the Lord Lieutenant of Ireland, who conferred Knighthood on the architect of the buildings, Mr. Thomas Newenham Deane. The buildings cover the site of the Leinster House, and have cost about £120,000. The style is that of Sansovino's Library at Venice, and the departments include an art museum, a library for 800,000 books, school of art and lecture theatre seated for 500 persons. The arrangements of the collections in the museum is partly by subject and partly geographical. There are rooms and galleries devoted to textiles, wood-carving, glass, china, furniture, music, and others devoted to the arts and industries of Greece and Rome, Egypt and Assyria, India and Persia, and to those of the uncivilised nations of the world. Two rooms have been provided for the noble collection of antiquities made by the Royal Irish Academy. The museum also contains collections illustrative of the geology of the country. A large use has been made in the construction of Irish stones and marbles. We gave a portrait and biography of Sir T. N. Deane in our issue of Feb. 23 last, and illustrated the Museum on Oct. 31, Nov. 14 and 28, 1884.

EDINBURGH. — The new Free Church at Parson's Green, Edinburgh, the erection of which is just about to be proceeded with, will occupy the corner of Portobello-road and Willow-brae-road, Piershill. The designs, which have been prepared by Messrs. Sydney Mitchell and Wilson, Young-street, Edinburgh, show a building in the Decorated style, consisting of nave, aisles, transepts, and apse, with a square battlemented tower at the north-east corner, reaching to a height of about 70ft., and a slated spire rising from this tower to a further height of 40ft. The windows are mullioned with tracery. The principal entrance is towards the west, in a deeply-recessed porch, and in the vestibule a niche is provided for a bust of Mr. Smith, the founder. Interiorly the church is about 90ft. long, 40ft. wide, and it will seat about 500 persons. Underneath the church will be a hall measuring about 60ft. by about 20ft., together with session-house, ladies' room, lavatories, and heating chamber. The chamber, which will be constructed of Corncockle stone, will cost about £5,000.

PENZANCE.—The new swimming-baths, which have been in course of erection during the past year by the Penzance Public Baths Company at the western end of the Promenade, were opened a fortnight since by Mr. T. B. Bolitho, M.P. Mr. Oliver Caldwell, of Penzance, was the architect, and the contract was given to Messrs. Freeman, of Penryn. The bath itself is of concrete, and is 75ft. long by 28ft. wide. The wall next the sea is of granite. At the eastern end the depth of water is 7ft. 6in., and at the opposite end 3ft. 6in. It is filled by gravitation, the water flowing in when the tide rises, and being released when the tide is low. There are twenty-two dressing-boxes, and in the winter the water will be brought up to summer temperature by a heating apparatus.

CHIPS.

The Jubilee statue of the Queen, voted by the county of Worcester, and of which a foundation stone was laid by the Duke of Cambridge in August, 1887, will be inaugurated in Worcester in the present autumn. It is of white Carrara marble, and of more than full life-size, standing on the pedestal 23ft. above the ground level. The figure is by Mr. T. Brock, A.R.A., and her Majesty appears crowned and wearing a robe of State, holding in her right hand the sceptre, and in her left supporting the orb.

Several further additions are being made to the Mayor's Chapel, College-green, Bristol, which has just been restored, from plans by Mr. J. L. Pearson, R.A. The new north transept has a window of noble proportions, 22ft. by 14ft., which has been filled with stained glass at the cost of Sir Charles Wathen, the Mayor. It was designed by Mr. Pearson, and is Early Decorated in character; the subjects are incidents in the life of St. Mark, to whom the chapel is dedicated. A window in the north side of nave has been opened out, and is also filled with stained glass, at the expense of Sir Geo. Edwards, the subject being the Ascension. Both windows were executed by Mr. E. Horwood, of the Stained Glass Works, Frome Selwood, from designs by Mr. W. G. Bailey. A new brass lectern has also been given, 15th century in style. It has an octagonal base supported by four large claws, and the pillar is surmounted by a desk with open work. It was made by Messrs. J. W. Singer and Sons, Frome.

A new Liberal Club has been erected in Bermondsey, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by the latest improved form of Messrs. Robert Boyle and Sons' patent self-acting air-pump ventilator.

The unveiling of the monument to Victor Emanuel at Civita Vecchia took place last week. The statue is by Ettore Rudolfi, a pupil of the celebrated sculptor Monteverde. The figure of the king, leaning on his sword, is about 19ft. high. The base is of Baveno granite.

The inventory of the personal estate of the late Mr. Henry Kennedy, stoneware manufacturer, Glasgow, and Gardenside, Uddingston, amounts to £44,641 6s. 8d.

During the midsummer vacation much progress has been made with the internal fittings of the chapel which has been erected near the Queen's Schools at Eton College from Sir A. W. Blomfield's designs. The seats and wainscoting are of carved oak, and in accord with the style of the building, and a gallery is being constructed at the west end.

Engineering Notes.

LIVERPOOL OVERHEAD RAILWAY.—The Liverpool Engineering Society paid a visit on Saturday afternoon to the Overhead Railway now in course of erection along the line of docks. Over forty members were present, among them being Mr. H. H. West, president, and Mr. F. Huddleston, president-elect. The party examined the plant and machinery which have been erected at the north end of the railway for the purpose of heating, bending, and boring the flooring plates, all of which—and there will be thousands—are exactly alike. These plates are supported by the spans of iron that are placed along the outer edge of the erection, and which vary in length from 50ft. to 100ft. To place these great lengths of iron, weighing about 25 tons, in position, a specially patented gantry has been employed by Messrs. Ives and Barker, the contractors for the railway. This contrivance will project, lower, and fit a span in just over a quarter of an hour, and can be moved forward to repeat the operation in about the same time. The riveting of the spans, each one of which is sent along the viaduct ready to be dropped into its proper place, is done by Allen's pneumatic riveter, which inserts rivets at a rate of over 300 per hour. Progress at the rate of two, or even three, spans per day is being made. The permanent way is laid on longitudinal sleepers, as on the Metropolitan Railway. The engineers are Sir Douglas Fox, Mr. J. H. Greathead, and Mr. Francis Fox, resident engineer.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE, AND ART.—A series of seven competitions have been arranged for next session, the prize in each case being of the value of two guineas. The subjects are, an Architectural Sketch and an Architectural Measured Drawing or Drawings. Both open to all apprentice architects in the counties of Forfar, Perth, and Fife; an Etching on Metal of any subject of an Architectural character; a series of not fewer than four photographs of any Architectural or Engineering subjects; a Modelled or Carved Original Design of an Architectural or Decorative subject in any material; and a Sketch in any medium, from an Antique subject in the Dundee Art Museum of Casts. All these four classes are open to any competitor in Forfar, Perth, or Fife. The last class is for an Architectural or Engineering Drawing, open to the three counties already named.

ARCHÆOLOGICAL.

SILCHESTER. — The explorations which are being carried out on the site of the Roman city of Silchester, Hants, under the personal direction of Mr. G. E. Fox, Mr. W. H. St. John Hope, Mr. Mills Stevenson, and Mr. W. K. Forster, of the Society of Antiquaries, are being attended, says a correspondent of the *Times*, with satisfactory results. Until the present work was commenced nothing was known of the great western gate of the city except its site; but the excavations have disclosed remains of this gate, under which passed the traffic along the main road through the Roman city. The roadway at the west gate was spanned by two arches. Among the massive fragments of the masonry uncovered is the impost of the gate, from which two arches sprang, and the mouldings on one side are cut away in order to allow the doors to shut against it. There are two guard-rooms on each side of the gate, those on the south being most perfect. The wall here has a thickness of 12ft., which decreases as it rises from the ground level, and it is backed by a great mound of earth. A paving of flints forms a pathway to the top of the mound. At the west gate a fragment of a fine Corinthian capital has been found, but it has no connection with the structure. Among the objects found on the site is a large strip of iron pierced with nail-holes, which evidently bound the bottom of a door of the gate. A portion of an iron pivot has also been unearthed. A house has been excavated, and traces have been found of another large house. Between the two houses there is a considerable area of open ground. During the excavations a large number of objects of antiquity have been unearthed.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

BUILDER. (We are not republishing them.)

Correspondence.

THE PROPOSED RE-BUILDING OF ST. CUTHBERT'S CHURCH, EDINBURGH.

To the Editor of the BUILDING NEWS.

SIR,—It may be well that the citizens of Edinburgh, and particularly those of the western district, should be appealed to (in the absence of other action) to guard the city's æsthetic reputation in this extraordinary matter, since it is they who are responsible for the good name and fair fame of their corner. It is they, therefore, who should be asked, in no uncertain way, to say whether they will suffer the time-hand of the dial of progress to be retarded or set back for a century by the carrying into effect of this rebuilding scheme.

The promoters have already been appealed to through the valuable medium of your columns to act as any enlightened "lord of the manor" would who is desirous of improving and beautifying his demesne, by choosing the greatest of competing gains for the city. To the citizens themselves three questions need only be put—namely: Would an enlightened landowner remorselessly shut up from his own and the public's starved gaze a beautiful and elevating prospect, when (to put it mildly) it was open to him not to do so? Would he be likely to build (much more rebuild) an ecclesiastical, or any other edifice "in a hole" if he was not compelled to do so? Would he altogether disregard the eloquent protest of environment when resolving upon such a course?

Possibly a superficial view of the immobility of countenance with which the public seems at present to contemplate the matter might lead to the hasty conclusion that the æsthetic horizon of the average citizen was bounded only by personal wants and necessities, suggesting almost the significance of the ancient interrogatory—"Is it nothing to you all ye that pass by?" One secret, however, of this indisposition to meddle with the matter is probably to be found in the answer returned to the writer by a member of the Cockburn Association (though not as such)—viz., "That Dr. MacGregor was resolute, and it would be little use to oppose him in it"—an opinion, flattering, no doubt, to the senior minister of St. Cuthbert's, to regard him as "a lion in the way"; for when contemplating what was practically an interdict of the re-building proceedings by the law court, he could only exclaim with unaffected resignation: "It was not so to be!" Undoubtedly something like a desire to "let brotherly love continue" is at the bottom of this feeling. Nevertheless, it falls to be weighed against a great and serious drawback—the sacrifice of the fairest part of the city to sectarian purblindness and fetishism; for if the æsthetic perception of the public is to be considered circumscribed because of undemonstrativeness on their part in regard to it, it is much more certain that, in a large number of instances, the citizen is merged, or entirely lost, in the sectary, to the city's great loss and detriment.

It has been said that the power which perceives in such matters is that essential faculty of our nature, the sense of the beautiful. This æsthetic perception, however, viewed in relation to the proposal, has several points of interest. It was reported, for example, of an eminent Scottish Ritualist, lately deceased, that he had "little or no sense of beauty, and hardly any appreciation of form, or colour, of architecture, or even of music." Not less suggestive (in one who possesses "the accomplishment of verse") was a certain ex-professor's laudation of the ritualistic practices of St. Cuthbert's, and the spectacle of the worthy professor straining at an unæsthetic (?) gnat in the middle of Princes-street (to him an æsthetic enormity), while evincing a wonderful capacity to swallow this proverbial camel at the western end of it.

But a graver instance still—because of the semi-official position taken—was the omission by the Cockburn Association of any reference to the subject in their report of July last, notwithstanding that a formal appeal was made to them upon it, and duly acknowledged by the secretary. Such an omission, without explanation, must have been regarded by many citizens with concern; while others may have wished for their withdrawal from a position which they appear to occupy before the citizens—in name only.

The local Press can scarcely be expected to settle corner controversies, yet who shall say it has not been a misfortune to the city that Argus, with all his hundred eyes, has been unable to see any æsthetic blunder or perpetration in this proposal? The *Scotsman's* daily vials are poured out regardless of the step. Its rival sees only shocking things in the desecration of the graves, though it went wonderful lengths in receiving to its correspondence columns certain contributions of the writer's on the æsthetics of the subject; yet, when invited to press home this important and vital part of the question, quietly declined. The *Evening Dispatch* showed a glimmering of morning light in March last, when it said: "It may be that the best thing they could do would be to remove to another site."

One other point fails to be noticed—viz.: The singular circumstance that there are those in the community who regard the writer's action in this matter as an uncalled for interference with private interests, &c. To such persons he will, of course, have little to urge that will be acceptable; but there is one distinguished example in our midst, already referred to, whose utterances are usually received with respect by the public, and by virtue of which any appeal made to him may be regarded as made to reason rather than to unreason. This citizen, after observing that "all excellence of every kind is a mean between too little and too much," is responsible for the following sentence (*vide Scotsman* August 13th):—

"Such is the constitution of things, that every good thing in excess becomes an evil, for two obvious reasons: first, because it becomes unmanageable, defying regulation and despising control; and, again, because in a various and complex social union of separate forces, which society means, no one force can put itself forward with exceptional potency without encroaching on the field and disturbing the action of some other equally legitimate force."

It is necessary to inquire of the author if, with all his powers of differentiation, he is able to strike the mean between the position of the promoters of this proposal, on the one hand, in persevering with it, and that of the writer, on the other, in denouncing it. Or if he is not rather compelled to own that he is face to face with two alternate propositions, one of which must be right, and the other, therefore, wrong. In a word, as far as his mean is concerned—

"That the difference is too nice,
Where ends the virtue, and begins the vice."

The word "force," as there used, calls for some definition, in so far as it is applicable to the sphere of human action. To include this rebuilding proposal under it, it follows that anything, however absurd, that is translatable from the abstract into the concrete is entitled to be called such; from the ball-play of the frolicsome child to the spent or bootless efforts of decrepitude. Stepping out of the field of human action into that of Nature, we find "exceptional potency" disturbing the action of "some other equally legitimate force," and the weaker going to the wall. Again passing into the supernal field, the force which "moves mountains" is a reality, and may have to be calculated with. In brief, it is to be feared, there is more in heaven and earth than is dreamt of in this sage's philosophy.

Another class of citizens less easily reasoned with are those who characterise such action as that of "a heaven-born reformer, who, with much fuss and fluster, sets himself and others the task of disarranging and rearranging all about him, and telling everybody else his duty." To such persons the writer can only reply that he is prepared for any responsibility which the position taken imposes, even to the extent of determining, if necessary, on which side the presumption may lie—whether on the part of the promoters in persevering with their proposal, or on his own in denouncing it.

These few additional observations, Mr. Editor, are offered at the present time, through the Rev. Dr. MacGregor having appealed, at Mid Calder, to the laity of the Established Church to come forward, on patriotic grounds, and take the Disestablishment question out of the hands of the clergy, adding that "if they did so they would find for it a very speedy and very satisfactory conclusion"; and also for another reason—viz., that this rebuilding proposal, which apparently is but a simple question of city æsthetics, may be something more—may even be symbolic of that larger controversy. The Rev. Dr. Scott, at same place, raised this two-fold reference in the following sentence: "They could not say," he said, "that the Church was assailed because it was decrepit or useless." Now, the following extract from the London *Daily Chronicle* of May last will show that there are at least two opinions upon that point; and inasmuch as "pictures are in the vision," this rebuilding proposal must be regarded as a substantial witness of the probable truth of the opposite contention to that of Dr. Scott's:—

"We favour Disestablishment in Scotland also, because the intellectual paralysis which is creeping over the Established Church clergy of Scotland suggests that the Scottish Established Church is dying under our eyes slowly, but surely, for lack of ideas. It is, in truth, falling out of the march of mankind, because it lags behind the rest of Protestant Christendom, floundering in a Serbonian bog of fossilised Calvinistic orthodoxy; mumbling a Confession of Faith that is antiquated and outworn, and offering as satisfying instruction to ardent minds the teaching of a school of Biblical criticism and theology that is almost prehistoric. Except in its pastoral relations, the Established Church of Scotland has ceased to be in touch with the life of the new generation, and it is not worth endowing as an agency of national culture and enlightenment." AUDI ALTERAM PARTEM.

THE BEST BRICK AND TILE KILN.

SIR,—Adverting to your issue of the 13th June, 1890, in which "The Best Brick and Tile Kiln" is described, I request that you will kindly induce the writer of the article to furnish the following particulars:—

1. How do the branch flues J J connect the several chambers with the main flue H? The sketch drawing is not clear on this point.

2. In the fifth par. it is stated, "To avoid the necessity of rounding the corners of the kiln, I place the passages S S S in the end of the division chamber, No. 6, and the passages S' S' S' in the corresponding wall of division or chamber 12." An elevation of one of these walls, showing the openings and a section through one of the passages, is required.

3. Also a longitudinal section of the kiln, showing the openings W W W, and the dimensions of the kiln, or the scale to which it is drawn.—I am, &c.,

HENRY IRWIN, C.I.E.,
Consulting Architect, Govt. of Madras.

COTTAGE PLANS HALF-SOVEREIGN EACH.

SIR,—I send you herewith a specimen of the sort of thing we have to put up with in this neighbourhood, cut from the *Hucknall Star*.—I am, &c., M. S. A.

Nottingham, Aug. 30.

COTTAGE.—Plans prepared to pass the Local Board at 10s. per House. ———, Architect, High Pavement, Sutton-in-Ashfield.

CHIPS.

Mrs. E. M. Barry, the widow of the late Professor Barry, R.A., died on Friday, aged 55 years.

A new *crèche* in Accommodation-road, East Leeds, was opened by the Duke of Newcastle on Saturday. The building is of red brick, from designs by Messrs. Kelly and Birchall, of Leeds, and has cost £2,500.

At the town hall, Eastbourne, on Friday, Mr. J. T. Harrison, C.E., Local Government Inspector, held an official inquiry in regard to the two loans, one for £3,300 for a new refuse destructor, and one for £500 for a scavenger and plant. Mr. Charles Tomes, borough surveyor, explained the proposals.

Langley New Church, which has been erected at a cost of £5,000, is approaching completion, and the Bishop of Worcester has fixed Thursday, October 30, as the day for the opening and consecration of the edifice. The church is to be dedicated to St. Michael and All Angels.

The memorial stones of a new Free Methodist chapel at Dosthill, near Tamworth, were laid on Friday. The chapel, which is being built by Messrs. Watton and Sons, of Tamworth, will accommodate about 120 persons.

A park has been presented to Jedburgh by Mr. John Tinline, who has returned to the borough from New Zealand. It is known as Allerby Well Park, and is 12½ acres in extent.

Some months back Sir Edward Watkin arranged to connect the port of Connah's Quay with his new Hawarden railway at the Dee Bridge, but from some cause the work was suspended. Operations have again commenced, and Mr. Johnson, the contractor, has put a great number of men on the work. The line will be a little over a mile in length.

A new Wesleyan Chapel was opened last week at Heworth, near York. It has been built from designs by Mr. E. Taylor, of Stonegate, York, and is Perpendicular in style. The chapel is of brick; the front of Scarborough yellow brick, with stone dressings. The chapel proper measures 44ft. by 24ft., whilst the schoolroom, on the right, is 22ft. by 15ft., and is separated from the chapel by a partition. Mr. T. Rawling was the builder, and the cost was £1,800.

The Methodist Free Church in Duke-street, Southport, has just been internally decorated at an expense of about £250, a new organ by Foster and Andrews, Hull, being erected, costing £700.

Mr. John O. Scott, F.S.A., is erecting a large porch and cloister to St. Mary Abbot's Church, Kensington, leading from the south-west doorway to the High-street. The building is being done by Mr. Thompson, of Peterborough. It is in stone, and harmonises with the church, which, for its tower and spire, ranks as one of Sir Gilbert Scott's best works.

The Midland Railway Company opened on Monday their Doe Lea extension line in Derbyshire. It is eight miles in length, and connects the Clowne and Teversal branches, thus forming another route from Chesterfield to Mansfield.

The Duke of Edinburgh will unveil the monument which has been erected by national subscription on Plymouth Hoe as a memorial of British worthies who took part in England's defence against the Spanish Armada. The monument, which has been erected from designs by Mr. Herbert A. K. Gribble, of London and Plymouth, and was illustrated in our issue of May 4, 1888, is now so nearly completed that the ceremony will take place during October.

Mr. T. E. Collcutt is the architect of the new branch building for the City Bank about to be erected on an important site on Ludgate Hill.

Intercommunication.

QUESTIONS.

[10362.] — **Fire-proof Floor.** — I am somewhat puzzled to know what is really a fire-proof floor. For a long time it has been stated that concrete is the best fire-resisting material, but now several patentees have adopted interlocking bricks, or terracotta, as the most suitable materials, merely employing concrete as a backing or core, presumably to strengthen or assist the former. I have seen a treatise or pamphlet written by Mr. Hyatt, in which he describes experiments made with concrete, which appear to settle the question entirely, to the effect that it will withstand almost any amount of heat. I also read that a fire-proof floor should be a solid mass, either of concrete or brick; but I noticed in the BUILDING NEWS a week or two since an advertisement of a new system of flooring which sets forth a claim for superiority because the floor is divided into sections with an air space between—which is right? And would concrete in floors expand, or contract, under excessive heat, or would they buckle or twist? And another point is, what about is the cost of concrete fire-proof floors compared with wood floors? Generally, what are the principles which should govern the construction of fire-proof floors, and what form of construction is the most economical in cost, efficiency considered?—F. T. S.

[10363.] — **Testing Lightning Conductors.** — I want to test with a galvanometer a lightning-conductor upon a country house; but as there are no gas or water mains at hand, I am at a loss to know how to make the earth connection with the test-wire. Would any of your readers kindly inform me how, under the circumstances, I am to find a good earth-pole so as to complete the circuit and ascertain the true resistance of conductor?—HERBERT PICK.

[10364.] — **Estimating.** — I should be pleased if anyone could inform me of a good textbook on this subject. One dealing with methods enabling quantities to be priced when the p.c. of materials and labour are known, without the aid of "price books." I have one such as I mean, "Estimating," published by Batsford in 1883, but think there must be one of a later date, and treating the matter rather more exhaustively.—T. W. C. E.

[10365.] — **Sanitary Inspectors' Examination.** — What books are the best to prepare for examination in sanitary inspection?—W. EVANS.

[10366.] — **Enforcing Completion of Contract.** — Where employer and builder have got across, and the latter is required to do certain minor matters to complete his department, but refuses, saying he has done enough, and the work to be executed, if done at all, will have to be carried out by someone else, even if charged against him; what course should be taken by the architect, who, after offering the proprietor two alternatives, either to give the contractor notice, that if he does not complete the work stated within so many days, he will employ someone else, and charge contractor with same; or deduct the items in getting out final account (according to schedule of prices.) The employer replies that the alternatives do not meet his wishes, as he is determined the work shall be completed according to contract by the contractor, and does not intend paying balance until it is certified complete by architect.—PERPLEXED.

[10367.] - **Strains in Roof.** — How are the strains in a framed structure, such as a roof, determined by the method of sections?—G.

[10368.] — **Portland Cement.** — Will some practical reader give a specification for Portland cement in which its fineness, tensile strength, and other qualities are stated? What are the tests?—CLERK OF WORKS.

[10369.] — **How to render Brick Walls Impervious.** — Is there any cheap solution for using over walls that admit wet? An answer will oblige.—A. L.

[10370.] — **Fences.** — Is there not a rule that directs how a wooden fence is to be put up between two owners? On which side of the rails should the hoarding or pales be placed?—IN DOUBT.

[10371.] — **Coulomb's Theory of Retaining Walls.** — Will any reader explain the nature of this theory?—ENGINEERING STUDENT.

REPLIES.

[10344.] — **Coke-Breeze Concrete.** — For lime coal read "lime core."—C. F. M.

[10350.] — **Spires: their Design.** — "Cyrus" should communicate with Messrs. Fambrini and Daniels, of Lincoln, as to his third question.—J. D.

[10352.] — **Modelling.** — "A. D. W." should write to "Modellers," 69, Canwick-road, Lincoln, who will supply the information he requires.—J. D.

[10354.] — **Steps to Chancel and Altar.** — Top step under altar should be 2ft. 9in. or 3ft., two next steps 2ft. 3in. each, room for passing takes from 3ft. 6in. to 4ft.; rail, if any, is best on a step centring about 6in. in from edge, kneeling step at least 18in. wide, communicants' platform 4ft. 6in. or 5ft., to admit of passing without disturbing kneelers. Three steps down to space between choir-stalls, and about four more to nave floor raises the number to 12, which at a rise of 6½in. places altar at sufficient height for dignity without sacrificing it by fussiness. Less dimensions than above render genuflection difficult without improprieties. Priest's knee should not scrunge the altar frontal, and his toe should not slip off the top step. The servers should not smash their knee on the edge of the footpace, or graze their insteps on the next step. Administrants should not be compelled to mount the next step to let assistants pass. Communicants should not be jostled or have their feet disturbed by passers-by. Where less room is allowed and more steps are introduced and deeper risers are provided, or overhanging treads, the apparent dignity may be discounted by positive inconvenience. To genuflect, the body should be vertical throughout the operation—the left knee being lowered to the ground beside the right ankle. Taller people require more room than shorter

ones for this; but where room is insufficient it is better to omit the step than to entail a lasting annoyance.—H. W.

[10359.]—**Intercepting Chamber.**—"Gordon's" about the best. Fix it in the area and carry up a shaft from same to the level of the back of footpath, finished with a conical top.—C. J. K., Acton.

[10359.]—**Intercepting Chamber.**—A "Young Architect" asks where is the best place in the front area of a house for placing "the intercepting chamber." He forgets to ask first, is an intercepting *chamber* really necessary? There ought to be an intercepting *trap* placed on the line of the drain in the area, but it is not always necessary to place this trap inside a chamber. In many cases, especially where the trap is only about 2½ft. deep or so, it is a pure waste of money to build a chamber round it. The money so spent would often be better laid out on some provision for simply ventilating the parlour or bedroom. The intercepting trap should be placed outside of the wall of the house with provision for access easily to it; but its fresh-air inlet may be some feet away from the trap as most suitable. The trap used should be one that will readily show any water falling into it when any sanitary appliance in the house is used. If a "Young Architect" has read Hellyer's and Buchan's books on plumbing and house-drainage, he should be able to choose the style of trap he wants.—W. P. BUCHAN.

STATUES, MEMORIALS, &c.

GLASGOW.—On the occasion of the annual official inspection of the parks on Wednesday week, the Doulton Fountain on the Green, and the Steven Fountain, in Cathedral-square, were inaugurated. The first-named fountain, which was formally presented by Sir Henry Doulton, has been erected midway between the Court-houses in Jail-square and Nelson's Monument. The whole is in terracotta, and for size and elaboration of treatment it is without precedent. The style is that of Francis I. The circle of the outer basin-rim is 70ft. in diameter, the pedestals, of which there are twenty four, making the total width still greater. On eight of the pedestals large vases are placed. Eighteen feet from the ground is a large basin curving out to a diameter of 22ft. Below this, within four main arches, are four large groups representing the Colonies, and between them, four intermediate niches, the openings of which are filled with tracery. Above this basin and supported on a terracotta structural dome rises a superstructure. Around the central shaft are four niches for statues, and bracketed out above them is a wide projecting cornice. Seated above this, in the divisions formed by four pierced screens, are four female figures, holding vases from which water is pouring. The screens terminate below an enriched pedestal which supports a statue of the Queen. The total height is 46ft. With the exception of the four figures pouring water, which are of a purely decorative character, the scheme of sculpture is arranged to represent the Empire. All the figures are above life-size. On the base of the fountain are modelled the arms of the city of Glasgow. The design and working drawings of the whole erection have been furnished by Mr. A. E. Pearce (designer to Doulton and Co.), and the modelling has been carried out by a staff of artists under the supervision of Mr. W. S. Frith. The fountain was originally erected at the Glasgow Exhibition, 1888.—The spray fountain which Messrs. M'Dowall, Steven and Co., of the Milton Iron Works, have presented to the city, was also a feature of the Glasgow Exhibition, and was handed over to the Lord Provost by Mr. Hugh Steven. It is 20ft. 3in. high, and 28ft. 6in. in diameter. There are three basins, the largest of which, cast in one piece, is enriched with carved work. The second basin is in the form of a gigantic shell; and the third is plainer than the others. The ground basin has a concrete bottom, and there are a couple of drinking fountains. The ornamentation over the whole erection is illustrative of marine life, vegetable and animal. There are about 100 jets, which are fed by taps from the outside.

Mr. F. W. Hunt, of York-place, W., is the architect of a new branch bank at High-street, Kensington, for the London and Westminster Bank. Mr. B. E. Nightingale is the builder.

After enlargement of the Wesleyan Chapel at Mansfield it was reopened on Sunday. The alterations consist of taking into the chapel the vestries at the rear and removing the organ, and accommodation is now provided for 1,000 persons. The work has been carried out by Mr. William Eaton, of Derby, from plans prepared by Mr. John Wills, at a cost of about £700.

The Whitwell Steam Sawmills, Whitwell-road, Plaistow, owned by Messrs. Matheson and Co., timber merchants and builders, were gutted by fire on Friday. The workshops and sawmills and a large zinc shed were totally destroyed. The damage is estimated at £2,000.

Sir Frederick Abel, the President of the British Association for the year, in his inaugural address at Leeds on Wednesday evening, said the greatest strides made by science since the Association last met in Leeds in 1858, had been in electricity, and sketched the more recent developments and applications of that agent.

LEGAL INTELLIGENCE.

RE F. G. HELMORE.—A first meeting was held last week, the bankrupt being described as late of Paternoster-row, and elsewhere, surveyor. He returns his liabilities at £1,749, and estimates that he has a surplus of £1,340. It appears that the debtor previously failed about nine years since, and obtained his discharge; he has since been engaged in other occupations, and has no fixed employment at the present time. He has also been a coal and tea dealer and a solicitor's clerk, and has carried on a Home for Waifs and Strays, which, however, was stopped by the Charity Organisation Society. The resolution was passed, and the Official Receiver will wind up the proceedings.

WHAT IS A BUILDING?—A case of interest to builders and advertisement contractors was heard at the Sunderland Police-court last week, which arose under the Sunderland By-Laws. Latterly, a company, known as the Sunderland Advertising Company, have erected hoardings in various parts of the town, which are now covered with tradesmen's posters, and William Carter Slaughter, manager for the company, was charged with having erected a new wooden building contrary to the Borough by-laws, as a test case. The town clerk, Mr. Bowey, said the erection in question was at the north end of Toward-road, adjoining the Victoria Hall. It was from 13ft. to 19ft. high, and externally was used for advertising purposes, and internally as a joiner's shop. There was no roof, but he did not think it could be contended that an erection was not a building because it had no roof. Similar constructions had been erected in other parts of the town. Mr. Taylor, surveyor, said that each side of the building was 66¼ft. long. Before the date of the alleged offence there was a fence of about 7ft. high round the space where the present erections now stood. No plans were submitted to the Corporation for the building. Cross examined: The previous wooden walls were used as an advertising station. Bills were posted on the east side. In some parts 5ft. and in others 11ft. had been added to the old fence. The shed which was now used as an office was there before, and the place was used as a stonemason's yard. For the defence, Mr. Strachan contended that this was not a building; and, secondly, if it was a building, it was not a new building. His clients felt that they must resist this action, because it was only one building out of a number. Walls, roofs, and chimneys were required for a building, and this had neither roof, chimney, nor floors. He contended that plans were not required for this erection. It had never been decided yet that a wall was a building by any court. He thought that this erection could not by any stretch be termed a building. The town clerk contended that a wall was a building if it was erected higher than was necessary for a boundary wall. In reply to the Bench, Mr. Bowey said there was no fixed height for a boundary wall. Their Worships had to use their own judgment. Mr. Bowey said that for boundary walls the Corporation had plans put before them. After retiring, the magistrates said their decision was that the erection was a new building, and fined the defendant 10s. and costs. Notice of appeal was given.

CHARGE AGAINST A TOWN SURVEYOR.—Walter Horne, late town surveyor of Worthing, who was summarily dismissed by the Local Board a short time since, appeared at the police-court on Friday to answer two charges of feloniously stealing money belonging to his former employers, and was committed for trial to the Quarter Sessions and admitted to bail. It was the duty of the accused to prepare weekly wages-sheets, and to obtain a cheque for the gross amount and make the necessary disbursements. Evidence was given that on four occasions, only a portion of the cartage money was paid, the balance, about £36, being appropriated. The accused reserved his defence.

At a meeting of the Wedgwood Institute Committee on Monday, Messrs. Ford and Slater submitted plans for an enlargement of the building, at an estimated cost of £3,000. The plans, which were adopted by the committee include the provision of accommodation for technical classes.

A new Girls' Home has been erected at Forest Hill, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilators, and fresh air admitted by their improved air inlets.

At the Trades Union Congress on Wednesday, a resolution was passed, after much discussion, condemning the system of contracts by schedule adopted by the Government and other public bodies, as being conducive to low wages and other evils, and the Parliamentary Committee were instructed to obtain the insertion of a clause in all contracts prohibiting sub-letting and the giving of contracts to any firm which did not pay the recognised Union rate of wages of the respective localities.

WATER SUPPLY AND SANITARY MATTERS.

BRISTOL.—The works which have been in progress for the Bristol Water Company at Barrow, four miles from Bedminster Bridge, during the last four years will be completed in three months time. The new works comprise a storage reservoir, four filter beds, and a filtered water tank. The highest number of men engaged was 950; now there are only about 200 on the ground. The old Bridgwater Road ran almost through the centre of what will be the new reservoir, and its course has been diverted to the south for three-quarters of a mile. The storage capacity of the new reservoir will be 520 million gallons of water, and the deepest water will be 55ft. The water for this tank will come from Chewton Mendip, and a 30in. main has been laid for the purpose of carrying it. At Chelvey two wells are being sunk, and some of the water from them will also be pumped up into this reservoir. There are to be two 24in. mains from Barrow to the Victoria reservoirs at Clifton. One of them has been laid as far as Bristol Bridge, and connected with the main laid from Sherborne spring, near Chewton Mendip; the other has been laid a part of the distance only. The four new filter beds and the filtered water tank are complete. The cost of the filters has been about £30,000; the expenditure on the reservoir will be about £150,000. The engineers are Messrs. John Taylor and Sons, 27, Great George-street, Westminster, and the superintending engineer is Mr. George Gooch; the contractor is Mr. Thomas Oliver, of Horsham, Sussex.

CLONMEL WATERWORKS AND SEWERAGE.—The Town Council of Clonmel, in Ireland, lately advertised two separate open competitions for the best schemes for the waterworks and sewerage of the town. An eminent London engineer was engaged as assessor, and acting on his advice the committee have unanimously declared the schemes drawn out by Mr. W. H. Radford, C.E., Angle-row, Nottingham, to be the best in both competitions. The Town Council this week decided to carry out the waterworks at once, under Mr. Radford's superintendence. In the waterworks scheme Mr. Radford proposes to bring the water by gravitation from a mountain stream at Glenmorgan, having a watershed of 1,700 acres, the intake being situate about three miles from the town. The population to be supplied is 12,000, and the estimated cost of the engineering works is £11,000. In the sewerage scheme Mr. Radford proposes to lay new pipe sewers in every street, the sewage being brought down to the outfall works by gravitation. The estimated cost of the engineering works is £8,000.

THE DISPOSAL OF THE SEWAGE OF LONDON ON THE MAPLIN SANDS.—At the Sanitary Congress at Brighton on Thursday of last week, a paper was read on this subject by Mr. Richard T. Grantham, M.Inst.C.E., who proposed to reclaim a large proportion of the Maplin Sands, and to distribute the sewage of London over the reclaimed surface. He feared that if the chemicals now used did not sufficiently clarify the sewage, the discharge at Hole Haven would cause as great a nuisance to the river there as it had done higher up. He therefore proposed to conduct the sewage away to the Maplin Sands as more advantageous than the alternative of utilising it on Canvey Island, in being further removed from any seaside resort, being larger, and in course of time making an addition to the agricultural area of the country, instead of absorbing any part of it. The surplus excavation for the culvert would be utilised in forming the enbankments of the area of the Sands proposed to be reclaimed, which was estimated at 10,000 acres. The cost was estimated at £4,500,000 exclusive of purchase of land.

CHIPS.

The Duke of Clarence and Avondale has arranged to open the Liverpool Royal Infirmary, which has been erected from Mr. Waterhouse's designs at a cost of over £100,000, on Wednesday, the 29th of October next.

At the meeting of the Dundee Parochial Board on Tuesday, it was resolved to build a hospital for the sick poor on the ground behind the East Poorhouse. The hospital is to accommodate 300 persons, and the cost is estimated at £16,000.

At the Inverness Dean of Guild Court on Monday a warrant was granted for the erection of a new church for the Free North congregation in Bank-street, Inverness. The new building, which is to be erected from designs by Messrs. Ross and Macbeath, will cost £8,000, and will give accommodation to 2,000 worshippers.

Another of the windows on the south side of Emmanuel Church, Weston-super-Mare, has been filled with stained class. The subject is "Christ Walking on the Sea, and Peter Essaying to go to Him." The window has been executed by Messrs. Joseph Bell and Sons, of College Green, Bristol.

Our Office Table.

THE death has been announced of Mr. John Belcher, F.R.I.B.A., of 7, Brunswick-square, W., the senior member of the firm of J. and J. Belcher, of Adelaide-buildings, London Bridge. He was an uncompromising Classic architect, and had for many years a large practice in the centre of City offices and warehouses, and also country mansions. He had served on the council of the Institute, of which he became a Fellow in 1856, and was also for some time member of the Board of Examiners appointed under the provisions of the Metropolitan Building Act. Soon after being joined in partnership by his son, he relinquished active participation in work owing to the impaired state of his health, and retired just twenty years ago. He has passed away at the age of seventy-three.

MR. BANISTER FLETCHER, who recently succeeded Mr. Robert Kerr as Professor of Architecture at King's College, London, is endeavouring to form an architectural and building museum at that College. Casts are being made of good examples of Egyptian, Classic, Gothic, and Renaissance work, while specimens of building materials, sanitary appliances, and models are being brought together all labelled with the names of the manufacturers and prices affixed. The new session will be opened on Friday evening, Oct. 3rd, by a free public lecture, to be given by Prof. Fletcher, entitled "Architecture: the Pleasure Derived from its Study." In the corridor adjoining the lecture room the Worshipful Company of Carpenters are fitting up cases for the reception of models of roofs, floors, framing and joists, and for books, which will form a branch of their reference and lending library, now exhibited at their hall in London Wall. The Carpenters' Company are also spending £600 from Harben's Gift in building a room at King's College for the classes in wood-carving about to be conducted under their auspices by Messrs. Barnes, Curran, and Howard, all practical wood-carvers, and £150 in improvement to the carpenters' workshop at the College.

THREE important autumn exhibitions of pictures have been opened this week in Birmingham, Liverpool, and Manchester respectively. That in the first named city, organised as usual by the Royal Birmingham Society of Artists, and to which the public were admitted on Monday, is stronger in elements of popular attention than any previous display brought together there, many of the works having, as a matter of course, already been seen at Burlington House, in the Regent-street or Bond-street Galleries. A marsh landscape from Yarmouth, I.W., by Henry Moore; J. C. Hook's "Breakfast for the Porth"; E. A. Waterhouse's "Mariamne," hung at the Academy three years since; W. B. Richmond's dreamy composition, shown at the New Gallery this summer without a title, and now named "Venus and Anchises"; the "Sandah," by Hagnes Williams; and portraits by Luke Fildes and the Hon. John Collier of their wives, and that of Cardinal Manning by W. W. Ouless, are among the more prominent works. At the Walker Art Gallery, Liverpool, Frank Dicksee's "Redemption of Tannhäuser," Leighton's "Bath of Psyche," Collier's "Death of Cleopatra," and Albert Moore's "Moonlight" are the most conspicuous features recently seen at the Academy. Sir Arthur Clay's immense and glaring work, "The Court of Criminal Appeal," which we criticised in May last when on view at the Grosvenor; Solomon's "Hippolyte"; Herkomer's versatility is shown by a portrait and landscape; and among the rest Messrs. Stanhope Forbes, Alfred Parsons, and Anderson Hague are well represented. The large water-colour room has been hung with self-coloured sacking, with a frieze and dado of terracotta, and on this surface some of the principal pictures are arranged irregularly, with wide vacant spaces between. The Manchester Exhibition opened at the City Art Gallery on Tuesday, and is also a good show. Orchardson's picture of himself, painted for the Uffizi Gallery; Logsdail's "Lord Mayor's Show"; "A Poor Catch," by Napier Hemy; "The Youthful Jesus," by Holman Hunt; landscapes by Edwin Ellis, J. R. Reid, and David Murray; and portraits by Fildes (Mrs. Agnew), Wells, and Collier are the chief works.

THE Town Council of Edinburgh are economising the expenditure on the maintenance of streets. Last year ending in May the committee estimated they would require for their work a sum of £50,830. They actually spent a sum of £47,190, thus saving over £3,000. The committee estimate that for this year they will require £43,115, an amount showing a further reduction of expenditure of about £7,000. This reduction is due to a general retrenchment, especially that for the estimated work. While adjusting the estimates the committee authorised their convener, Councillor J. C. Dunlop, to adopt two new systems in the carrying out of their operations. Dissatisfaction having been caused by the use of sand foundations and gravel joints in the causewaying of the streets, a solid concrete foundation is now to be adopted, and is used in English and Continental towns. The other new system to be adopted is the paving of level streets with wood. The convener of the committee is greatly in favour of the use of wood, and the London system of paving with this material and concrete foundations and cement joints will be followed.

THE United Asbestos Company have received the following letter from the lessee of the Queen's Theatre, Manchester:—"You are aware, no doubt, that my theatre has just been destroyed by fire, which gave me a practical test of your Asbestos 'Victor' Metallic Fireproof Curtain, put in some time ago. Although for a long time the extent of the fire on one side of the curtain was so great that it must have been red-hot, it remained intact, and the stage was saved and the stage stock uninjured. Had it not been for the curtain, this part of the theatre would have been as big a wreck as the other." This was the first occasion on which a "Victor" metallic drop curtain has been severely and practically tested, and justifies the claim of the company as to its fireproof character.

CHIPS.

Tenders were laid before the Chelmsford Town Council on Wednesday week for painting the market pens. The highest was £65, and the lowest £21.

The Royal Infirmary, Wigan, is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

Mr. J. Powell, J.P., died at his residence, Westwood, Harrogate, on Friday. The deceased gentleman, who was in his 77th year, had carried on an extensive business as a land agent and surveyor. He was Past-President of the North of England Surveyors' Institute, and had been agent for the Roundell family for the neighbourhood of Ripley and Harrogate for over fifty years.

The reservoir by which the local board of Castleford supplies the town and district with water by gravitation was suddenly emptied on Monday, it is supposed by the percolation of the contents through the sandstone bottom into a disused colliery working. Fortunately it was possible to supply the neighbourhood with a direct service from the pumps, and also to connect, in case of necessity, should a fire break out, with the Wakefield mains.

On Friday special services were held in St. Matthew's parish church, Ipswich, to celebrate the unveiling of the new east window. The work has involved the putting in of new masonry, and the window is now a well-proportioned five-light structure, with tinted cathedral glass in four of the lights, and a stained-glass representation of Christ seated in glory in the centre. The stained-glass work was executed by Messrs. Ward and Hughes, London, whilst the masonry has been carried out by Mr. T. Thwaites, builder, Ipswich. The cost of the work was £125.

The town council of Plymouth have accepted tenders, amounting in all to £2,400, from two local firms of builders, for alterations to the Guildhall, in accordance with plans prepared by Messrs. Hine and Odgers, of Plymouth.

The town of Castle Douglas, N.B., is about to be sewered in accordance with plans prepared by Mr. James Barr, of West Regent-street, Glasgow. The local board have accepted for the execution of the work the tender of Mr. Pearson, of Kilmarnock, at £2,600, being the lowest of nine sent in, and £83 below Mr. Barr's estimate.

The Suffolk Institute of Archæology held their autumnal meeting in Ipswich on Wednesday week, when the Museum, Town Hall, and many of the churches were visited. On the following day the members united with the Essex Archæological Society in a joint meeting at Harwich and Dovercourt.

Trade News.

WAGES MOVEMENTS.

DUNDEE.—The masons are still on strike. At a meeting of the men it has been resolved that before they resumed work a written agreement must be drawn up and signed by representatives of the masters and men to the effect that the wages should be 7½d. an hour for hewers and 8d. an hour for builders, these rates to be paid till the 1st of April, 1891.

COVENTRY.—The strike has closed, the men having recommenced work on the understanding that the masters will refer the question of advance to arbitration.

HOUSE-PAINTERS' AND DECORATORS' GRIEVANCES.—A mass meeting, attended by some 4,000 persons, was held on Sunday afternoon in Hyde Park, in support of the House-Painters' and Decorators' London and Counties Trade Society, to arouse the painters and decorators to the need of combining, and also for the purpose of denouncing "the mischievous introduction of sweating by unprincipaled employers, which has reduced the trade to its present pitiable plight."

STROUD.—The carpenters and joiners of Stroud are taking preliminary steps to combination. There is just now considerable activity in the building trade of the district. New schools for boys, a school of art and museum, and a new hospital wing are in progress, or about to be commenced, and houses are going up in several quarters.

The town council of Stafford adopted on Tuesday plans for public baths prepared by the borough surveyor. The baths will be built near Green Bridge, and are estimated to cost £6,000.

Mr. C. J. Phipps, F.S.A., is the architect of the new Vaudeville Theatre rebuilding in the Strand, and Messrs. Hall, Beddall, and Co. are the contractors.

A pastoral staff was presented to the Bishop of St. Asaph, at the Diocesan Conference at Oswestry yesterday (Thursday). It is of silver gilt, jewelled and enamelled in parts. It bears the arms of the See, and an engraved inscription in Welsh.

The twin churches of St. Breage and St. Germoe, in West Cornwall, are undergoing restoration; the contractor for both being Mr. James Julian, of Truro. In the former church a coffin was discovered under the floor, which was shown by the inscription on the plate to be that of the Mrs. Margaret Godolphin eulogised in Evelyn's biography. An altar tomb is to be built over the grave, on which the epitaph and family arms will be reproduced.

Holloway's Pills are specially adapted for the young and delicate; their gentle and purifying action ranks them above all other medicines. In indigestion, nervous affections, gout, and rheumatism these Pills have achieved for themselves universal fame. They expel all impurities from the blood, and thus restore cheerfulness and vigour.

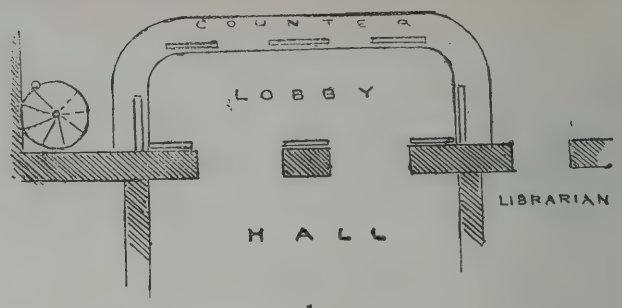
SUB-CONTRACTING AND PIECE-WORK.

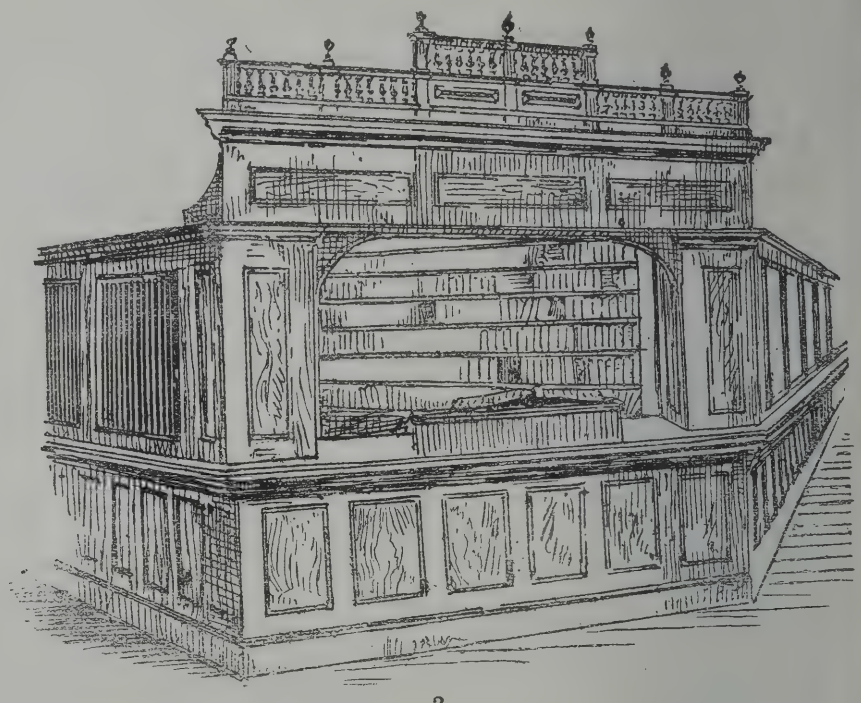
THE Trade Union Congress, which has been busy at Liverpool and has discussed a number of questions, appears not to have accomplished much in settling the disputes that at present divide masters and men. Protests have been made condemning the system of Government contracts, which are no doubt subversive of public interest and degrading to labour; the letting of large works to "sweating" firms, contracting by schedule, which conduces to cheap labour, sub-letting and other matters, but the speakers have in some of these cases been confounding their abuse with the things themselves. Take, for instance, sub-contracting. It was strongly objected to by the trade unions. Why? Because it encouraged piecework, and led to an unequal rate of wages. But does it not hold out to the able worker and craftsman a position which he cannot obtain in any other way? Those who protest against sub-contracting do so on the ground that the sub-contractor "searches all over the country for the swiftest hands, and pays them more than the proper rate of wages, thus leading other workmen, who are paid less, to scamp the work." But how can this inequality be avoided? We cannot bring men all to one dead-level of intelligence and productive skill. Sub-contracting has no doubt its weak side in the eyes of the general contractors, and the recent deputations from the London United Building Trades Committee to the Council of the Institute show how strongly the trades hold to the traditions. As our readers know, three propositions were then made. Architects were invited first to insert in the conditions of contract that the contractor is not to be allowed to sub-let any portion of the work; second, that all the labour employed is to be of the best quality; and, third, that the contractor shall not pay less than the recognised or trade-union rate of wages. The reasons why the contractor should not be allowed to sub-let are—(1) that employers and architects should retain their power under the terms of the contract, it being feared that the sub-contractor would be inclined to evade the specification and become responsible only to the contractor; (2) that inferior work would be tolerated. No doubt there has been some ground for these objections. A sub-contractor, unless bound by the same conditions as the contractor, might be tempted to introduce inferior material and labour, but there is no reason why he should be able to do so. The contract can make it compulsory that all underlet work should be subject to the specification, and be approved by the architect. It is only a matter of agreement. Sometimes the sub-contractor supplies both materials and labour; sometimes only the labour, but whichever he does, the architect has as much right to insist upon the proper carrying out of the work as he would have under the day-work system. The argument, then, against piecework is fallacious, and only holds good when sub-contracting is allowed to be carried on in contravention of the specification or contract.

If better skill or swifter hands can be obtained by sub-contract, why should not the employer obtain the advantage? Only the large contracting firms are able to employ picked hands in the several trades, and to keep them all the year round; the majority of builders are unable to do this, and when they take a contract are at a decided disadvantage unless the contractors employ tradesmen who are skilled in a particular trade. This is their only chance of competing with more wealthy competitors in the trade. The employer cares little if his work is skilfully done; the architect, too, has only this object in view. Why should they, therefore, object to a system which, under proper conditions, affords a guarantee of the performance of skilful workmanship? It seems to us that this is the upshot of the whole question. In an age of free trade a uniform rate of wage becomes an anomaly. If a specialist bricklayer can do his work quicker than another, and quite as skilfully, why should he not reap the advantage? In this trade piecework is often resorted to; the general contractor supplying the bricks and mortar. The work is done according to the specification, and under the supervision of the architect. The sub-contractor is a master bricklayer, who employs a number of hands. They are in "touch" with him, and can do the work quicker than many employed promiscuously under the foreman of a builder. He works with them constantly, and sees that no time is lost. Experience has shown that special work done under this plan is often superior to the average contract work. Overtime is made; the wage is often, therefore, more than that under day-work, and the contractor gets the benefit. Gauged work is frequently sub-let with decided advantage to all parties, as the contractor saves, the employer obtains good work, and the workmen earn better wages. And these results are due to specialism. The sub-contractor knows his particular branch of the trade so well that he has acquired a quick hand and eye, he knows where to get the expert hands, and the work is turned out quicker and better than if done by the ordinary craftsmen. Why should not the artist in brick, who can cut and carve it without unnecessary labour, obtain a higher wage than the ordinary brick-setter? But the unionist tradesman of average ability, who works in a groove, says he ought not to do so, as it is unfair to others of his craft. Why? Because the unionist cannot work so skilfully, or will not make extra hours. A superior position is won by even a bank or tradesman's clerk. Why should not the art craftsman have the same chance? No; of all workers he, by his own preferences and inclination, is not to have the opportunity of raising himself, but to remain at a certain level, receive a uniform wage, and remain loyal to his society. By agreeing to the rules of his union, he binds himself down to a certain *régime* and position. Trade-unionism is no doubt an advantage to the majority in the trade—the rank and file—because it assists them to uphold a given rate of wages; but its great function is that it promotes the welfare and thriftiness of its members. Inferior workmen are gainers, because they have everything to win by becoming members; on the other hand, the restrictions and rules are irksome to those in the trade who wish to reach the contractor's position, and who aspire to something above their fellows. Take masons' work. How many expert masons are desirous of winning their way to a higher position as a tradesman, and who would gladly undertake the stonework of a building as a sub-contract? Having more room and plant, a mason can do better work than the general contractor by employing ordinary masons. It is a convenience for both parties; but the condition that "no part of the contract is to be sub-let" deters this practical mason from getting small contracts. And is the same thing not seen among another important craft—that of the carpenter and joiner? Let us imagine a contract for a large building, a club-house or a mansion, in which high-class joinery is necessary. The general contractor is unable to keep employed a sufficient number of skilled joiners or specialists as staircase hands, or superior artistic joinery hands, to put on the building; but there are those who make it a trade to employ specialists and to turn out high-class joinery and moulded work. They employ such hands permanently, and have the facilities for executing ornamental staircases, interior doors, over doors, dadoes, chimneypieces, and overmantels. Surely it is to the advantage of an employer if he can obtain such workmanship; it is equally to the advantage of the contractor if he can sub-let this portion of the work. We need hardly say the architect prefers the handing over of artistic work to a specialist. The men employed to work for the specialist are paid the highest wages, and are regularly employed. We know, for example, what excellent doors, chimneypieces, staircases, and artistic joinery in the Queen Anne style were turned out in Mr. Norman Shaw's houses by the late Mr. Lascelles, who contracted for this portion of the work. In contracts for churches, both the late Sir G. G. Scott and Mr. Street arranged with sub-contractors for stone carving, church furniture and fittings, brasswork, and painted glass. Such special art workmanship as that required for a reredos, or for choir stalls and pulpit, could not be safely left in the hands of ordinary workmen to be done by daywork. We know, also, that the engineer, the founder, the plumber, the electric-lighting engineer, and the decorator have become specialists, and these branches of building contracts are generally sublet to firms who devote their whole time and attention to the work, and employ men who receive the highest wages. Would it be possible to get the work done so expeditiously or reasonably by a contractor employing miscellaneous hands? Only the great firms can employ their own master plumbers, engineers, and electricians; but even these would work under a disadvantage compared with firms who occupied their whole time in the work.



Employers and architects have at least to accept the inevitable. The whole tendency of trade is towards specialism, and if the best and cheapest labour is to be employed, sub-letting appears to be the only mode of securing it. A uniform daywork rate appears to be unjust towards special art craftsmen. The mass meeting held last Sunday week in Hyde Park by the London and Counties House Painters' and Decorators' Trade Society supplies us with an example. The speakers advocated a uniform rate of payment of 8½d. per hour for house painters, against which we have nothing to say; but if plain house painters are to be paid this rate for laying on four coats of colour and flatting, the decorative painter is certainly worth more for "graining" or "marbelling," and as the decorative art craftsman in painting deservedly ranks higher than he who merely imitates wood or marble, he should receive a still better rate of pay. We may ask, in conclusion, why it is that the modern contractor's work falls so far short artistically of the older craftsmanship. The reason is that in Mediæval and in the earlier work of the present century the trades were independent, and the system of separate contracts or piecework prevailed. Each craftsman was under the direct control of the architect, who undertook the part now occupied by the contractor in selecting tradesmen of skill to carry out the building. The control is now vested in the capitalist contractor, who ought certainly to have the right under a properly-prepared specification and contract to select fitting men.

FREE PUBLIC LIBRARIES.—IV.



IN our last article (p. 138 ante) we discussed the requirements of the planning of libraries, and referred to the three systems

of shelving and stacking the books. We now intend to make a few remarks on the details and fitting-up of libraries. In the planning of reading rooms, the principal object to keep in view is the number and distribution of the tables. These may be placed with their ends to the windows and project transversely into the room, when the width of room is limited, or they may be placed, independently of the walls, in the centre of the room with a passage-way all round, which ought not to be less between the tables than 6ft., and at least 4ft. between the ends and the walls. These spaces will regulate the sizes of the tables, which may accommodate from four to five readers on each side. Opinions may vary as to the desirability of small or large tables: we should say a table that will seat eight or ten readers round it is quite large enough for convenience and comfort. According to one estimate, at least 2ft. of elbow-room should be given to each reader. At Wolverhampton the tables designed by Mr. Elliott, the librarian, are each 8ft. long, with sloping desks, the periodical being fixed in position by means of a brass rod down the centre of the paper, and its name is painted on a ridge which runs along the table. The arrangement prevents the removal of the journals; but for general readers this fixing is, to say the least, somewhat inconvenient. At Birmingham the circular-roofed reference library contains three rows of tables transversely arranged, each table having seats for five readers on each side. Two passages traverse the length of the room. The Clapham library (see plan 3, page 139) shows the tables disposed in the centre of each room, each table accommodating ten readers, five on each side, the ends of them arranged towards the bay windows, in each of which there is a hot-water coil. The news-room is 57ft. by 27ft., and will accommodate 150 persons, there being 8 large tables, each large enough for 10 or 12 readers. An allowance of 15sq.ft. of space to each reader is proposed for reading rooms, and this area will include the tables and chair space. Some propose tables 2ft. wide for a single row of readers, the tables being made to face the counter, or assistant librarian's desk. The considerations we have advanced are those which ought primarily to determine the arrangement and number of tables in a reading-room. It is stated by one authority that a table 10ft. long by 3ft. wide is a convenient size. We should say 3ft. 6in. would be a more convenient width for readers on both sides, especially in reference libraries. In the latter rooms, as notes and transcribing are often necessary, the tables should be convenient, and sloped desks would be a desirable addition for students.

After tables the arrangement and construction of newspaper stands requires attention. These ought to be placed in good light, and at distances from each other that will afford a free passage round, say, 6ft. 6in. or 7ft. from centre to centre. The unit in the determination of length should be an opened newspaper of the ordinary size; thus, if there are two newspapers on the stand, or slope, there should be at least 3ft. (taking the width of the pages of the *Times* as a guide), but in addition to the exact width of the newspaper laid open, there should be a margin of space between, say 9in. or a foot, in which case the stand would be about 8ft. long, for two newspapers on each sloped side. Many of the stands we have seen give 3ft. 9in. to each newspaper. The sloped desk with triangular ends should also be of sufficient height to take the newspaper or about 2ft. 6in. measured on the slant, and about 1ft. 8in. width of base. The desk is supported on standards resting on a foot-piece about 3ft. high. The importance of determining the dimensions of the stands is evident when we come to set them out economically, the spacing of the windows and, in fact, the size of the news-room must be regulated by the reading-desk, which should be placed at right-angles to the windows. Allowing the distance between we have mentioned, there will be sufficient passage-way between the readers of two stands. The windows ought not to be less than 4ft. 6in. from the floor, as this height is better for lighting, and prevents the habit of lounging and looking out of the windows. Indeed the higher they are the better. The magazine room requires tables, and these might be 3ft. wide and 6ft. apart, allowing 14ft. to each reader as about a fair area. Quoting Mr. Mountford's paper on book accommodation: "For the reference library and its stores, six volumes might be calculated to the lineal foot of shelving. For the lending library, eight volumes to the foot.

1

2

Mr. Robins says nine and ten books respectively. The height of cases being generally fixed at 8ft., and containing eight shelves, the requisite length for any given number of books might easily be calculated." In calculating the size of the reference library, the architect has to set apart the depth of a single bookcase round the walls, and a rail placed 3ft. in front of the shelves as a passage for the assistant. This lining of the walls with bookshelves to a total width of about 4ft. 4in. leaves the available area in the centre for the readers. All the wall space should be utilised by book-shelves for 7ft. to 8ft. in height; if there are aisles, they should be planned wide enough to admit each side to be backed by books, an aisle wide enough for two faces of books, but having only one side utilised by shelves is wasteful. All these book faces or shelves should be set out in pencil on the plan with their proper aisles or passages. No shelf should exceed 3ft. 6ft. in length without a support, nor be less than 8in. in width, as it is found that longer shelves bend under the weight of books, besides which, the infrequency of uprights or supports makes the task of storing and supporting the books irksome. On this account 30in. is considered a convenient length for a shelf.

We may next refer to counters and indicators. We have already shown the position of counters in the lending library. In plan they may be straight across the compartment, or room, or hall, or be curved inwards, so as to give a more convenient lobby for the public. Our plan 1 represents a lending library counter made to project into the room with return sides the whole width of the hall—a convenient plan that gives more frontage, and facilitates a keener super-

vision by the assistant. A height of 32in. and a width of 18in. to 20in., are the usual dimensions, though the top should be 2 wide if there are no indicators, and a fe inches higher. The form and size of t indicator used, and the amount of lendin of course, ought to determine the necessa length of counter. The counters have t usual flaps and wickets to allow the atten ants to pass to the outer side, and are fitt up on the inner side with shelves a drawers to suit the convenience of t librarian. The kind of indicator used w determine the fitting up of this part of t library. Several descriptions are in u We may here describe two forms employe The Elliot indicator is a square case frame divided into vertical columns, the bo numbers being arranged in them on sm pigeon-holes or shelves. When a book issued its number and date are written on t

CHIMNEY CORNER AND POLISHED IRON FIRE DOGS AT "THE HOLLIST ARMS" LODSWORTH. SUSSEX.

borrower's ticket, and placed on the shelf opposite the numbered space, where it remains till the book is returned. Thus the person can see at once by the ticket that the book is out. Its size is 3ft. square for every 1,000 volumes. The Cotgreave indicator is an iron frame fitted with shelves of the number of books recorded, a small metal-cased edger being placed on each shelf numbered at both ends in different colours, blue and red. When the blue end is turned toward the public the volume is in stock, if red the book is out. The indicator occupies a space of 1ft. 6in. for every 5,000 volumes. This form of indicator takes up little room on the counter, and has a means provided for detecting books which have been kept beyond the allowed time. Slides or clips are used to cover the numbers issued at certain periods, and these are denoted by different colours, so that the presence of a particular coloured slide remaining of the earlier period indicates that the book is overdue. Our sketch of the counter and indicator arrangement of the lending library at Darlington shows an example. The indicators should be arranged so as to allow ample counter space at intervals between them; and it is needless to say these arrangements can be varied to suit the form and length of the counter. The reference library counter ought to be at least 2ft. wide and 3ft. high. Other forms of indicators and details, bookcases, lighting, ventilation, and warming arrangements will be noticed in our next article.

OLD CHIMNEY-CORNER, LODSWORTH, SUSSEX.

THIS quaint old cottage chimney-corner, of which a sketch is herewith given, is an eminently typical one. The fire-dogs were made about 80 years ago, and were wrought by a blacksmith in the village. They are of polished iron, not steel, as mentioned on the sketch.

CECIL ALDIN.

NOTES FROM EDINBURGH.

THE summer months have been a season of much activity in the building trades in all parts of the city, happily unaccompanied by any disputes as to the rate of wages, and there are no indications of any number being unemployed. The mason work of the new Solicitors' Library, which is also an extension of the Advocates' Library, is nearly completed, and forms a very conspicuous feature in the long, dingy perspective of the Cowgate as seen from George IV. Bridge. From this point of view the better architectural detail, confined to the upper story, is more on a level with the eye, and the library, with its parapet and oriels facing the Cowgate, makes a very good appearance, and does much to improve the aspect of the ancient thoroughfare, which has no inviting look from either the higher or lower level. The Free Library, on the other side of the bridge, has also made a good riddance of some dilapidated buildings. Jeffrey-street, which sweeps round from the High-street to the North Bridge, is now all but completed, the ruinous building at the bridge end having been reconstructed, though with much less architectural detail. The original design appears to have been departed from, as there is an unseemly break in the proportionable size of the tenements about the centre of the street. The new University Hall and tower have reached the eaves-line level of the main building, and the National Portrait Gallery will soon be ready to receive the antiquarian museum. The new addition to the Morningside Asylum has made rapid progress, and will become one of the most conspicuous landmarks of the southern environs of the city, where its extensive frontage—all in red sandstone—stands pleasantly out against the thickly-wooded crest of the hill on which it stands.

No alterations of any note have been made this year in Princes-street or other well-known thoroughfares, unless it be the painting in white of the extensive frontage of the Balmoral Hotel, very much to the displeasure of Professor Blackie. The example is one not likely to be followed. This particular fad for painting sometimes has a good effect on shop fronts, and in small surfaces; but the experiment on a very large scale is, fortunately, an expensive one. It is difficult to divine the grounds for selecting white or black. The former soon shows its dirty face only to the passer-by, and the effect of black as a prevailing treatment may be seen in the funereal gloom of the Princes-street Arcade, where it absorbs much necessary light.

The controversy between the R.S. Academy and its critics has slumbered since the last rejoinder of the Academy, and the judgment of the Privy Council will be awaited with some curiosity. The last reply did not throw any further light on the subject, or make any new proposals. The fact remains that the Academy has ever been, only in name, an Academy of Architecture. If any suggestions can make it more so, it will probably, for lack of funds, be but little that can be done; and the Art Schools of the Board of Manufacturers and Heriot-Watt College do something now to meet the demand for some specific teaching as to architecture. Much more is to be hoped for from the movement, recently inaugurated, for the erection of a University Chair of Architecture. This has met with the unexceptionable support of the profession. Without public opinion being educated in some way to understand and appreciate what is really good architecture, and what is not architecture at all, or architecture of inartistic character, the R.S. Academy could do little good, and the task of creating a desire for, and general knowledge of, the ordinary principles of architecture must always be the work of some specially organised school or method of instruction. Probably more of this general knowledge was diffused when all architecture was supposed to be confined within

the sphere of the Five Orders. But, what with the general diffusion, by photography, of all sorts of foreign examples, and the complexity and confusion of existing specimens at home, and the notion that all such things are merely matters of taste, it seems hopeless to expect intelligent appreciation of architecture as an art to become general or popular as a study, without some special and scientific source of instruction, which only a Chair of Architecture can provide.

The letter on St. Cuthbert's Church, in the latest issue of the BUILDING NEWS, is a practical illustration. The author has mounted his stilts, and has amused, if he has not edified, its readers with its curious collocations of "lang nebbit" words. His only sensible and relevant remark is that in which he affirms the indifference of the public as to whether the church is to retain its position in its hole or migrate to a higher level. A building committee of ancient Greeks or Romans would doubtless have put their foot on any proposal to build a city temple in such a site. The work, meanwhile, is interdicted upon other grounds, and as there is no appeal to a public educated up to any sensible degree in matters architectural, the decision of the Court of Session will end the controversy. Much is to be said for restoration on the old site, and the fine spire, which looks better in the landscape than any one of its neighbours but the dome of St. George's, would be greatly missed. If the somewhat simple and severe style of the spire were made the key to the style of reconstruction, instead of more florid Renaissance, the church would look very well even in its hole—some considerable portion being at the level of the eye in Princes-street; but "sectarian blindness and fetishism" are in no way concerned, and the restoration of the church in a style now suited to the site will not be "the destruction of the fairest part of the city," and "Disestablishment" would rather seem to favour its removal, and the interesting quotation from the *Daily Chronicle*—which seems to know as little as the letter writer—of the respect in which the Shorter Catechism and Confession are held, will not rouse the citizens to interest themselves in the matter. It will be news to most people north of the Tweed that the clergy are afflicted with intellectual paralysis, or that modern enlightenment, which is avowedly agnostic, is better in any respect than a course of study directed by the Shorter Catechism, where the authors of both article and letter will find much useful information, and the latter a lesson in logical coherence.

The city authorities, who were severely criticised last year for their expenditure upon streets and paving, have been taking measures to reduce the estimates and improve the method. Wood pavement they consider best for level streets, and granite blocks laid on cement for others. Experience of redwood blocks has not been satisfactory here. In wet and wintry weather they get very slippery, and dirty under foot, and last no time under heavy traffic. But in the division of Princes-street where the hardwood blocks have been laid for about a year, there is quite contrary experience, and some promise of better durability. The objection to concrete under the stone setts is the aggravation of the noise, which is very bad, as many vehicles are but indifferently hung. No paving equals asphalte in durability. The pavement in the Kirkgate of Leith, laid 20 years ago, though disturbed in many places for pipes, &c., is as sound as ever. It is noiseless, and if its slipperiness had been very bad it would have been removed long ere now. Some further experiment should be made with this material.

The fruits of the recent expenditure in the way of providing recreation grounds are every year more apparent. The northern suburbs will soon be in possession of a large and fairly level park extending from the western side of the Arboretum to the Fettes College grounds. The Arboretum is much improved, and contains a large selection of oak, thorn, &c., and with the Botanical Gardens, as a sample of landscape gardening, could not be surpassed. Large stretches of turf, which on the north side is like velvet, afford splendid views of the city and the distant hills, and are fully appreciated by old and young. Already a considerable amount of building has begun to cover the ground of the old park recently taken for building speculation. This is mostly tenements and shops, for middle-class requirements. Several villas in the same quarter are erected. Large blocks of smaller tenements have been built in the north-eastern suburbs, and the advantages of the northern suburbs, with their proximity to the city and the service of the cable tramways, are likely to promote further extension of the city in this direction.

THE BAPTISTERIUM AND DOMTHURM, CREMONA, AND OSPEDALE MAGGIORE, MILAN.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THESE two fine photographic illustrations are reproduced on a somewhat reduced scale, by permission, from a grand folio work just published by Herr von Ernst Wasmuth, the well-known and enterprising architectural publisher of Markgraffenstrasse, Berlin, under the comprehensive title of "Ziegelbauwerke des Mittelalters und der Renaissance in Italien," and the author of the book is Professor Heinrich Strack, of Berlin, who made a special survey of the buildings illustrated, and supervised the execution of the measured drawings prepared for his work. By far the larger number of the fifty plates thus brought together consist of these geometrical elevations and big scale details, all of which are delineated in a thoroughly practical and technical manner, carefully showing the jointings of the brickwork and terracotta enrichments which which the buildings are elaborated. Street's "Brick and Marble of the Middle Ages of North Italy," and Dr. Rowand Anderson's "Municipal, Commercial, and Street Architecture in Italy," have both in their way supplied some of the best and most reliable drawings yet published of the Mediæval buildings existing in that country, and of late years English architects have had the advantage of such books as Kinross's "Details of Italian Buildings, chiefly Renaissance," and Oakeshott's similar series of drawings, first published in our own pages when their author held the BUILDING NEWS Travelling Studentship a few years ago. The larger book before us is like neither of these works just mentioned, and it deals more especially with constructional ornamentation, as indicated by the title under the term of brickwork, some of which, however, is much earlier than the Renaissance period. Some Gothic examples are represented, such as the Palazzo Rocca-Salimbeni, Siena, with enlarged details; the Porta Ovile, the Porta Pispini, the Porta Romana, where the fresco of the Coronation of the Virgin by Taddeo Bartoli is shown to visitors; the Fonte Nuova, built in 1259, and the Fonte Branda, all in the same city. Added to these are more elaborate specimens still from the façades of the Palazzo Grotanelli—originally the Palace of the Captains of Justice, and now well restored by the late Sig. Rossi—and some houses and shops from the Via Ricasoli. Some highly characteristic details of Mediæval brickwork, too, are of course shown from the ancient town of San Gimignano, between Certaldo and Poggibonsi on the Siena railway, once one of the most prosperous places in Tuscany in the days of Dante, where the streets still carry us back to the Middle Ages. The Palazzo Pratelesi has some exceedingly refined details about it, and the proportions of its delicately cusped windows are specially pleasing. The circular tower of the Palazzo della Diavolo, Siena, with the pedimented chapel attached to the earlier main building are both here drawn most carefully, while the photograph accompanying the elevation shows the relative positions of the two buildings. From Pisa we have an example of early work subsequently added to in the Palazzo Agostini, now used as a café. Of church work, amongst other examples, we are presented with measured plates showing St. Anastasio at Lucca; then comes the famous porch from the Palazzo della Mercanzia or Loggia de' Mercanti, at the corner of the streets SS. Stefano and Castiglione at Bologna. It is a well-known and beautiful piece of work, said to have been erected in 1294, and was restored by Bentivogli in 1493. The Palazzo Fava, from the same town, is one of the most adaptable as well as remarkable instances of good brick treatment, which has frequently been copied in English modern erections. It is here shown in company with the similar buildings at Bologna, familiar as the Palazzo Pallavicini and the Casa Vecchietti. Bramantino's magnificent court in the Palazzo Bevilacqua Vincenzi at Bologna is also drawn here to a corresponding scale with key-plans in all cases and showing the enriched parts in a workmanlike and artistic style, admirably suited for the use of an architect and skilfully enlivened with shadows and washes reproduced by a permanent photo process. The Palazzo Tacconi, with the pedimented range of windows to the main story, should also be mentioned, as well as the Palazzo Malvasia not far off. Others are given from Imola, Forli, Ferrara, and the splendid work at the Palazzo dei Tribunali at Piacenza. The Certosa, near Pavia, of course supplies Prof. Strack with some grand and rich details, from the terracotta cloisters, which he shows by good photographic reproductions, and the plates which follow these are devoted to earlier work from Brescia and Cremona, such as the Palace of the Jurist Consults, now used as a school. From the latter city, we give a view representing the red-brick Campanile, or Torazzo, which has obtained for Cremona its architectural celebrity. It was begun in 1283 at the cost of the Guelphs, the partisans of the Pope, in celebration of the treaty of peace made between Cremona, Milan, Piacenza, and Brescia in that year. It is the highest tower in the north of Italy, measuring 396ft. high, and 498 steps lead to the summit, from whence fine views are obtained of the Milanese district, intersected by the Po. The bells were hung in this tower in 1518, at which time the octagonal cupola was added. The cathedral has much fine moulded brickwork in its grand transept fronts, and the interior is one mass of colouring and gilding. The Battisterio is in a simple Lombardic style, entirely of brick, and in the centre is a noble font hewn out of a solid block of marble. The tower is connected with the Duomo by a line of loggie.

Of the vast and particularly-fine brick structure, of which a detail photograph is herewith presented to our readers—viz., the Ospedale Maggiore, or Great Hospital of Milan—we have the following historical notes, which may be of interest in this place. Francesco Sforza and his duchess, Bianca, founded the institution in 1456, giving for its site an old palace once the property of Bernabo Visconti. The new building thus inaugurated was begun in 1457, the founder and his wife laying the first stone. They gave the commission to a Florentine architect named Antonio Filarte, and the southern part of the hospital was carried out from his designs. The centre of the building, erected in 1621, was from the plans of the architects Fabio Mangone and F. Richini. No less than nine courts are comprised within the confines of the institution, and the principal one is very extensive, and surrounded by double arcades of 21 bays. The ground plan is a perfect square, the central space being occupied by the grand quadrangle, which measures 215ft. by 239ft., beyond which dimensions are the colonnades, each 18ft. 6in. wide. The grand detail of the windows, elaborated as they are in moulded brickwork and modelled terracotta round their openings, with figures of boys and foliage, can be seen in the illustration. The niches contain busts of allegorical figures and saints, while the great frieze over the ground-floor arcade is exquisitely enriched with cherubs' heads and eagles, designed in a thoroughly Milanese style. The north wing, by Castelli, does not harmonise with the main building. It was erected early in the present century. The hospital is richly endowed, and has accommodation for 2,000 beds, some 20,000 patients being admitted annually. Among the other plates yet to be named in the book under review, we have to mention some good photographs of churches: Santa Michele, Cremona, and San Marco at Milan; Santa Maria in Strada, at Monza (a building famous for its ornate terracotta work and intricate rose window in the centre; its tower has of late years been completed, and the façade restored), and Santa Gottardo, Milan, with its graceful campanile, not far from the Cathedral there. The Cistercian Monastery, known as the Abbey of Chiaravalle, has also a remarkable octagonal belfry in the Lombardic style. The remainder of the monastic buildings are excessively plain, all the ornament being concentrated in this central tower. Some highly useful details are to be seen in the Renaissance work of the church of Santa Maria delle Grazie at Milan, in the Borgo delle Grazie, which leads to the Palazzo Vercellina. It was built on the site of a barrack, and a considerable part of the military buildings were converted into the Dominican convent adjoining; but the church was built afterwards, the first stone being laid in 1464. The Gothic church of Santa Lorenzo, Vicenza, figures in

Section on A.B.

Plate 46 in a capital drawing, with the figure sculpture put in nicely. The front is divided by seven pointed arches, and in the centre is a grand porch with canopied tombs on either side between the arcade piers and projecting from the walls. Plate 48 is devoted to the chapel of Santa Pietro Martire, Verona, with the tomb of Guglielmo da Castelbarco (1320) over the side entrance facing the square. The concluding plates are occupied with details, one being taken up by the marble and brick church of Santa Francesco at Brescia. The letterpress at the commencement of the volume is interspersed with marginal woodcuts and explanatory details, which are in their way most useful. We can recommend the work to our readers. It is well printed and nicely produced, as might be expected from the hands of Herr von Wasmuth.

CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—XIII.

By Banister Fletcher, Jun., A.R.I.B.A.

THE FIFTEEN-METRE CONNECTING GALLERY.

It will be seen that this gallery (see No. 31) runs across the axis of the Champ de Mars, and connects the main body of the "Palais des Expositions Diverses" with the wings at the junction of this vestibule with the Restaurant Courts, and the extremities are crowned with domes, described below. No. 42 is a sheet of drawings from *Le Génie Civil*, giving details of the columns supporting this roof and of the roof isself. Columns of three different types had to be used—these are marked A_1 A_2, and F—in the plan above, and were necessitated by the roofs on one side of the gallery running perpendicular to the gallery; while the roofs on the other side are parallel.

Details of these columns are also given.

Each gallery consists of eight trusses, bound together, as it were, with seven purlins; one at the ridge, and three at each side. These trusses are distant from each other 8·33m, or 27·32ft., and rest on the iron standards bound together with light iron trellis beams at the top.

The semicircular principal is formed of two U-irons, riveted back to back (8·63in. by 3·15in. by ·39in.) To this principal rafter is secured a tie-rod, about ⅞in. diam., which is held up in the centre by a light king-rod. Upon this circular principal rest the straight inclined rafters, composed of light angle-irons, and braced with bar-irons. There are seven purlins, the lower ones being at the level of the gutter, which is formed by the back of the vertical side of the principal being taken up. The light is from the upper part of the roof by a lantern, as shown. The intermediate rafters are spaced about 4ft. apart.

THE CONNECTING PAVILIONS

Occur at four points along this vestibule:—(1) At the points where the vestibule abuts on the Avenue de la Bourdonnais and the Avenue de Suffren; these pavilions are 15 mètres or 49ft. 2in. square. (2) And at the junction of this vestibule with the Restaurant Court, as shown in the plate, from *Le Génie Civil*, No. 43; these pavilions are not square, but are 50ft. by 49ft. 2in. on plan.

Each of these pavilions is carried on four lattice standards about 3ft. 3in. square, which supports the roof. At the upper part these standards are bound together by a trellis beam resting on a framework of iron with filling in, which separates the pavilion from the gallery. This framework of iron consists of uprights of double T-iron, to which the purlins of the gallery are fixed, and which are supported themselves by the circular principals. The iron lattice-work semicircular arches are not of the same height on any side, but are varied for the junction of the different roofs. The standards of these arches are united at 26ft. from the ground by a cross-beam of plate and angle-irons. On this beam rests the lower part of the double T-uprights, and the filling-in is by flat bricks placed between the uprights.

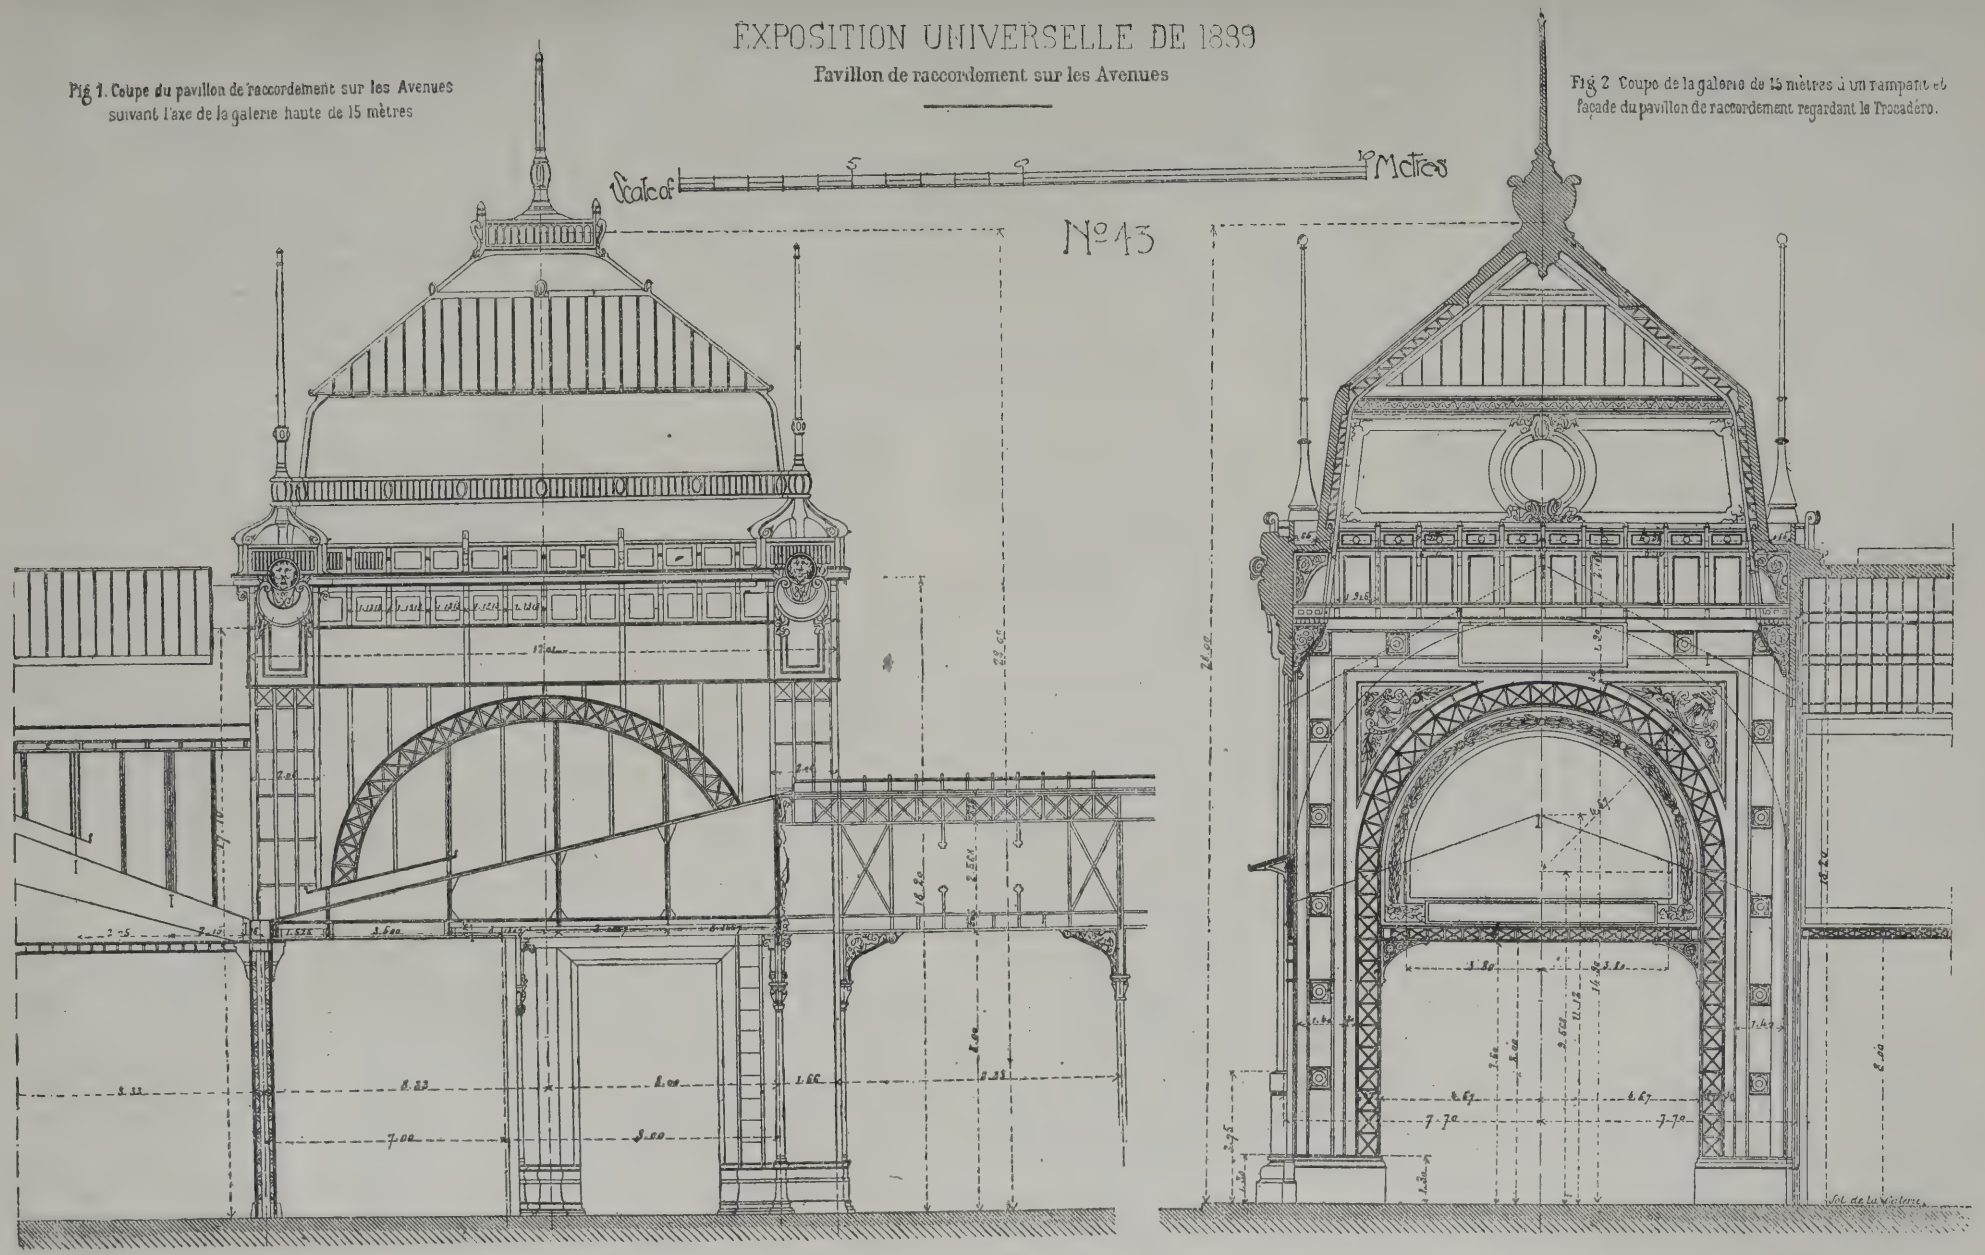
The decoration calls for no special remark, it is in "staff" and faïence decoration. The outer pavilion joining on the avenues are more richly decorated than the interior ones.

The undersides of the cupo'as in their interior are arranged with a pendentive and moulded panels in "staff," &c. The four piers supporting the domes are carried up as it were above the roof, and are ornamented with motifs in pottery and faïence.

The two internal domes are occupied by the Dutch Colonies and Switzerland, and are decorated by the "exposants" themselves, and consist not only of painted panels, but tapestry and carpets, &c. These inner partitions lead into the Restaurant Courts joining on the central garden, the roof to which (see No. 43, from *Le Génie Civil*) rests on a triangular-shaped girder, with the deepest end facing the garden, and resting on cast-iron ornamented columns. The framing in between these triangular girders, which are 7ft. deep on the garden side, is filled in with heavily-enriched "staff" decoration, glazed and painted with very rich colouring, with name spaces left in the centre, on which are printed the names of the principal towns in the world; this frieze extends round the three sides of the central garden, right up to the Galleries Rapp and Desaix. The distance between the columns supporting these triangular girders is 27ft. 4in., and the roof at the inner end is supported on girders framed in between the columns of the Palais des Expositions Diverses, between which, in order to isolate them one from the other (the Restaurant Courts from the Palais), there is filling in of brickwork. The exterior galleries of the Palais des Expositions Diverses, and which run into the connecting pavilions, have a span of 49ft. 2in., and a section is given in No. 44 from *Engineering*.

CHIPS.

The dissolution of partnership is announced of A. C. Morgan and C. J. C. Pawley, under the style of A. Morgan and Co., Prince's Mansions, Victoria-street, Westminster, land and estate agents and surveyors.



A new cemetery was opened at Earl's Barton last week. It consists of 10 acres of ground, and the mortuary, board-room, and caretaker's lodge, together with gates and piers, have been built and the grounds laid out, at a cost of £1,200, by Mr. G. Henson, of Wellingborough, from designs and plans by Mr. E. Sharman, of the latter town.

Mr. John Gallimore, builder and contractor of Newcastle-under-Lyme, and an ex-mayor of that borough, has been appointed on the Commission of the Peace for that town.

The peal of patent tubular bells which has done duty in the tower of St. Giles' Cathedral, Edinburgh, during the past twelve months, has just been replaced by another and more powerful set of the same description. The peal consists of thirteen bells—three of them being half-tones—in the key of C. It has been supplied by Messrs. Harrington at Latham, Coventry.

The ceremony of blessing the bells of St. Richard's new Roman Catholic chapel, Atherston, took place at the Church of the Sacred Heart, Huidsford, on Sunday. The chapel will accommodate 200 persons, and may be afterwards enlarged to hold 470. Messrs. Sinnott, Sinnott, and Powell, of Liverpool, are the architects, and Messrs. Brown and Son, of Salford, the contractors.

At the last meeting of the Skipton Rural Sanitary Authority, the contract for the sewerage of Carleton, from plans prepared by their surveyor, Mr. C. C. Smith, was let to Mr. Benjamin Kirk, of Skipton.

THE LEWISHAM GRAMMAR SCHOOL FOR GIRLS.

THIS school is being erected for the Governors thereof under a scheme prepared by the Charity Commissioners for the administration of certain local bequests, and the accommodation provided is for 300 day scholars. The school is built on the central hall system, the class-rooms opening into same on the ground floor. The size of the assembly hall is 60ft. by 30ft. by 27ft. high, and at the first-floor level is a gallery with accommodation for 80. This hall is well lighted with windows at end and sides, that at end being filled with a large three-light subject representing the Arts and Sciences. The other accommodation, briefly, is as follows: Board-room, fitted with museum and bookcases, 30ft. by 28ft.; dining-room, 27ft. 6in. by 17ft. 6in.; ante-room to the assembly hall, 25ft. by 12ft. 6in.; head mistress's room, 19ft. 6in. square, and three large class-rooms, and a very large cloak-room and lavatory partitioned off for each class for boot lockers, cloak stands, &c. All the above-mentioned rooms are on the ground floor. On the first floor are three large class-rooms, a drawing class-room, 21ft. square; a needlework-room 28ft. by 20ft. 6in.; a laboratory, 25ft. 6in. by 20ft. 6in., both fitted with fume-closets; and the necessary apparatus for teaching physiology, chemistry, &c.; assistant-mistresses' room, 22ft. 6in. by 20ft. 6in.; and a kitchen, 28ft. by 18ft., to be used for cookery lessons. Both floors are fitted with lavatories, &c., the sanitary fittings being of the most modern type. Externally the building is of red bricks and stone dressings, and slated with green slates, and is located at the corner of Hawstead-road and Rushey-green. The builder is Mr. S. J. Jerrard, of Lewisham. The building is surrounded by a large playground, with a covered play-shed for wet weather, and at the back high boundary walls, while in front are dwarf red-brick and stone boundary walls surmounted by a wrought-iron railing. The work has been done from the drawings and under the superintendence of Mr. Albert L. Guy, A.R.I.B.A., 78, High-street, Lewisham.

BANNER FOR ST. AGATHA'S CHURCH, LANDPORT.

THIS banner was the gift of the Rev. R. R. Dolling, of Winchester College Mission, Landport. It was embroidered in gold thread and various coloured silks by Miss C. B. Wright, of Alverstoke, Gosport, and designed by Mr. Oswald Fleuss, of Hammersmith, W.

NEW BANKING PREMISES FOR THE YORK UNION BANKING COMPANY, LIMITED, HULL.

THE York Union Banking Company are commencing the erection of new premises upon a site at the corner of Lowgate and Bowlalley-lane, in the town of Hull, and immediately opposite the Merchants' Exchange. The ground-floor of the building will be used for the purposes of the bank, and the upper floors will contain suites of offices, approached by a separate entrance. The exterior will be in the Flemish Renaissance style, executed in Ancaster stone, with granite for the basement. The works are from the designs of Messrs. Smith and Brodrick, of Hull, architects, which were selected in a limited competition.

OLDHAM SCHOOL BOARD OFFICES—SELECTED DESIGN.

THIS double-page plate represents the selected design in the late competition for the School Board offices, Oldham, of which Mr. Francis E. L. Harris, A.R.I.B.A., is the architect. The general arrangement of the various rooms is in accordance with the official instructions. All the departments have a direct light, and the board-room is disconnected from the main building. An ample entrance-hall and good staircases are features in the plan. The public hall accommodates 450 persons. The materials throughout are red bricks and freestone dressings. The main roofs are of light wrought ironwork covered with Westmoreland green slates. The staircases and floors are of light breeze concrete on wrought-iron joists. The high-pressure system of hot water is to be used for warming. The architectural design is of inexpensive character, well suited for a simply-treated building. The cubical contents are 297,032c.ft.

THE BAPTISTERIUM AND DOMTHURM, CREMONA, AND OSPEDALE MAGGIORE, MILAN.

(SEE description on p. 352.)

PETERSGATE, YORK, AND ENTRANCE TO THE NORTH TRANSEPT OF ROUEN CATHEDRAL.

THESE two sketches, by Mr. F. P. Barraud, were exhibited some little time since in King-street, St. James's, at Mr. Mendoza's galleries. The first named of the views shows Low Petersgate, the western towers of York Minster crowning the picture. The timber and plastered house to the left of the sketch was the home, during the middle of the last century, of Henry Hindley, the celebrated clockmaker, and great friend of the illustrious engineer, Smeaton. Gent, too, the printer, lived in this street, and died there in 1778. The other study represents the gateway leading to the north portals of Rouen Cathedral.

SKETCHES WITH THE SOCIETY OF ARCHITECTS IN KENT.

WE are indebted to Mr. J. W. Twist, of South Shields, for the sheet of well-executed sketches of some of the architectural objects of interest visited by the Society of Architects during their recent enjoyable and most successful excursion in Kent. Most of the sketches were referred to in our report last week and the week before, and the others are self-explanatory. A series of the same district were given in our issues of August 6, 13, and 20, 1886, on the occasion of the visit of the Architectural Association to Mid-Kent.

A memorial cross, designed by Mr. Kitchin, son of the present Dean of Winchester, is about to be placed over the grave of Dean Bramston at Winchester.

An organ has been placed in the Chapel of the Incarnation in St. Nicholas's Cathedral Church, Newcastle, at the cost of an anonymous donor, and was opened on Friday. It has been built by Mr. F. E. Nicholson, of Newcastle, and is inclosed in an oak case designed by the architect to the Dean and Chapter, Mr. R. J. Johnson, and executed by Mr. Ralph Hedley, the carver of the new oak work in the choir.

A new altar has been erected in St. Mary's Roman Catholic Church, Saltcoats, N.B. The new altar is of marble and Caen stone, and is from a plan by Messrs. Pugin and Pugin, and executed by Mr. R. J. Bolton, of Cheltenham. The height is about 30ft. The upper panels on each side of the altar represent a group of angels adoring the Blessed Sacrament. The cover panels and the super-altars are of Palermo marble. The throne is of Caen stone, resting upon marble pillars. The tabernacle, of iron, has a brass door, in which there is a floral design, the handiwork of Messrs. Hardman and Co., of Birmingham. The altar is one slab of stone, resting upon four marble pillars. The painting within the sanctuary is symbolic of Our Lady Mary, Star of the Sea. Beyond the altar is a small oriel window which has been filled with stained glass, also the work of Messrs. Hardman and Co. The railings, pulpit, and other internal fittings of the church have been renovated. The church was re-opened on Sunday.

COMPETITIONS.

"OWEN JONES" PRIZES.—The six prizes for the present year, given on the results of the annual competition of the Science and Art Department, have just been awarded. Each prize consists of a bound copy of Owen Jones's "Principles of Design," and a bronze medal. The following are the successful candidates:—

William E. Holt, School of Art, Burnley.—Design for a printed cotton hanging. Archibald Walker, School of Art, Glasgow.—Design for carpets. Lindsay Butterfield, School of Art, South Kensington.—Designs for printed tiles. Mary Mohun, School of Art, Canterbury.—Design for damask; design for tiles. William H. Cantrill, School of Art, Cavendish-street, Manchester.—Designs for the decoration of a staircase and proscenium of Manchester School of Art. Emma Hodgkinson, School of Art, Cavendish-street, Manchester.—Design for carpet.

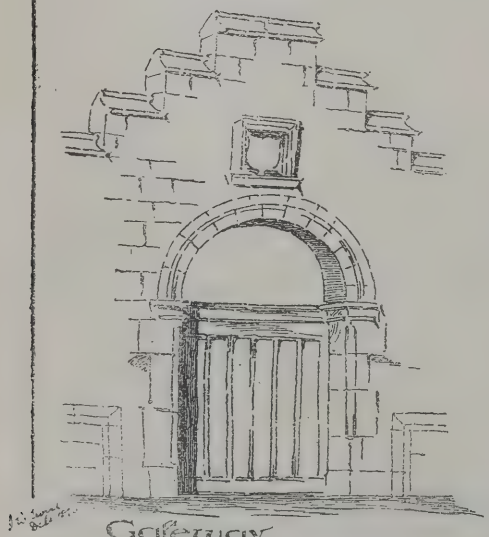
THE TAITE WELSH INTERMEDIATE SCHOOL COMPETITION.—The award in this competition was made known last week, and in the assessor's (Mr. Ewan Christian) report the names of the successful competitors were placed in the following order:—Messrs. Phillips and Holdgate, Cardiff and Newport; Messrs. Baker and Hughes, London; Mr. T. E. Pryce, London; and Mr. R. Grierson, Bangor. It is intended to publish the assessor's report.

YORK.—The Municipal Offices Committee of the York Corporation have had before them designs from two London firms for furnishing the Council Chamber in the Municipal Buildings in course of construction. The designs were, it seems, considered too expensive, and it was decided to offer a premium of £20 for the best design, the cost not to exceed £600. The competition is open.

ARCHÆOLOGICAL.

CASTLE CARY.—The excavators have been hard at work at Cary Castle, Somersetshire, and now the foundations of the keep are sufficiently exposed to enable an accurate ground plan to be made. This plan reveals a state of things that was totally unexpected by archæologists. In the first place, it shows beyond doubt that the castle was not in the position where it was generally supposed to stand, and where its site had been marked on the latest Ordnance map, but about 200 yards to the south-west of it; and it shows that the castle was not an ordinary "shell keep," as described by G. T. Clark, but a strongly-built fortress of unusually large dimensions and thickness of walls. The outer wall is 15ft. in thickness, the foundations being of Cary Hill stone and the facings of Doulting and Ham Hill. The longest dimensions of the keep are 89ft. by 78ft. The worked or faced stones that have been discovered bear the marks of the axe. In the course of excavation a large quantity of bones of animals and pottery has been turned out, but as the digging has hitherto been confined to the walls and foundations, the "finds" in this way are not so miscellaneous as may be expected from an examination of the floors of the building and the well. The latter feature has not yet been found. There are also an iron arrow-head or two, and two blades of knives, a sling stone, and some flints belonging to the Early British times. Accurate plans and sections are being prepared for the purpose of preservation among the records of the Somersetshire Archæological Society at Taunton.

On Saturday afternoon, on the invitation of Mr. J. Pyke Thompson, about 70 ladies and gentlemen, members of the South Wales Art Society, and their friends, journeyed from Cardiff to Penarth, to enjoy the hospitality and inspect the recently acquired Turner drawings and the other art treasures of the proprietor of Turner House. We illustrated the gallery, which has been built from plans by Mr. Edwin Seward, R.C.A., of Cardiff, in our issue of the 22nd ult. The annual exhibition of the South Wales Art Society will be held in Cardiff in the middle of November.



It is stated that the amount actually expended and paid for by the Jezreelites in building operations at Chatham up to the time the work was suspended was £30,000. It will cost over £2,000 to roof the temple, besides which extensive internal work will be required. The statement that the builders have taken over the land and buildings in satisfaction of their claim of over £6,000 was premature. The case has to go through the Chancery Division after the Long Vacation. Experts pronounce the unfinished temple as useless for any purpose, and there would be difficulty in pulling it down owing to the massive character of the work. Over 2,000 tons of iron was used in the construction of the temple.

WAYSIDE NOTES.

SIR PAUL PINDAR'S house, so well known to London archæologists, is to be very shortly demolished. The quaint old façade in Bishopsgate-street is in danger of being destroyed. Unless somebody is forthcoming who will purchase and re-erect it in his own demense or in a public place, this curious relic of Mediæval London will utterly perish. Sir Paul Pindar's house stands on the site of the proposed extension of Liverpool-street Station, forming one of a whole block to be removed at no distant date. It is understood that any day a contract may be signed for the levelling of this block of buildings, so parties desirous of securing the old oak front, formed into quite unusual types of oriels, carved and grotesque to a vice, should not delay treating for it, and for the curious old first-floor ceiling for which the house is famed. Mr. E. A. Phipson, writing to a daily last week, suggested that its re-erection would be an ornament for one of the parks or for Epping Forest. I can imagine that an enterprising publican about to build a suburban "house" would find it a profitable speculation to invest in the façade and the ceiling, and to adapt the same to his new premises—or old ones for the matter of that. It would surely pay him, and it would be better thus to save the unique handiwork than that it should be utterly destroyed. And in being adapted to a public-house the old timbers would only be continuing in the same line of business as heretofore, feeling, perhaps, after long usage, quite at home amidst the clinking and clattering of pewter and glass.

The G.E.R. Co. have, it is believed, offered to deal generously, should anyone come forward, to preserve the work in the interest of the public—not the publican. I should think the company themselves would be able to do something in the way of preserving the valuable portion of it. It would not need a great amount of ingenuity or force of originality to work in the façade at some convenient spot along the line, where it could be seen by passers-by. The façade and ceiling could—if in sufficient preservation—be adapted to some new cottage or house at a country station. The probability is that the oak timbers are sound enough, and would stand a certain amount of refixing. Certainly the appearance of the work on the front would be enhanced to a vast extent by clearing off the paint that appears thickly overlaid. I recommend this idea for the preservation of the front and ceiling to the company, who could thus take the matter in hand themselves. The architectural department at Liverpool-street are surely equal to the task of adapting it somewhere as suggested.

The quarry-dressed stone system seems to be extending. The employment of ready-dressed stone upon works was, in part, the cause of the seven weeks strike of masons at Plymouth, which, by the way, has resulted in the contractors undertaking to abolish piecework, the men foregoing the demand with regard to ready-dressed stones. I am sorry if the practice of using quarry-worked stones is increasing, as it is inconsistent with good and true architecture. With a little study, I verily believe I could detect the job executed with stones worked hard by in the mason's yard, from that where every moulding and face had been wrought at the quarry a hundred or more miles away. I can sympathise with the Plymouth masons, although, of course, a contractor has free right to do as he pleases in the matter, unless bound down by his agreement, general conditions, or specification. Such a binding down I would recommend all those thinking as I do in this matter of quarry v. home labour to include in some part of the documents relating to a contract. In days gone by this was unnecessary; now, owing to the encroachment of the system of working architecturally at quarries, and the advantage in price offered, in certain cases, to contractors, the architect must protect his client and his reputation. It may be that I have taken an unmerited dislike to the system of quarry-worked stones; anyhow, I look upon it as in every way objectionable, leading to unsound construction, annoying delays, bad jointing and misfitting, and unsympathetic, unartistic masonry. The quarryman has his business: to quarry building stone from the bowels of the earth. The mason has *his* business: to dress and prepare, to mould, face, and carve the crude stones. The quarryman must work where the stone is to be found, and the mason must work at the building for which the stone is employed, so that he may be continually beneath the eye of the architect, or his representative, the clerk of works. In some circumstances, as, for example, building in London on a very limited site, this may be impossible; but wherever the area is sufficiently large, there should be established the masons' yard, the sounds of the saw and the boaster mingling with the ring of the bricklayer's trowel.

So far, the British Association talk has been rather "off" architecture, even archæology having been less patronised than usual. Possibly this has something to do with the fact that this year's centre, Leeds, being a manufacturing, commercial, work-a-day place, architecture and topics connected therewith are not apropos. Electricity has been the only wear, having received much attention at the hands of lecturers. After all, we do not look for architectural subjects at the meetings of the British Association, concerned with science. When the National Art Association holds its next meeting, we may have something more in our line.

When the Englishman locates himself in a "flat" he usually feels, in the higher stories, that, thus elevated above the level of sewers and drains, he is secure from many of the ills attendant upon disorganised sanitary arrangement. Doubtless, too, he often considers he is relieved from a great burden in having no subterranean drains for whose condition he is responsible. To many persons who have been bitten in taking houses the sanitary arrangements of which have been made under the superintendance of the demoralised speculative builder, the "flat" must appear to be a refuge from all further trouble in this direction. "A Sufferer," writing to the *Standard*, tells a different tale. Having on the recommendation of a young architect taken a flat in the West-end, on a three years' lease, his family are attacked with typhoid fever in less than three months, and a second case after an interval of six months. After some superficial reforms by landlords, on complaints from "A Sufferer," palpable defects and nuisance grow worse, and in spite of frequent applications to these gentlemen, nothing is done, nor are the letters so much as answered. The unfortunate tenant is now applying to the local sanitary authorities, and from his place of purgatory warns intending flat-takers not to be deceived by advertisements as to the "latest sanitary improvements," but to be more careful at the outset to obtain competent advice. The "Young Architect," one may imagine, from the tenor of "A Sufferer's" letter, has had a warm time of it, and won't get any more sanitary jobs in that direction. He may regret that dust-shoots don't generally go with clean bills of health, but may easily become the most abominable of nuisances; and as the dust-shoot was apparently the least offensive in this instance, one can hardly imagine what this "Young Architect" was about. His education, I fear, was sadly neglected.

As to what "A Sufferer" says in warning to intending flat-takers, I would second every word, and sympathise with him in his misfortune. People have been in a great hurry to run into flats. They have to learn yet that by so doing they lose the benefit of paddling one's own canoe, or living in one's very own house. The fashion, or craze, may not yet have reached its height; but some day there will certainly be a revulsion of feeling, and flat-holders will go house-hunting, and with the desertion of whole blocks the rents of flats will come down with a run. Such, at least, appears to me the probable course of events in the future. There may be some great attraction in living horizontally, so to speak, that will insure the landlords their rent; never having gone further than visiting people in flats, I cannot speak as to the comforts, enhanced or otherwise, of this method of living. All I can see is that there has been for some years a fashion, rage, or craze, and that such fashions, rages, and crazes are almost invariably followed, sooner or later, by a revolution of feeling in favour, generally, of something diametrically opposite in nature.

Reading about the ceremony of laying the foundation stone of the new St. Cuthbert's College, Worksop — a building designed by Messrs. Carpenter and Ingelow, and estimated to cost between £30,000 and £40,000—I am led to reflect what a curious collection of things the friends of the New Zealander, who is to sit on the ruins of London Bridge, will find under the foundation-stones of the buildings—then, I suppose, equally ruined—throughout England! Coins in plenty—gold, silver, and bronze, Jubilee and common; a garland; books, newspapers, Metropolitan and local; parchment scrolls, plain or emblazoned and illuminated, and what not besides! A veritable museum is sometimes placed under the foundation-stones of more extensive buildings, and from the care and trouble taken to insure a representative and date-telling discovery to the discoverers, one would imagine that the destiny of man depended upon the coins, parchments, and other parcels of goods deposited beneath the massy stones. Whereas every purpose of date-telling would be accomplished by empyting the contents of the first schoolboy's pocket into the cavity or receptacle, so long as he had a farthing to give the year of grace and our gracious Sovereign-Lady's name. The miscellaneous items—slate-pencil ends, trouser buttons, jack-knife, "penny dreadful," &c., would further give some idea of our advanced nineteenth-century civilisation.

GOTH.

ARCHITECTURAL ADVERTISING GRATIS IN AMERICA.

OUR correspondent last week who inclosed an advertisement from the *Hucknall Star* of some touting satellite in the architectural firmament did well in bringing the ten-and-sixpenny dodge forward. The idea, though by no means new, is at least suggestive. In America, however, architects do go ahead, and leave the most enterprising members of the profession in this country miles behind. We have, for example, an architect's card before us bearing the name of Ira C. Saxe, architect, 521, Chicago Opera House, Chicago, Ill., which is headed, "Take me home and look me over." Then follows this poem in eight verses:—

The Home, a problem great and grand
When worked out with an honest hand;
So many toil with might and main,
But lacking tools they toil in vain.

Now does it pay with a chisel
To spade gardens, what a fizzle;
No greater failure than some make
In getting there the rout they take.

For convenience let the mater
Make the floor plans without pater,
Should he kick dust about the bills,
Honey a few domestic pills.

How's the pantry? fathers don't know,
Mothers will have them, thus and so;
Fathers just yield a point right there,
Or take your pantry ev'rywhere.

Their closets for glass and china,
Closets for trinkets for Dina,
Closets for this, closets for that,
Closets for cloaks—yes, and for hat.

In such details in the houses
Let the housewife wear the trouse's;
Even the architect should cave
If he's not ready for the grave.

Business men are *in* but little,
Good women are *out* but little;
So women should be chairmen, see—
In household matters referee.

Ladies are friends of architects—
They go to him with house projects;
They know he'll treat them just and fair,
They advertise him ev'rywhere.

Thirty-five Buildings in my own town, Woodlawn, Ill. Eighty in all built last season. Best of references. I have a great variety of plans, which will be cheerfully shown. No pains spaired. Bound to please. Loans negotiated. Charges moderate. Special rates to Real Estate Men. Suburban Work A Specialty.

These particulars are grouped in the margin round the verses. At the bottom of the card we note:—

Please to turn over.

Chicago.

Gentlemen,—The past season having been very prosperous, I thank you heartily for your very liberal patronage, and am still ready to give my skill and best endeavour to the public, as an Architect and Superintendent.

Estimates cheerfully given. Loans negotiated.

Thirty-five buildings in my own suburb, Woodlawn, and eighty in all in the City and suburbs last season. Can furnish some of your best citizens as references.

Respectfully, IRA C. SAXE.

P.S.—Terms moderate. Suburban work a specialty. Special rates for Real Estate Dealers.

Have a great variety of plans on hand at all prices, and will show them cheerfully.

Maybe we can make you happy, if we don't build for you—if you will call.

Then just remember the true and the tried,
Who stands by his colours, and on the right side,
Who dares to do right and loves to do well,
That all will hasten my merits to tell.

I. C. S.

THE BRITISH ASSOCIATION AT LEEDS.

THE sixtieth meeting of the British Association, which has been held at Leeds during the last nine days, under the presidency of Sir Frederick Abel, has not attracted so many visitors as any meetings of recent years, and the papers have not, taken as a whole, been up to the usual standard. In accordance with our usual practice we give abstracts of a few of the papers most likely to interest our readers, many of whom may care to see fuller reports in the *English Mechanic and World of Science* of last week and to-day, September 5 and 12.

THE BUCKLING OF PLATES.

In the Mathematical Section Mr. G. H. Bryan, of Cambridge, read a paper on the buckling of plates, in which he described the working out of the analogues for a plane plate of the well-known conditions of stability of a straight elastic wire under axial force. The first case considered was that of the rectangular plate, supported but not clamped round its boundary, and acted on by different uniform edge thrusts in its plane applied perpendicularly to the sides and ends. The conditions of stability are found, and the most interesting point that they lead to is the determination of the number of corrugations produced when buckling takes place. If the thrust per unit length on the sides be less than half that on the ends, the plate will buckle into a series of undulations, whose number will depend on the ratio of the length to the breadth of the plates. In the case of an infinitely long strip, the corrugations will divide the strip into rectangles which diminish in length as the lateral thrust is diminished, will become squares when there is no end thrust only, and will become closer and narrower when the lateral force changes sign and becomes a tension. This effect may be easily illustrated by wetting the middle of a sheet of thin paper, which is then stretched over two rulers. If, then, the rulers are pulled apart with increasing force, the wrinkles will become more numerous and finer. The undulatory character of the buckling is also analogous to the collapse into rings of a boiler flue. The paper also contained an account of an investigation of the stability of a circular plate clamped round the edges and acted on by uniform normal edges thrust in its plane. This kind of buckling, he explained, was well illustrated in the circular lid of a canister whose rim is in a state of tension.

THE PNEUMATIC DISTRIBUTION OF POWER.

A paper dealing with the utilisation of compressed air was read by Professor Alan Lupton, who gave the results of his experience derived from the working of the pneumatic distribution system in Birmingham. He showed how the supply of this air through a meter induced economy on the part of the consumers, and he gave numerous particulars as to the use of this air in the propelling of tram-cars, in the working of the electric light, for various domestic purposes, and in Paris for the emptying of cesspools. He showed the great advantages of a power suitable for large or small motors that could be cheaply and safely introduced in workshops, houses, and shops. In Birmingham there were three steam-engines of 1,000H P. which compressed air to a pressure of 45lb. above the atmosphere, and delivered into pipes which were laid in the streets like gas-pipes, and over four miles of these pipes were there laid. The works had only just left the hands of the contractors, but already there were forty customers for air power, some of them at a distance of $1\frac{3}{4}$ mile from the compressing station. The loss of power by friction in the pipes was so slight that no ordinary gauge would show it—practically, there was no loss of power due to this distance. The engines of the consumers varied in size from $\frac{1}{2}$H.P. up to 50H.P. At one works they were now using about 100H.P., which drove four or five engines, also the blacksmiths' fires, the blast of the cupolas for iron smelting, and it was also used for several novel processes, economising labour and material, that had been discovered since the power was laid on. Some difficulty had been found in getting a good meter that was correct within 1 per cent. There was now a demand for the power which gave satisfaction to those who had tried it. Some people had actually moved into the district for the sake of the convenience of having power without having to erect a boiler and chimney. Comparing the mechanical results with the prophecies that were uttered in 1886, he mentioned that then it was alleged by some that the engines as designed could not be erected, but they had been now safely set to work. It had also been asserted by some that the loss of power in compressing was such that 25 to 30 per cent. was the maximum proportion of the original steam-power that could be used by the consumer's engines. The results, however, had entirely confirmed the statements of the engineers, Messrs. Sturgeon and H. Robinson. At one works visited by him (Professor A. Lupton) the indicated horse-power of the consumer's engine was equal to 73 per cent. of the indicated horse-power of the steam engines at the compressing station—a result he considered very satisfactory. This result was partly due to the re-heating of the air in a stove, where the sweepings of the workshop were consumed without cost. In consequence, he said, of these satisfactory mechanical results the Air Compressing Company were about to extend their works. Compressed air could be used for working tramways under the patents of Hughes and Lancaster. Under this system a pipe was laid in the streets for the supply of compressed air to the cars, which cars carry the machinery for propulsion, and can ascend any gradient that a locomotive can mount, and take in fresh supplies of compressed air at every stopping place, an operation which can be effected without actually stopping the car. An experimental car on this principle had been run on the Chester Tramway.

SLUICES IN CONNECTION WITH IRRIGATION.

Mr. F. G. M. Stoney contributed a paper on this subject, in which, speaking from his Indian experience, he described the various kinds of sluices which had been employed for this purpose. The most successful of them for almost any situation was that constructed on free rollers. These sluices were now made to any required size, and were easily workable, and the wear and tear was hardly noticeable. These sluices could be usefully applied to the increasing of water-power without increased risk of flooding the country.

Mr. J. F. Golding, of Chicago, U.S.A., explained

A NEW PROCESS OF MANUFACTURING WIRE NETTING.

He stated that expanded metal was an article so dissimilar to other manufactures of metals as to require an arbitrary name, and the one he had given to it was meagrely suggestive of the process involved in its production, and not of its qualities or appearance, as these were only understood by the fullest description, or by ocular or physical demonstrations and tests, but the name, suggesting the expansion of metal, did serve to draw attention to the fact that thereby some new product of metals had been made. Briefly stated, the process of making expanded metal was the employment of a machine which so operated on a sheet or strip of metal as to slash it at intervals in parallel lines, so as to leave uncut spaces, which served to maintain the connection between all the strands produced by the act of slashing. The method by which this slashing, as well as the opening up of the sheet or strip into meshes, was performed was peculiar, and one which made it possible to transform the sheet or strip of metal into a finished article at one operation; and to this achievement was due, he thought, the great value of the invention.

CABLE TRAMWAYS IN AMERICA.

Mr. W. Newby Colam, in a paper on this subject, referred to the various means of utilising electricity, air, steam, gas, and ammonia for street traction, and the author considered that only two of them had been working a sufficient time to afford a commercial test which would survive. These were the cable and steam locomotives. Of the electrical motors undergoing commercial trials abroad, the storage system was the only one likely to be seriously entertained in this country for street purposes. He hoped that the day was not far distant when it could be proved that this means of applying electrical locomotion in streets could be worked at a fair remuneration over the average roads, because he considered it would then have a big field of operation. Electrical engineers had, however, many difficulties to surmount before this class of motor could face the varied work of ordinary streets and pay well in this country. Steam-engines were not likely to receive much attention in the future for the purpose of traction through streets, but would be found useful as a means of connecting districts. Under the circumstances he suggested that the cable might be found the mechanical power to supersede horses in cases where horses were clearly not capable of meeting the new conditions of travel. Success had attended almost every inauguration in America and elsewhere, notwithstanding quite unnecessarily large capital outlays. There are at present 501 miles of cable tramways at work, which carried last year in the States nearly eight hundred millions of people, or nearly double the passengers carried in Great Britain and Ireland. Abroad dividends of 74 per cent. had been earned, and in England they were now being worked at 47 per cent. of the gross receipts. Mr. Colam gave his opinions as to the requirements to be observed in designing cable tramways in order that they might meet with the approval of local authorities and insure economical results. He described two lines he had made in Edinburgh, and he ventured on a prediction that the low constructural and equipment cost of such a system would not fail to attract the attention and demand the consideration of tramway authorities. The author also spoke of the remarkable success which had attended the working of cable tramways in Chicago and also in the Brooklyn district of New York.

THE LINEFF SYSTEM OF ELECTRICAL TRACTION.

Mr. Gisbert Kapp, in a paper on this subject, explained that the great difficulty was to connect the car with the source of the electric current. This has in some measure been accomplished by the use of accumulators carried by the car, and in other systems by the use of overhead wires—which in practice effect the object with very little loss of electromotive force. But when town councils began to object to overhead wires, some form of communicating the force from below became necessary. Various arrangements have been tried. In some cases a slot was used, as at Blackpool. This system is, as experience shows, practically workable, though the slot is a disadvantage, and its abolition is highly desirable. How to abolish the slot and yet retain electrical connection between the underground conductor and the motor on the car was the problem which the inventor set himself to solve. In his system the conductor consists of a bare copper strip or cable, and of a galvanised iron strip. The latter lies on the copper conductor, and both are inclosed in a sealed channel formed of asphalte. The copper conductor rests upon the bottom of a trough of glazed tiles, and the cover to this trough is formed by the lower flanges of iron rails arranged in short sections so as to be insulated from each other. The surface rail, which may be arranged alongside one of the ordinary tram rails, or in the centre of the track, is in electric and magnetic contact with an electro magnet carried under the car. This magnet runs upon the surface rail on wheels, which form its north and south poles. The distance of the wheels is greater than the length of a section of insulated rail, so that successive sections become oppositely magnetised. This causes the iron strip immediately below the magnetised region to be attracted upwards and thus come into contact for a length of several feet with the under side of the two sectional rails. At the same time the iron strip to both sides of this region remains in contact with the copper conductor, and forms thus an electrical connecting link between the copper conductor and a few sections of insulated rail under the car. The current passes from the surface rail through the body of the electro-magnet into the motor, and finally into the ordinary tram rails and earth in the usual manner. The electro-magnet is energised by a shunt current obtained from the main conductor; but to provide for the possibility of dropping the strip, there is placed on the electro-magnet a third thick wire coil, which can be energised by two storage cells carried on the car, and thus the strip can be picked up and the main circuit again established if it should have been accidentally interrupted. It follows that only a short length of the tram rail, never more than 9ft. at once, becomes the conductor of the current to the motor on the car. The system has been estimated to cost £2,000 per mile if adapted to ordinary tram lines; and the mechanical strength of the line has been tested by running a steam roller over it in various directions, under which treatment the line suffered no damage whatever.

DEFECTS IN THE ORDNANCE SURVEY.

Mr. Henry T. Crook read a paper on "The Present Stage of the Ordnance Survey and the

Paramount Necessity for a Thorough Revision." He said that it was strange that, when the need for accurate maps was daily increasing, there should be a falling off in the sale of the national maps, for the making of which the nation had paid an enormous sum. This was mainly attributable to the fact that the maps did not meet popular requirements. The Ordnance Survey Department had undertaken more than it had the means to carry out in any reasonable time, and after more than a century's existence the department had not completed one of its works. It had not yet produced on any scale a uniform map of the British Isles. Besides other disadvantages the important question of price affected the sale of the Ordnance maps. The establishment of a revision department was absolutely necessary, which could only be done by increasing the proportion of the annual grants devoted to revision.

NON-POROUS WALLS.

THE prevention of the saturation of ordinary brick walls is one of the many problems in modern buildings. Architects, with true conservative instincts, still cling to the solid brick walls, though sanitarians and hygienic builders have been preaching a crusade against them for many a year; and they still believe in solid walls, although it has been shown how easily all the beauty of solid moulded jambs and reveals can be produced in walls constructed with a cavity, and that the hollow wall has quite as much strength, if properly bonded by ties, as the solid wall, and can carry all the weight that is ever likely to be brought upon it. The preference for solid walls lies in the sentiment of the thing; the glory of ancient architecture has, in the popular mind, been associated with solidity and massiveness, and the thick stone wall, such as we see in the Tower of London, and in hundreds of our English castles and fortresses, has become a thing in the imagination that cannot be eradicated by any amount of scientific theory. The Englishman puts his faith in thick walls as symbolical of impregnable England. The Americans, and our colonists, who live in or have visited countries where timber abounds, are ready to assert the merits of wooden houses and log cabins, though they must have a liking for the old English wall of stone or brick. Their houses and villas have a *thin*, tawdry look about them; the reveals to windows look meagre; there is a lack of projection and shadow, which are such valuable features of English indigenous architecture. Even the half-timbered houses of the States cannot compare for picturesque qualities with those erected in England, where the original types of half-timber building are to be found. The timbers have a "skin deep" appearance; but the shingle wall of the States has merits which cannot be disputed. The shingle construction there adopted and perfected combines warmth and dryness in the colder and damp climates, and those who live in frame houses half built of brick and covered with clapboarding and shingles say they combine all the advantages of both systems. One reason of this is because there is a cavity—the walls are partially hollow. But there are advantages in the material; being a non-conductor of heat, it retains the warmth. Take, for example, the dwellings of this kind found in New York, Massaschusetts, and other States. The exteriors are shingled, and stained a bright sienna or painted red, with olive-green "trimmings"; the roof is also shingled and painted red. The interiors are finished in cherry or some hard wood like oak. There is considerable comfort in these well-finished houses. Other dwellings are sheathed and papered exteriorly, perhaps the first story is clapboarded and painted colonial yellow, with bottle-green trimmings; the second story is shingled and painted red. Sometimes the clapboarding is painted a grey, with trimmings of a darker shade. Whatever are the artistic merits or otherwise of these wooden houses, they are certainly comfortable, while the ordinary brick villa is subjected to every discomfort in wet weather, owing to the porousness of the bricks that are generally used.

If hollow walls are objected to there are remedial measures. Thus, Sylvester's process of repelling moisture is an old and simple plan that might be followed by builders before houses are let. It consists of using two washes alternately for the surface of the walls, one composed of Castile soap and water, and the other of alum and water. The proportions are three pounds of soap to one gallon of water, and half a pound of alum to four gallons of water, both substances to be well dissolved before applying. The first soap wash should be laid on while boiling hot, with a flat brush, and a frothy appearance be produced. After 24 hours, when it will become dry and hard, the alum wash is to be applied warm, and should also be allowed to dry before a second coat of the soap wash is put on. These coats can be repeated till the walls are rendered impervious to water. The combination of soap and alum forms an insoluble compound which fills the pores of the brick. The reason why so many houses are uninhabitable through dampness is because the remedy is applied too late, when the bricks have become begrimed with soot. The solution should be applied to newly built walls, and in the manner we have described, thoroughly, not merely a weak solution improperly applied in about two coats. If the provision were made in the contract and specified, there would be little of the trouble afterwards experienced by the tenants.

BOOKS RECEIVED.

Geometrical Drawing for Art Students, by I. H. Morris (London: Longmans, Green, and Co.), is arranged to meet the requirements of the art student, while it also supplies the student with all the geometrical knowledge required to pass the South Kensington examinations for the second and third grade art certificates. Mr. Morris has wisely devoted attention to the application of plane geometry to architectural and decorative art, and for this purpose has given prominence to the use of scales, which not many architects' draughtsmen understand, though they may use certain scales in a sort of rule-of-thumb manner. After lines and angles, triangles, and other geometrical figures have been defined, and simple problems in them given, the work treats of proportionals or the methods of dividing lines founded on Euclid VI., according to certain numbers or proportionally to them. Making copies of maps to a certain proportion are included in this part. The problems on triangles and quadrilaterals are fully and concisely worked out, the diagrams being very clear. Problems on the circle and regular polygons are comprehensively dealt with. The chapters on scales and the use of scales are very necessary and useful, and the problems presented are of a practical character. For example, the author explains the meaning of a "representative fraction," or the ratio each line of a drawing bears to the real object, as the fraction $\frac{1}{36}$ denotes the scale of 1in. to 1yd. Here is a problem: "Draw a scale of $\frac{1}{60}$ to show yards and feet, and measuring 5yds. The scale has to be long enough to measure 5yds. long; therefore its total length will be $\frac{5}{60}$th or $\frac{1}{12}$th of 1yd.—that is, 3in. Draw two lines 3in. long. Divide and number as shown." Another: 1in. represents 13ft. 4in. Draw the corresponding scale, divided into 10ft. lengths, one length, subdivided into feet. Here the representation fraction $= \frac{1\text{in.}}{13\text{ft. }4\text{in.}} = \frac{1}{160}$. The unit is a distance of 10ft. If 160in. be represented by 1in., then 10ft. or 120in. will be represented by $\frac{120}{160} = \frac{3}{4}$in. Set off distances of $\frac{3}{4}$in. representing 10ft., and subdivide left-hand division into 10 equal parts. The principle in the construction of diagonal scales is clearly explained, and several problems for drawing scales showing inches and lengths, hundredths, &c. The problems on the use of scales show how polygons and irregular figures, such as boundaries of land, can be drawn to certain scales. Thus problems of land surveying, levelling, architectural drawing are given to show the application of scales in drawing, reducing, and enlarging. The scale of chords for measuring angles, and the sector for dividing lines and constructing polygons, are also applied. The copying of ornament, such as the Greek fret, is one of the applications of this part of the treatise. In another chapter we find examples of geometry applied to the construction of patterns and tracery; and solid geometry is comprehensively dealt with in a series of valuable problems. The exercises at the end of each chapter are valuable to the student. The book contains nearly 600 diagrams, arranged on every alternate page, and these are particularly clear, and face the letterpress to which they refer. We can cordially recommend this little book to all art students and pupils.——*Handrailing and Staircasing*, by George Collins (London: Crosby Lockwood and Son), is a new edition of a useful treatise, showing simple methods for finding the pitch of the plank, drawing the moulds, bevelling, squaring the wreath, and other technical operations of the handrailer. The methods shown are at least simple. The present volume contains a treatise on stair building, in which the practical details of ordinary staircases are dealt with, which should prove of value to the student and apprentice.——*Structural Mechanics*, by R. M. Parkinson. We omitted to mention in our notice of this useful work that the publishers of this little book are George Bell and Sons, York-street, Covent-garden; and Whittaker and Co., Paternoster-square.

CHIPS.

A new Jewish synagogue, built from the designs of Mr. Delissa Joseph, was consecrated at Hammersmith on Saturday.

A fine new music-hall, which has been constructed at Chatham from the plans of Mr. G. Friend, of Maidstone, architect, was opened on Monday evening. It holds 2,000 people, and is fitted with the electric light both inside and out.

Old Greyfriars' Church, Edinburgh, which has been closed for over a month, was reopened on Sunday. The church has been renovated, and the organ has been overhauled and enlarged by Messrs. Hamilton, George-street, the successors to Messrs. Hamilton and Müller, the original builders.

The eleventh annual exhibition of the Isle of Wight Fine Art Society, of which Princess Beatrice is president, was opened on Monday at Ryde. About 500 pictures were exhibited by artists and amateurs from all parts of the island, including a three-panel screen, painted with flowers, and a small oil-painting, "Sunset at Biarritz," both by Princess Beatrice.

A Wesleyan chapel is being built in Union-street, Carlisle, from plans by Mr. James Leslie, of London-row, in that city. It will cost £3,500, and will be 72ft. long by 44ft. wide inside, seating about 500 persons. The seats and internal fittings are of pitch pine, with wood-block flooring introduced in the passages. The main front is of red brick with stone dressings. The chief contractor is Mr. James Beaty.

The engineering department of the City of London College, conducted by Mr. Henry Adams, P.S.E., M.S.A., will be opened on Oct. 1st. The classes include technical drawing, building construction and machine construction, civil engineering, quantity surveying and land surveying. Numerous valuable scholarships and prizes are offered in connection with the classes. In the architectural competition the subject given this session is a lych gate.

A scheme is under consideration in Liverpool for building a People's Hall in that city, from designs prepared by Mr. Edmund Ware. It is intended to erect a large hall to seat 2,500 people, a smaller concert hall for 250, together with twenty committee-rooms, library, smoke-room, reading-room, and gymnasium. The estimated cost is £30,000.

At the concluding sitting of the Trade Union Congress on Saturday, a resolution was adopted in favour of the compulsory registration of plumbers.

The tower of St. Giles's Church, Cripplegate, is undergoing restoration at a cost of £300. The work is being done by Messrs. Brass and Son.

Mr. Moss Flowers has been awarded a certificate of merit for his gradient indicator at the Health Exhibition, Brighton.

King Humbert will unveil a monument to the late King Victor Emmanuel, in Florence, on Saturday week, the 20th inst. A week later his Majesty will inaugurate the first Italian Architectural Exhibition at Turin.

The deadlock which has for some time paralysed the action of the Hanley School Board has ceased. The members were equally divided as to the policy or otherwise of adopting plans by Mr. Scrivener for new schools in Glass-street; but they have now resolved, only by the chairman's casting vote however, to carry out two blocks, one side of the street being reserved for an elementary school and the other for the higher grade school. For elementary schools for 698 scholars, on the south side, the architect's estimate was £8,893, including cost of site, which was £11 13s. 9d. per scholar. The estimated cost of carrying out the plans for the higher-grade school on the north side would work out at £28 9s., including cost of site. Mr. Scrivener said the estimated cost, according to the present plans, for the elementary school was £8,893, as against £10,938 according to the original plans; but they had done away with the cookery-room, the gymnasium, and the technical school room, and the accommodation was for 690 scholars instead of 898.

Building Intelligence.

Birmingham.—The United Methodist Free Church which has been erected at Gravelly Hill, Birmingham, in memory of the late Alderman M. J. Hart, was opened on Tuesday. The church, which is a Gothic building, standing at the junction of the Lichfield and Tamworth roads, is capable of accommodating 500 people, being 72ft. in length exclusive of apsed end, and 38ft. in width exclusive of transepts. The plan is cruciform in shape. The front end of the church is utilised for entrances and lobbies, and also for a cloak-room. The choir seats are arranged round an apsidal end at the rear of the rostrum, the opening being spanned by a large arch with two smaller arches, one being used for the front of the organ and the other being occupied by a large memorial tablet. The tablet is of statuary marble, with Caen stone and rouge royal marble dressings, the upper part being filled in with cut and carved stonework, with the letters "M. J. H." as a monogram in the centre. The pulpit stands at one side of the platform, and has been carried out from the designs of the architects by Messrs. Jones and Willis, in polished pitch pine and mahogany. The vestries, three in number, are on either side of the rostrum. Over the minister's and deacons' vestries and kitchen premises is a lecture-room. The buildings, which have cost £4,000, have been erected by Mr. John Bowen, of Balsall Heath, from the designs of Messrs. Ingall and Son, architects, Birmingham.

Bishopsgate.—The Great Eastern Railway Company are now demolishing shops on the western side of Bishopsgate-street, between Liverpool-street and Worship-street, preparatory to extending their terminus on the eastern side. The company obtained the necessary powers a good while ago, the *City Press* remarks, and during the last Session they got an extension of time for carrying out the project—five years as from August last. Except Primrose and Skinner streets, the company may permanently stop up and discontinue as public thoroughfares all the intervening spaces. A large number of the working class have been, or will be, removed by the extension and improvement, and provision has had to be made for them elsewhere. Three or four blocks of artisans' dwellings have been erected by the company not far from the spot the people have been removed from. Probably shops and offices will be re-erected along the thoroughfare. A new entrance to Liverpool-street Station will be made, with booking offices, &c., in Bishopsgate-street, opposite the fire-engine station, and this should relieve the pressure of the traffic on the Liverpool-street side. The whole project will be a costly one, involving an expenditure of a million pounds or more, of which £700,000 is put down for land and from £300,000 to £400,000 for the enlargement of the station and hotel. Among the principal buildings displaced are the Bishopsgate Schools and the school chapel in Skinner-street. The new schools are being built in Spital-square. The school, together with the adjoining chapel or hall, and curates' residence, has been designed by Mr. T. Chatfeild Clarke. The style will be simple Renaissance, and the materials to be used are red brick and terracotta. Messrs. Woodward and Co., the builders, have already made considerable progress with the foundations. The heating and ventilation of the building will be carried out by Mr. W. W. Phipson. Another public building to be removed is the Great Central Temperance Hall.

Botcherby, Carlisle.—A new mission church at Botcherby was opened on Friday by the Bishop of Carlisle. In plan the building consists of a hall, 36ft. by 24ft.; semi-octagonal chancel, 12ft. by 8ft.; vestry, with lavatory, and a heating-chamber. The style is Early Gothic. The principal external feature is a brick bell-turret 35ft. high, over the entrance-porch. Local red bricks are used for the principal walls, and the roofs are covered with Welsh slates, except the roofs of porch and turret, which are covered with red tiles. The carpenter's work is of Baltic white wood, and the joiner's work of pitch pine. The walls internally and the ceilings are plastered. The roof principals, which are dressed and moulded, show below the ceiling of hall. Accommodation is provided for 173 adults. The cost, exclusive of pewing and the boundary walling, is about £500. The internal fittings, consisting of desk-table and benches in solid oak, elaborately carved, are a special gift. The whole contract was carried out by Mr. John Reed, under the supervision of the architect, Mr. H. Higginson, M.S.A., Carlisle.

Carlisle.—The biscuit-works of Messrs. Carr and Co. are being enlarged by the erection of a new factory adjoining the present buildings, and from the designs of the same architect, Mr. T. Taylor Scott, of Carlisle. The foundations are being laid by Messrs. Johnstone Brothers, of Blencowe-street, Carlisle. Since then the contracts for all works have been let as follows:—Builder's work, Messrs. Johnstone Brothers, Carlisle; fireproof construction, tanks, and all ironfounder's work, Messrs. Homan and Rodgers, of London, Manchester, and Belgium; carpenter and joiner's work, Mr. Wm. Lattimer; plumber's work, Messrs. W. and R. M. Hill; slater's work, Mr. Thos. Graham; and plasterer's work, Messrs. R. M. Ormerod and Sons, all of Carlisle. The bricks that are being used are from Birkby, which were tested by hydraulic machinery before being used for Messrs. Carr's Silloth flour mill. The external elevations of the new building will be much the same in design as the present, viz.:—red brick, with white stone dressings and slated roofs. The building consists of basement and four floors, each 97ft. by 64ft., and adjoining is a new chimney shaft 170ft. in height. The buildings will be fireproof throughout, and the new factory will be connected with the old one by a fireproof staircase and corridors, closed at the ends with iron fireproof doors. The whole of the buildings will be lighted by the electric light, this being the first building in Carlisle so lighted.

Liddington.—The parish church of St. Andrew was reopened on Friday, after being closed ten months for repairs and restoration. The chancel has been repaired by the Ecclesiastical Commissioners; Mr. Ewan Christian being the architect for this portion; and for the other work, executed by subscription, the architect was Mr. J. C. Traylen, of Stamford, the diocesan surveyor. Messrs. Roberts and Son, of Weedon, were the builders. The work of the nave and aisles has consisted of renewing the roofs in oak without departing from the old design. The floor throughout has been renewed; under the seating solid wood blocks have been laid in the herring-bone pattern; whilst in the passages the old stones have been relaid, replaced where necessary by new ones. The old grave slabs have been retained in their original positions; the ancient plastering of the walls has been cleaned; fragments of old painting have been carefully preserved, thus retaining as far as possible the ancient appearance of the church; the glaze of the windows has been re-leaded and made weather-tight; the exterior of the church has been repaired and pointed; parapets and other features have been reinstated; the screen has been cleaned and repaired, traces of the usual coloured figure decoration on the lower panels being preserved; the font has been set up on new steps and shaft, the Jacobean font cover being retained. In the chancel is a curious feature. High up on the north and south walls twelve small holes (six in each wall) have been opened out. Their use is believed to be connected with the acoustic properties of the church. The rood-loft staircase, which had been hidden behind lath and plaster, has also been opened out. The church will now accommodate 236 worshippers. The clock has been replaced by one made by Messrs. Potts, Leeds. The restoration has cost £1,900.

Newcastle-on-Tyne.—A special meeting of the Town Hall and Municipal Offices Committee of the Newcastle Corporation was held on Monday, when it was unanimously agreed that the city engineer should prepare tracings to show the street improvements deemed necessary in connection with the four sites suggested for the new town hall—namely, Fenkle-street, Eldon-square, Singleton House, and a new site that was suggested by Mr. Edward Stout, including the whole of the ground on the east side of Pilgrim-street, bordered on the north by Blackett-street, and as far back as Carliol-street, showing a new street line in continuation of Market-street to a point opposite the entrance to the Blyth and Tyne Railway Station. It was also agreed that Mr. Laws should prepare at the same time a plan showing a new street line from Grey-street to the Haymarket, skirting the proposed new town hall, should it be eventually decided by the council to erect one in Eldon-square.

Newport, Mon.—Some two years back, the School Board for Newport United District having advertised for designs for schools at Spring Gardens to accommodate 1,000 children in three departments, many of the local architects submitted plans for the same. The Board, after selecting two sets of drawings as most suiting their requirements, marked these drawings A and B, and forwarded both sets to Mr. Bruce Vaughan, architect, of Cardiff, for adjudication, who advised the acceptance of plans marked B, the author of these being Mr. E. A. Lansdowne, of Newport, and the schools have been carried out under his supervision by Mr. Wm. Price, builder, of Newport, for a sum of £6,055 16s. 7d. The fireproof flooring was executed by Messrs. Homan and Rodgers, Manchester; latrine by Messrs. Adams and Co.; lavatory ditto, Macfarlane's cast iron; and Mr. Henry Richards, of Newport, acted as clerk of works.

St. Anne's-on-the-Sea.—The convalescen- home which has been erected at St. Anne's-on-the-Sea by the two Misses Ormerod will be formally opened by the Lady Eleanor Cecily Clifton to-morrow (Saturday). The home is situated at the junction of Clifton Drive with Todmorden-road, St. Anne's-on-the-Sea. The principal entrance faces the Clifton Drive, and is approached from the Todmorden-road. It communicates directly with the departments appropriated to the use of the management, the portion devoted to the convalescents being on the sea front of the building. The accommodation comprises refectories and kitchen offices in the basement, with the day-rooms for the children, sitting-rooms and doctor's room on the ground or principal floor. The dormitories and bedrooms are arranged on the upper floors reached by two staircases, one at either end of the building. The exterior is faced with red bricks from Ruabon, the roofs being furnished with large board gables and covered with green slates. The site comprises an acre and a half. The building has been erected from the designs of Mr. Frederick Mew, architect, of Gordon-street, London. The contractors for the work have been Messrs. Shepherd, Walmsley, and Smith, of St. Anne's-on-the-Sea.

Worksop.—The Duke of Newcastle on Friday laid the foundation-stone of the new St. Cuthbert's College, Worksop. The college is to be erected on a site, over 90 acres in extent, midway between Worksop and Clumber, in the northern part of the county of Nottingham. The architects are Messrs. Carpenter and Ingelow, of Regent-street, London, and the building, when complete, is estimated to cost between £30,000 and £40,000. It will accommodate five hundred boys. At present it is intended to proceed only with the west wing and permanent offices. This will cost £15,000, and will accommodate one hundred boys.

A four-floored block of buildings, built for model lodging-houses, was opened on Friday by the Mayor of Newport, who is chairman of the company who have supplied the capital, of which just over £4,000 has already been expended. The number of beds licensed for the present building is 153. They are laid out in bunks, 26 of which are double-bedded, while the remainder are single-bedded. The premises, situate at the corner of Dock-street and Corn-street, have been erected of plain stonework, with firebrick dressings for the windows, by Mr. John Linton, contractor, from designs by Mr. E. A. Lansdowne, the total cost being about £3,000 for the shell, and £750 for fittings and furnishing.

At the last meeting of the Manchester Crematorium Company held on Friday, the chairman reported that the directors had agreed that a piece of land on the Chorlton side of the southern cemetery, in Barlow Moor-road, should be acquired from Lord Egerton. The crematorium would thus form, as it were, a continuation of the southern cemetery. The chairman had visited the Paris Crematorium at the Père la Chaise, and those at Zurich and Milan. The directors had decided upon adopting a furnace, an improvement on that constructed at Zurich, which from an engineer's standpoint, the chairman considered the most perfect. The directors had engaged Messrs. Salomons and Steinthal, of Manchester, as architects, and these gentlemen had prepared a project for the crematorium. It would consist of a hall or chapel 50ft. by 25ft., containing the furnace, with open columbaria for the reception of urns and memorial tablets. The style selected was Romanesque, and it was proposed to build the same in stone, with red-tiled roofs. The entire cost would reach £6,000.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLI., XLIX., L., LI., LIII., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

YOUTHFUL ARCHITECT. (Five per cent. on all is the right charge. If you take less, that is a matter of private agreement with your clients.)

RECEIVED.—R. M.—S. and B.—H. S. B. Co.—J. M.—T. F.—G. E. C.—S. L.—A. and Co.—B. A. H.—W. H.

Correspondence.

CANTERBURY CATHEDRAL.

To the Editor of the BUILDING NEWS.

SIR,—Allow me to correct an error in your report of the "Architects'" visit to Canterbury Cathedral.

I said the whole of the choir, presbytery, Trinity chapel (east of the choir), and corona was built between the year 1174 and 1184; not as stated in your report, between 1189 and 1199. The figures I quoted are those given by Professor Willis. You will much oblige by making the correction.—I am, &c.,

JOHN R. HALL.

The north window of Dodington church has just been filled-in with stained glass. The subject is the Wise Men presenting their offerings to the Infant Saviour. The window is by Messrs. Bell and Sons, of College Green, Bristol.

At the Stockton Corporation's last meeting a member complained that Mr. Campbell, the borough surveyor, had given Mr. T. Atterby, builder, certificates for houses in Shaftesbury-street which had walls only 4½in. instead of 9in. thick, that the same was the case with regard to a house in Lawrence-street, which Mr. Atterby had also allowed to be occupied without a certificate, and that Mr. Atterby was building houses in Bishopton-road with 4½in. walls. The mayor said all this was true, and it was a very grave offence; but the corporation were powerless. The Shaftesbury-street houses had been certificated more than six months, and therefore the authority could not interfere; and with regard to the Lawrence-street and Bishopton-road houses, the surveyor, without the knowledge of the Plans Committee of that authority, had compromised the matter and rendered the authority powerless.

Intercommunication.

QUESTIONS.

[10372.]—**Farm Buildings.**—Will any reader inform which is the best book written on this subject?—SCOT.

[10373.]—**Noiseless Pavements.**—I am anxious to ascertain, if possible, what are the best noiseless pavements suitable for the immediate vicinity of public buildings, churches, chapels, etc. I shall be glad if any of your numerous readers would give me their opinion and experience on this subject.—EDWARD VERGETTE, Town Councillor, Peterborough Corporation, Market-street, Peterborough.

[10374.]—**Stoppage of Work Let.**—In case where the several trades for the erection of a new building have been let and the works only partially proceeded with, what claim have the contractors, on their contracts being rescinded; and what can the architect charge in closing the affair with the contractors, and bringing the matter to a satisfactory issue with regard to materials partly prepared, such as joinery and cast-iron work.—FAIRATION.

[10375.]—**Road Embankment.**—In forming the embankment, having sloped sides, of a roadway, say some twenty yards above present surface, is there any objection to making the same principally of engine and other waste ashes to formation levels, and finishing on the top with ordinary sandstone lagging, balder, and gravel, rolled to form permanent way for traffic, as a public roadway.—ENQUIRER.

[10376.]—**Contract Stamps.**—Is a sixpenny stamp sufficient to make an ordinary contract binding, or should the value of the stamp vary with the amount of the contract?—DOUBTFUL.

[10377.]—**Flushing Tank.**—What form of flushing tank should be placed for collecting rain water, for flushing. Is not the siphon form the best? A reply from some practical reader will oblige—COUNTRY BUILDER.

[10378.]—**Rough-cast.**—Specification for "rough-cast" on exterior face of wall, also smooth surface to filling between half-timber framing on brickwork? Will frost affect either if work done in October?—OWNER.

[10379.]—**R.I.B.A. Exams.**—In the R.I.B.A. calendar it states that, among other probationary drawings submitted before Examination, is "a drawing from the round." Will you kindly say the kind of thing you consider suitable? Also a good work on "Renaissance" architecture.—GEORGE SPARKES.

[10380.]—**Building of Basements.**—Having read an interesting leader on the above in the BUILDING NEWS of October 29th, I would be glad to know the best method of constructing a basement wall, and how the thickness of the outer and inner walls are arrived at, and how the cavity could be effectually drained from any moisture, supposing it to be left open. For example: The building to be situated on a hill-side, the ground-floor level just above street on one side, and the basement level 13ft. below, the wall to be carried being 2ft. 6in. thick at ground-floor level. Perhaps a correspondent who has successfully carried out an example similar to the above, without showing signs of damp, will enlighten me? The earth on the high side would abut against basement wall.—P. S.

[10381.]—**Roof, Graphical Solution.**—Will someone tell me what are the proportions of load which a king-post truss should have at the feet of principals, half-way up the rafter, and at the ridge, to enable a correct stress diagram to be drawn? I find on looking at different treatises that the proportion of the W on each point varies. How is this?—A PUPIL.

[10382.]—**Altar Rail.**—How far should the Communion rail be placed from the east wall of chancel, and how many steps should there be within? Perhaps "H. W." will give his opinion and kindly oblige, as practice varies very much.—A. H.

[10383.]—**North Devon.**—Are there any interesting churches to be seen within twenty miles of Ilfracombe? Intending tourist will be obliged for any account of them.—TOURIST.

REPLIES.

[10324.]—**One Chimney to a number of Domestic Open Fireplaces.**—Seeing that there has not been a reply to this question, allow me to state that since asking it I have, in going over some old papers, come across an illustration of a residence called "The Cliffe," Eastbourne, Sussex (Mr. H. H. Vale, Architect), showing the flues from the various chimney breasts gathered together in the basement, and ran under a conservatory to utilise the heat from the main flue on its way to a tower rising considerably above the flat roof of residence. Can anyone say whether this building has been carried out, and if the flue construction is a success? If I remember rightly, the Accountants' Institute, London, has flues constructed on a similar principle. Will some of your readers give details or descriptive particulars of either of the foregoing, and how the throatings over fireplace openings are connected to downcast shaft, and whether it is necessary to use dampers to fireplaces not in use.—TOLOP.

[10345.]—**Colouring Cement.**—I have used Robinson's cement for outside walls both in brick and in half-timber work, and am very well satisfied with it. I have coloured it through about ⅛in. thick, using equal parts of sand and cement, and coloured with yellow ochre or Vandyke, according to the tint I required. I let the plasterer prepare a small sample to judge the colour from, as the colour when wet dries much lighter when dry. I question if a light tint could be obtained with Portland.—EDGAR WOOD.

[10353.]—**Proper Fall.**—House-drains should have a fall of not less than 1 in 60.—B. E.

[10355.]—**Reducing Bearing of Beam.**—The 8ft. bay will carry 22½cwt. distributed, and the 4ft. bay 45cwt. distributed, provided that the safe shearing strength of the beam is not exceeded, which without a section of the beam I could not tell.—B. E.

[10356.]—**Breaking Weight.**—The formula is—

$$W = \frac{60\,b\,d^2}{l}$$

where— W = breaking weight in cwts. distributed.
b = breadth of beam.
d = depth of beam.
l = span of beam, all in inches.

Substituting the dimensions gives a breaking weight of 324cwt. distributed.—B. E.

[10359]. — **Intercepting Chamber.** — W. P. Buchan's reply does not answer the question I put, which was: What part of the area is most convenient for a chamber? I am aware that the intercepting trap must be placed on the line of the drain. A chamber is really required in this case for easy access to the branches; the depth of drain requires a chamber. What should be its size? I thought about 3ft. by 2ft. 6in., and is it absolutely necessary that the back manhole should be in a line with it? Perhaps "C. J. K." or "W. P. B." will reply?—A YOUNG ARCHITECT.

[10362.]—**Fireproof Floor.**—It does not matter whether concrete, properly prepared with calcined materials, or terracotta, is used, as I believe both can be made absolutely fireproof. The interlocking bricks made by Messrs. Doulton and others are fire-resisting. William Lindsay's fireproof floor (see advt. last week) shows a good construction: the blocks, which rest on rolled joists at intervals, are hollow and interlock by means of a groove and tongue; upon this a layer of concrete is placed, and dovetailed-shaped fillets are inserted to secure the flooring boards. The air spaces left are desirable. Concrete would not expand prejudicially, and if the joists are protected on their lower flange, their expansion would be rendered unobjectionable. One of the most economical forms of construction is that of Dennett's, where the ironwork is completely incased, and the material forming the arches is thoroughly fire-resisting. The iron joists should have a certain play for expansion and contraction, and their lower flanges should be protected by terracotta or concrete.—G. H. G.

[10364.]—**Estimating.**—Read the "Notes on Building Prices," by Mr. John Leaning, now appearing in the BUILDING NEWS, which series is the most rational mode of treating the subject I have seen, and will doubtless give "T. W. C. E." all he requires. The tables given last week are very useful approximations.—G. H. G.

[10365.]—**Sanitary Inspectors' Examination.**—The best all-round book to prepare for examination in sanitary inspection is "A Practical Guide for Sanitary Inspectors," by F. R. Wilson, published by Knight and Co., price 4s. 6d.—ASSOC. SAN. INST.

[10366.]—**Enforcing Completion of Contract.**—"Architect" should be able to employ someone to complete contract, and charge cost to the contractor who refuses to complete the work. This is his only alternative if the contractor declines to do certain things. The employer cannot compel the contractor to finish without taking legal measures.—G. H. G.

[10367.]—**Strains in Roof.**—The method of sections applied to a roof is founded on the principle of taking a vertical line, and resolving the strains horizontally and vertically by means of the parallelogram of forces. All the resolved parallel forces acting in one direction should equal those acting in a contrary direction to produce equilibrium.—G. H. G.

[10368.]—**Portland Cement.**—To pass through a sieve of 2,500 meshes per square inch, without leaving more than 15 per cent. behind. When made up neat and filled into a glass botttle, and struck level with the top, it must not, in setting crack the bottle, nor rise out of it, nor become loose in it by shrinking. When made up neat and filled into moulds, and removed from the mould when set (which time must not exceed 24 hours) and immersed in water for seven days, it must withstand a breaking tensile strain of 350lb. per square inch of section. (Note: the briquettes should be gauged as dry as possible.) When made into patters ⅛in. thick, and immersing in water for any time, should not crack, swell, or shrink. It should not weigh under 110lb. per bushel.—B. E.

CHIPS.

A branch of the Bristol and West of England Bank for Clifton and Redland is about to be erected. The building has been designed by Mr. Henry Williams, and it will be erected on the site of Queen's Villa, near the Victoria Rooms.

New central schools, erected for the Pudsey School Board, in Chapeltown, Pudsey, from plans prepared by Messrs. Holtom and Fox, of Westgate, Dewsbury, were opened on Monday. The whole scheme, which is now completed, has involved an outlay of £6,000, the present school, which has been opened two years, costing £2,500, and the new mixed school and infants' department, just opened, about £3,400. The entire block is in the Gothic style.

The late Thomas Joseph Braham, of Hurley-gardens, South Kensington, has bequeathed his oil paintings by Abraham Pether and Sebastian Pether to the National Gallery.

A new Liberal club, built from designs by Mr. Thomas Ambler, has been opened in East Hunslet, Leeds, this week.

The St. Stephen's Schools, Canonbury, London, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

At the last meeting of the Aberdeen County Council Public Health Committee Mr. J. D. Watson, burgh surveyor, Arbroath, from a leet of six, was elected to the office of sanitary inspector for the county. The salary is £250 and travelling expenses.

LEGAL INTELLIGENCE.

PUBLIC HEALTH ACT, 1875.—BAD MORTAR.—At the Skipton Petty Sessions, on August 15, before his Honour Judge Ingham and other magistrates, William Sagar, a builder, of Barnoldswick, was summoned for constructing three dwelling houses at Barnoldswick, within the district of the Skipton Rural Sanitary Authority, with bad mortar. Mr. C. C. Smith, surveyor to the authority, produced samples of mortar which had been taken from the walls of houses, and also plastic mortar taken from the heap in use at the time of his visits, as well as a subsoil which the builder was using for sand. Benjamin Kirk, a builder and contractor, who had been in business 22 years, also gave evidence as to the improper mortar, which was in appearance that of sun-dried clay. The effect of wet weather and frost would be to cause all the mortar to crumble and make the houses very damp. The defendant, who was represented by Mr. W. A. Robinson, said he was building his houses of good mortar, and produced a sample of the sand which he said he was using. The Bench, however, considered the case proved, and fined defendant 10s. and costs. A further case against William Sagar was that he had constructed his party walls of 6in. instead of 9in. The defendant's solicitor put forth the theory that when the plaster was put on the walls they would be 9in. thick within the meaning of by-laws. For this offence the defendant was also fined 10s. and costs.

CLAIM FOR WAGES DURING A STRIKE.—At Marlborough-street, on Monday, Messrs. Stephens, Bastow, and Co., builders, of Stewart's-road, Wandsworth-road, were summoned by a number of their workmen for wages in respect to a job in South Audley-street. Several of the men were called, and stated that on their applying for their wages on Saturday, August 23, they received a sum of money on account, and were told that they could not be paid in full because the architect's certificate had not been received. On the following Monday and Tuesday they went to work, and continued at work till about 9 o'clock on the morning of the latter day. They remained on the premises during Tuesday, but did not work, and on the Wednesday morning on going to the job and hearing that no money was forthcoming they applied for and obtained the summonses, 28 in number. They claimed to be paid up to the Wednesday night, inasmuch as they were not discharged, but the firm on August 30 had paid them only up to the Tuesday morning. Some of the men then resumed work, but others insisted upon their claim for both wages and legal expenses. For the defence it was stated that, although the men were not formally discharged, they were told that if they would not work they might take their tools and go. They were not engaged under contract, and therefore could only claim for the work actually done. Moreover, although they were not discharged, they practically discharged themselves by declining to continue to work, and made no further claim at the time the balance of the wages was paid. Mr. Hannay said that by ceasing to work the men had committed an act for which they might at once be discharged; but as they were not formally discharged they were in strict legality entitled to pay for the whole of the Tuesday. But, in equity, it would be very harsh and unfair, under the circumstances, to make the masters pay for that for which they received no consideration, and he would therefore make no order in the case.

IN RE GEORGE LAW, KIDDERMINSTER. — A private meeting of the creditors of Mr. George Law, contractor, Kidderminster, was held on Friday at Birmingham. About forty creditors were present, and others were represented. The statement of affairs showed total liabilities £18,541 10s. 6d. The assets (including contracts complete or in progress, £4,500) are £7,296 11s., showing a deficiency of £11,244 17s. 6d. Mr. Dawes explained that the debtor's position was due to a series of losses on contracts, and among them he mentioned the Leicester contract for sewerage £5,000, West Bromwich ditto £3,000, Stratford £3,000, and Walsall £1,000. An offer of 5s. in the pound was rejected, but the creditors agreed to accept an amended offer of 7s. 6d. in the pound, payable at three, six, and nine months, the last instalment guaranteed.

THE GREEN-STREET IMPROVEMENT.—A claim for compensation arising out of the project for improving the communication between the Strand and Piccadilly by widening Green-street, Leicester-square, was decided on Friday at the Law Courts by Sir P. Edlin and a jury. Mr. Gabriel, the claimant, stated that in November, 1889, he bought for £3,325 some vacant freehold land, formerly known as No. 1, Green-street, and No. 31, Leicester-square, and entered into an agreement for the erection of buildings at a ground-rent of £250 a year. His witnesses estimated the present value of the land at between £6,198 and £6,325, whereas the vestry placed the value at something between £2,385 and £3,316, and questioned the genuineness of the building agreement. The jury awarded the sum of £3,823 15s., or 15 per cent. on the original purchase-money.

WATER SUPPLY AND SANITARY MATTERS.

EDINBURGH WATER SUPPLY.—At a meeting of the Works Committee of the Edinburgh and District Water Trust on Friday, the remit of the trustees in connection with the schemes for an additional supply of water was considered. The committee unanimously resolved to appoint as advising engineers Mr. Hill, C.E., the engineer of the Manchester Corporation, and Mr. Gale, C.E., the engineer of the Glasgow Corporation. Messrs. Hill and Gale will be requested to report on the following points:—(1) The capabilities of the existing undertaking of the trustees, having regard to the possible recurrence of a dry period; (2) the existing requirements of the whole community served by the trustees, keeping in view the almost universal use of w.c.'s and other improved sanitary appliances in Edinburgh and district; (3) whether they can suggest any more effectual means of suppressing waste than those in operation at present; (4) the probable future requirements, looking to the large increase in the population, and in the demand for trade purposes that has taken place since 1870; and (5) whether the time has come when the trustees should take action for the bringing in of an additional supply of water, and if so, to report along with the engineers of the Trust what scheme should be adopted, looking to the quality and quantity of the water to be obtained, the relative cost, and to the probability of its receiving the sanction of Parliament.

CHIPS.

During cleaning operations at the ancient parish church at East Ham, remains of old frescoes have been discovered under many coats of whitewash. They will be uncovered and left on view.

As the result of action recently taken by the Edinburgh Town Council, and at a cost exceeding £1,200, a road has been constructed at Abbeyhill to take the place of Rose-lane. The new road measures over 450ft. in length and 40ft. in breadth. The old lane was only 24ft. wide. The plans were prepared by the City Roads Department, and the work was carried out by Mr. William Gerrard, builder, Ivy-terrace, Edinburgh.

Garrigill Church was reopened on Friday. The restoration has involved re-seating, re-roofing, the construction of the chancel, the removal of the old gallery, and the replacing of the old by new windows. Mr. Hicks, of Newcastle-on-Tyne, is the architect, Mr. Turner and Mr. Hugh Kearton, of Alston, being the contractors for the mason and joiner work respectively.

The Earl of Dartmouth on Saturday laid the memorial centenary stone forming the basis of a number of external and internal improvements and alterations which are in progress at the church of St. James's, Slaithwaite. The church was built in the latter half of the 18th century, and does not lay claim to any architectural pretensions. It was decided some time since to restore the church, and the work has been placed in the hands of Messrs. John Kirk and Sons, architects, Huddersfield and Dewsbury, and the cost is estimated at £3,500.

The Local Government Board have issued to sanitary authorities a circular as to provisional orders under the Public Health Acts, the Local Government Act, 1888, the Housing of the Working Classes Act, 1890, and the Gas and Waterworks Facilities Acts. They direct that all applications for provisional orders under these enactments must be received by them not later than the 30th Nov., next, except that applications under the Lands Clauses Acts may be sent in up to the 21st Dec. The circular is accompanied by special instructions as to improvement schemes under the Housing of the Working Classes Act of last Session.

On behalf of the Local Government Board, Mr. Thornhill Harrison held an inquiry in the Town Hall, Newcastle-on-Tyne, on Friday, in reference to an application from the corporation of Newcastle to borrow £10,000 for paving purposes, and for the disposal of corporate land in the township of Walker and in Bath-lane. The city engineer, Mr. W. G. Laws, explained the proposals.

Mr. J. T. Harrison, C.E., instructed by the Local Government Board, held an inquiry at South Shields on Monday in reference to the application of the corporation to borrow £3,044 for street improvements; £1,115 for the construction of a bridge in Derby-street; £1,100 for the purchase of land at Westoe for the erection of branch police and fire-brigade stations; and £555 for the extension of the North Park and the provision of a public clock. There was no opposition.

The mansion at Holly Hill, Southampton, is undergoing internal renovation. The fine building erected for Mr. Quinton Hogg has suffered greatly from fires, as will be remembered. The present owner, Sir E. Walter, is having the restoration done by Mr. Green, of Blandford. Mr. Crickmay, of Weymouth and London, is the architect.

Our Office Table.

IN a letter to Monday's *Times*, Mr. Edwin Freshfield, F.S.A., remarks that the destruction by fire of the Mosque of St. Sophia at Salonica is one of the greatest losses which the students of Byzantine architecture could have sustained, short of the removal of its more celebrated namesake at Constantinople. Both churches were built in the reign of the Emperor Justinian, and at a later date that at Salonica had added to it the two apses to the north and south of the central apse, which represented a later style of Byzantine church arrangement. Built somewhat on the model of the Constantinople church, it had certain modifications of its model, not due only to its smaller size, but also to a further development of style. Retaining the central dome and eastern apse, it is without the four conchs, or semi-domes, which make so beautiful and picturesque additions to its fellow church and that of St. Sergius and Bacchus at Constantinople, and the church of St. Vitale at Ravenna. These four conchs appear in no later buildings, and the church of St. Sophia at Salonica is the first built without them. The same architect who built this church built also the church of St. Demetrius in the same city, and the details of the capitals of the pillars conclusively show, Mr. Freshfield thinks, that the same hand designed the details of the two before-named churches at Constantinople and the churches of St. Sophia and St. Demetrius at Salonica, and the church of St. Vitale at Ravenna. This will give some idea of the interest of the building now apparently lost to us—the connecting link between the first and latest styles of Byzantine architecture. Fortunately, we have some drawings of it published in Messrs. Texier and Pullan's well-known work, and two years ago Mr. Freshfield had a series of photographs taken of some of the details by a local photographer on the occasion of a visit there. They are not first-rate, but they are better than nothing.

UNDER the title of "Kirkstall Abbey Ruined,' the *Leeds Express* has published views of that beautiful 13th-Century Cistercian monastery church as it appeared a year since clothed with ivy and surrounded by trees and as it is now seen, its bare and blackened walls having been stripped by order of a committee of the town council of all their picturesque environments. While the removal of the ivy from the walls was necessary, there was surely for the present no need to level the site and grub up the fine trees which gave protection from the wind, and those in charge of the operations cannot be acquitted of blame for carelessness, for it will be remembered that an elm was allowed in May to fall across the refectory wall, bringing down tons of masonry and doing more mischief than all the vegetation and trees in the grounds would have effected in half a century had they been suffered to remain. Similar injury was wrought by a newly-appointed vicar to the sister abbey of the same order at Netley some 20 years since under the like plea of preservation. The mistake made by corporations in the case of public parks and abbey ruins, is that they are guided in their ideas of treatment by the gardeners whom they appoint as custodians, and who naturally conceive they must "keep on doing something" to justify their existence.

FOLLOWING, though not in chronological sequence, the Stuart and Tudor Exhibitions held at the New Gallery during the past two winters, an exhibition of pictures and objects of interest connected with the Royal House of Hanover, from the accession of George I. to the death of William IV. (1714-1837), will be on view at the same gallery from January to April of next year. The scope of the exhibition will include not only portraits of the Royal family, but also those of the most famous statesmen, lawyers, divines, naval and military commanders, and the representatives of art, literature, and science in a sufficiently wide field. The exhibition will also comprise miniatures, prints, drawings, books, manuscripts (including autographs), embroideries, plate, porcelain, coins and medals, seals, and personal relics.

THE three pictures purchased from Lord Radnor's collection at Longford Castle for £55,000 were temporarily placed on view on screens in the Umbrian Room of the National Gallery yesterday (Thursday). The chief one,

Holbein's "Ambassadors," a panel picture 8ft. square, representing a full-length figure of a man in a magnificent costume (probably Jean de Dinteville), and a second person in the dress of a Protestant doctor standing behind a table covered with astronomical instruments; the accessories are numerous and splendid. This work is signed and dated 1533. The other works are a full-length portrait of the soldier Adrian Palido Pareja, inscribed "Did. Velasqz. Philip IV., a cubiculo ejusque pictor, 1639"; and a portrait of an unknown man by Moroni.

By the death of Miss Helen Watson the Scottish National Gallery in Edinburgh has been enriched by a large and valuable collection of paintings, engravings, missals, frescoes, &c., the bequest of her brother, Mr. William Finlay Watson, long a bookseller in Princes-street, who died in 1881. Among the paintings are Wilkie's original sketch for "The Penny Wedding," a couple of Turners, evidently early works; paintings by Vandyck, David Roberts, Holbein, Alexander Nasmyth, Hamilton (the Scottish Vandyck), and Hogarth; while the portraits include those of Prince Charlie, Queen Mary, Edmund Spenser, Shakespeare, Allan Ramsay, Henry Mackenzie ("The Man of Feeling"), Charles I., Darnley, George Buchanan, Smollett, Columbus, the Admirable Crichton, James Watt, and many other notabilities. To the Museum of Science and Art in Chambers-street, Edinburgh, Miss Watson has bequeathed a collection of china of rare value, with a great variety of specimens of antiquarian and historical interest, such as the dressing-gown of Napoleon I. and Clarinda's tea-tray, cup, and saucer from which Robert Burns drank tea.

A German paper points out that sheet zinc, when in direct contact with brickwork, suffers to an appreciable extent from rapid corrosion. In building the Berlin city market halls, a portion of the zinc work which rested upon brick walls was found to be deeply pitted at a number of places, particularly where the metal was close to the bricks. Chemical examination of these resulted in showing that they contained as much as 1·14 per cent. of soluble salts, of which the destructive effect increases by moisture. The proportion of such salts varies with different kinds of brick, while in some there may be nothing to induce any such corrosion. As a preventive, roofing felt or similar material may be placed between the zinc and brickwork.

The *Kew Bulletin* contains a section on the properties and uses of the jarrah wood, a species of eucalyptus, native to Western Australia. The main difficulties in connection with its use in this country are the cost of freight for such heavy timber from Australia, and its intense hardness, which makes it difficult for ordinary English carpenters' tools to work it. The tree which produces it grows generally to a height of 100ft., and sometimes 150ft. It is found only in Western Australia, forming mainly the forest of that colony. According to Baron Mueller, when selected from hilly localities, cut while the sap is least active, and subsequently carefully dried, it proves impervious to the boring of insects. It has been tried at three places in the Suez Canal, and, after having been down several years, the trial samples were taken up in order that a report on their condition might be sent to Paris. Jarrah has lately been used by the Chelsea Vestry for paving the King's-road, and by the Lambeth Vestry in the Westminster Bridge-road.

The time-table of the day and evening classes in civil engineering, building construction, architecture, plumbing and sanitation, to be carried on next session at the Glasgow and West of Scotland Technical College, has just been published. The courses of study are based on those of the Science and Art Department and the City and Guilds of London Institute; but the honours classes in the sections of building construction and architecture, which are conducted by Mr. Charles Gourley, A.R.I.B.A., are specially valuable features.

Experiments are being conducted in the Channel near Folkestone for the purpose of testing the geological structure of that portion of the sea-bed upon which it is proposed to construct a bridge across the Straits. The engineers in charge of the work are M. Georges Hersent and M. Renaud, marine hydrographic engineers. The examination of the French coast is finished, and so far as it has proceeded on the English side of the Channel it has, it is stated, proved very satisfactory, the sea bottom being very solid and suitable for the proposed structure. There is comparatively very little variation in the depths except at the sand-banks, which would be bridged over.

Trade News.

WAGES MOVEMENTS.

Barnsley.—The bricklayers' strike has been settled. The men agree to accept 8½d. per hour and some alterations of rules in settlement of their demand, which was originally for 9d. per hour.

Newcastle-on-Tyne.—The Newcastle Branch of the Amalgamated Workmen Slaters having given notice for an advance of wages of a halfpenny per hour, a meeting of the master slaters has been held, when it was decided to grant the advance.

Northwich.—The carpenters and joiners of this town are on strike for an advance of ½d. per hour, and a reduction of one hour on Saturdays.

Olney, Beds.—The building agitation has subsided, the masters having granted the demands of the men both as to shorter hours and increased wages. Thus all danger of a strike is obviated. The men will in future work 56½ hours per week, at 5½d. per hour, and all hours extra will be paid for at the rate of 6d. per hour.

Plymouth.—After a suspension of work for between six and seven weeks the masons of Plymouth resumed work on Monday morning, having come to an arrangement with the Master Builders' Association. The men ceased work suddenly in the latter part of July, after laying before the masters a new set of rules, the principal features of which were the entire abolition of piecework, and a demand that no dressed stone, with one or two exceptions, should be allowed to come into the town. It was arranged on Saturday that work should be resumed on the basis of the practical abolition of piecework, except in the case of old contracts running on that system, and that the masters, with regard to dressed stone, might bring it from where they pleased, and work it where they pleased. There was thus no question of either time or wages in dispute, and the strike has cost the men some £3,000. There have been considerably over 200 masons out of work, and they have kept a number of carpenters and labourers unemployed.

CHIPS.

Portland-street Congregational Church, Southport, has just been reopened after undergoing considerable alterations, additions, and decorations. The whole work has been carried out from designs prepared by Mr. C. Sydney Ingham, architect, of Manchester and Southport.

A new watering-place is about to be developed on the seaside portion of the Tankerton Estate, between Whitstable and Herne Bay. The project has been undertaken by the new Lord of the Manor of Whitstable, Mr. Newton-Robinson.

A new block of buildings intended to be used as workshops and stores at the gasworks at Stafford is now almost complete. The building is of red and blue brick, from the designs of Mr. J. F. Bell, the engineer of the works. Mr. W. Reynolds was the contractor, and the cost was £900.

Memorial stones of the new Congregational Chapel on Richmond Hill, Bournemouth, were laid on Wednesday week. Seats will be provided for about 1,100 worshippers. The building throughout is of Late Gothic design, the materials to be used being Swanage stone facings, with Bath and Portland stone dressings. Most of the materials of the old chapel will be utilised in the new building. The contractor is Mr. Kingerlee, of Oxford, the contract price being £10,643, but with furnishing the total cost will be about £12,000. We illustrated the new building, which is being erected from plans by Messrs. Lawson and Donkin, of Bournemouth, selected in a local competition, in our issue of Dec. 13, 1889.

The annual excursion of the members of the Glasgow Archæological Society took place on Tuesday, when St. Andrew's, Leuchars Church, and Earlshall were visited.

Terry's Theatre in the Strand is being redecorated by Messrs. Campbell, Smith and Co., of Newman-street, Oxford-street, W.

A scheme is about to be floated for a "ship railway" to carry coal by sea and land from Cardiff to London and the English Channel ports. The route is across the counties of Somerset and Devon between Bridgwater and Seaton. The proposed undertaking has the approval of Sir Wm. Thos. Lewis and others interested in the prosperity of the district, and will be explained to local merchants by Mr. W. Smith, Aberdeen.

A receiving order has been granted in the case of Edwin Finch Spragg, of Saltoun-road, Brixton, surveyor.

A new police station has been erected at Leman-street, E., and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by Messrs. Robert Boyle and Son's latest improved patent self-acting air-pump ventilator.

A new Brynyffynnon Wesleyan church was opened at Wrexham on Friday by the Rev. C. H. Kelly, ex-president of the Wesleyan Conference. The new buildings occupy the site of an old chapel in Regent-street, and comprise a church and school, with ample vestry and classroom accommodation. They have been designed in the style of English Gothic which prevailed in the 13th century. The architects are Messrs. William Waddington and Son, of Manchester and Burnley.

Holloway's Ointment and Pills.—The Ointment is a wonderfully healing application, as it cleanses the surface of foul sores and ulcers, soothes the throbbing and pain in cases of inflammation, and checks the progress of skin diseases. The Pills purify the blood, cleanse the liver, and remove all noxious matter from the system.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

Aberdeen.—For additions to the lairage at Pocra jetty, for the harbour board:—
Gair, R., Aberdeen (accepted) ... £517 0 0

Aberstoke.—For the erection of iron emergency staircases, and alterations to wards at the Aberstoke House of Industry. Mr. W. Yeardye, Gosport and Fareham, architect. Quantities supplied:—

Plummer, J., Fareham	£138	0	0
Crockerell, J., Portsmouth	137	0	0
Croad, J., Gosport	131	0	0
Lear, C. J., Aberstoke	128	0	0
Rapley, W., Gosport	115	14	6½
Dash, C. M., Gosport	115	13	8
Hall, T. P., Southsea (accepted) ...	99	0	0

ABERSTOKE.—For alterations, additions, repairs, &c., at the Aberstoke National Schools. Mr. W. Yeardye, Gosport and Fareham, architect:—

Rapley, W., Gosport	£488	1	0
Lear, C. J., Aberstoke	454	1	1
Croad, J., Gosport (accepted) ...	420	9	0

AXBRIDGE.—For works in connection with the Weare water supply, for the rural sanitary authority:—

Simmons, of Cheddar (accepted) ... £49 10 0

BARNSLEY.—For the alteration of the Harvey Institute, for the town council:—

(Accepted tenders.)

Masonry, joiners, and slaters:—

Robinson and Sons	£910	0	0

Plasterer:—

Flemming	25	0	0

Plumber and glazier:—

Rusforth, S.	38	12	6

Patent glazing:—

Helliwell, J. W....	33	14	6

BATHGATE, N.B.—For the execution of a drainage scheme, for the burgh commissioners. Messrs. Leslie and Reid, Edinburgh, engineers:—

Macknight and Son, Uphall ...	£4,127	8	11
Brebner, R., Edinburgh	4,090	7	6
Nimmo and Cowpar, Blairadam*	4,008	15	7

* Accepted.

BETHNAL GREEN.—For building a hospital in Austin-street, Bethnal Green, E. Mr. R. H. Hill, 3, Lombard-court, E.C., architect:—

Langdale and Hallett	£12,000	0	0
Chappell, J. T.	10,201	0	0
Nightingale	9,954	0	0
Holloway Bros.	9,581	0	0
Marsland	9,475	0	0
Outhwaite and Co.	9,445	0	0
Mortar, J.	9,420	0	0
Coxhead, J. J.	9,333	0	0
Gregory, T.	9,287	0	0
Lawrence and Son	9,275	0	0
Holloway, H. L.	9,173	0	0
Greenwood, J., and Son	9,155	0	0

BROMLEY, KENT.—For making up the playgrounds at Aylesbury-road Schools, for the school board:—

Gill	£237	0	0
Lansbury	105	0	0
Peill (accepted)	97	0	0

BURTON-ON-TRENT.—For the enlargement of the infants' and girls' schools at Stapenhill, for the Burton school board:—

Chamberlain Bros., Burton (accepted) ... £753

BURTON-ON-TRENT.—For the extension of Wetmore-road board schools:—

Vernon, H., Derby (accepted) ... £2,531 16 0

DOUGLAS.—For marble mosaic paving, Victoria Pier, Douglas, Isle of Man. Mr. H. A. Cheers, Twickenham, architect:—

Mainzer and Kempthorne, 18, Berners-street, W. £330

(Accepted.)

FAREHAM.—For alterations and additions at the Fareham Union Workhouse. Mr. W. Yeardye, Gosforth and Fareham, architect. Quantities supplied:—

Boulton, H. F., Buckland... ...	£1,385	0	0
Blackman, G. H., Fareham ...	1,270	0	0
Croad, J., Gosport	1,260	0	0
Jones, H., Southsea...	1,190	0	0
Love and Son, Gosport	1,185	0	0
Hall, T. P., Southsea	1,184	0	0
Learmouth, W., Portsmouth ...	1,164	1	0
Tuite, E , Fareham	1,160	0	0
White, F. G., & Sons, Portsmouth	1,158	0	0
Conway, C., Wickham	1,149	18	0
Snee, W., Landport	1,131	0	0
Fullford's Trustee, Fareham ...	1,105	0	0
Wareham, C., Stubbington ...	1,054	0	0
Plummer, J., Fareham	1,050	0	0
Crockerell, J., Landport	1,010	0	0
Stallard, G., Havant (accepted) ...	1,010	0	0

FORTON.—For alterations, &c., to premises, Forton-road, to form shop. Mr. W. Yeardye, Gosport and Fareham, architect:—

Dash, C. M.	£67	5	0
Croad, J.	63	0	0
Jupe, C.	62	0	0
Crockerell, J. Landport	50	0	0
Rapley, W. (accepted)	40	6	9

Rest of Gosport.

GOSPORT.—For the erection of iron building to form new library. Mr. W. Yeardye, Gosport and Fareham, architect:—

Croad, J., Gosport (accepted) ... £159 0 0

GOSPORT.—For additions to house in North Cross-street, Gosport. Mr. W. Yeardye, Gosport and Fareham, architest:—

Dash, C. M., Gosport (accepted) ... £63 10 0

HEREFORD.—For the erection of farm-buildings at Longtown. Mr. G. H. Godsell, Hereford, architect:—

Prosser, J., Longtown (accepted) ... £100 0 0

HEREFORD.—For alterations and additions to the Spread Eagle Hotel, for the Alton Court Brewery Co. Mr. G. H. Godsell, architect:—

Loyd, J.	£390	17	0
Davies, J.	389	0	0
Lewis, W. P., and Co.	382	0	0
Taylor, R. (accepted)	370	0	0
Watkins, J.	325	0	0
Hiles, J.	315	0	0

All of Hereford.

HIGHBRIDGE.—For extending the water mains in Highbridge 1,700ft., for the Axbridge rural sanitary authority Palmer, S. (accepted).

KEIGHLEY.—For iron railings at the new cemetery, for the burial board:—

Clayton, Son, and Co., Hunslet, Leeds (accepted) ... £226

KINGSLAND.—For alterations at the Duchess of York Tavern, Kingsland-road. Mr. R. A. Lewcock, 88, Bishopsgate-street Within, E.C., architect:—

Goodall, S. (accepted) £578 0 0

Gasfittings:—Winn, W. (accepted).

Counter and pewtering:—Heath, T. (accepted).

KNIGHTON.—For the supply and laying of 4in. and 3in. cast-iron pipes, for the new water supply, between the Frydd Reservoir and Cwmever, for the local board:—

Kell and Prince (accepted).

(Lowest tender received.)

LAMBETH.—For pulling down and rebuilding the Jolly Gardeners Tavern, Princes-street, Lambeth Walk. Mr. R. A. Lewcock, 88, Bishopsgate-street Within, architect:—

Anley, J.	£6,047	0	0
Ivory, J.	6,030	0	0
Gould and Brand	5,889	0	0
Spencer and Co.	5,838	0	0
Harris and Wardrop	5,644	0	0
Goodall, S.	5,470	0	0
Todd	5,414	0	0
Allen and Sons	5,348	0	0
Voller	5,262	0	0

LINCOLN.—For new Liberal Club. Messrs. T. Snigton and W. Bramald, Manchester, architects:—

Hockley, R., and Son, Grantham	£3,050	0	0
Reid, Blight, and Co., Plymouth ..	2,986	10	0
Bridgefoot and Son, Peterborough	2,485	0	0
Bowman, E., Stamford	2,457	0	0
Wright, W., and Son	2,405	13	0
Close, H. S. and W....	2,345	0	0
Horton, S.	2,285	0	0
Harrison, J. B.	2,247	19	0
Crosby, R.	2,241	0	0
Lansdown and Son (accepted) ...	1,970	2	4

Rest of Lincoln.

(All tenders are exclusive of heating throughout with hot water.)

LIVERPOOL.—For supplying and fixing wrought-iron unclimbable railing, with gateway, at the City Hospital North, Netherfield-road, for the city council:—

Smith, R. T. & Co., Whitchurch, Salop (accepted) £42 10

LIVERPOOL.—For repairs to Falkner-square, Great George-square, and Abercomby-square gardens, for the city council:—

Hignett, W. (accepted) £97 10 0

"THE LONDON GRATE"

(Jennings' and Owen's Patent.)

IMPROVED

WARM FRESH-AIR VENTILATING GRATE.

Adopted in the Bank of England, Threadneedle-street, and the New Law Courts Branch; Wonford House Asylum, Exeter; New Cottage Hospital, Blackheath; AND MANY OTHER PUBLIC AND PRIVATE BUILDINGS.

GEORGE JENNINGS,

SANITARY ENGINEER, STANGATE, LONDON.

AWARDED THE GOLD MEDAL, PARIS EXPOSITION, 1889.

TWELVE GOLD AND SILVER MEDALS AWARDED.

ZINC ROOFING.

F. BRABY & CO., LD.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIX.—No. 1863.
FRIDAY, SEPTEMBER 19, 1890.

STREET REBUILDING AND WIDENING.

DURING the last ten years many of the streets of London have become almost wholly transformed. Some parts of the City have been rebuilt entirely. One side of Ludgate Hill, for instance, has been completely changed in appearance. The greater portion of the old houses on the south side have been swept away, and in their place stately blocks of business premises have been erected. The setting back of the building line and the consequent widening of the roadway has been an important improvement as far as it extends, though not one that has yet benefited the thoroughfare to which it belongs as a whole. So long as there remains anywhere along the route a narrower part, any widening operation does not benefit. As the strength of a chain is determined by its weakest link, we may analogously affirm that the capacity of a thoroughfare must be estimated at its narrowest point, so that if beyond any setting back of houses the old lines remain, the improvement is doubtful, or, at least, has little practical value; and it is just this piecemeal mode of reconstruction and widening that renders London so disjointed and disorganised a city, full of half-completed and partial schemes, stopped ends, and hoardings—a good illustration of the want of co-operation between the two local governing authorities of the Metropolis, and the hostility that will ever prevail between private and public rights. The intention of widening a street under an Act of Parliament is soon noised abroad; property owners are placed on their guard, and quickly attach fabulous values to their properties; lessors and lessees combine to frustrate the authorities, and schemes are only partially carried out. It is a misfortune also that there is not more judgment exercised before properties are scheduled, as a great deal of unnecessary opposition is brought to bear against schemes that appear visionary and unnecessary on paper. The fragmentary manner in which street widening and rebuilding have been proceeded with may be noticed not only in Ludgate Hill, but in some of the streets leading from Charing Cross-road, the Shaftesbury-avenue, Bloomsbury, the streets between Holborn and Islington, and in various other parts in which public improvements have been contemplated. Instead of one thoroughfare being taken in hand and completed, half a dozen beginnings are made, a few houses are cleared, and the gap remains; next to houses in occupation hoardings are placed, creating a nuisance to adjoining owners and traders, and business is diverted into other channels.

But we rather dwell here on a few of the salient features of these new schemes, and we here mention only what has been done in one or two parts. Although Ludgate-hill has been only partially transformed on the south side, there will be shortly an almost unbroken line of new offices and premises from the Circus to St. Paul's. A large gap caused by the removal of a number of houses will shortly be filled up by the City Bank, which will occupy a site opposite the Old Bailey. We can hardly yet realise the effect of the widening and rebuilt side—certainly much of the picturesqueness of the broken line of frontage will be lost. On the north side the few new premises that have been erected have contributed to the general view. Messrs. Hudson Brothers' newly-built red-brick premises have one point worth noticing that may be usefully followed in our street architecture. The ground-floor story or shop front is set back within the front wall by an arcade of two wide arches, elliptical in shape, which support the façade. This arched treatment of the ground story, as it carries down the front by massive columns, is certainly more satisfactory than the usual breastsummer resting on a huge plate-glass shop-front. The arches and spandrels are of grey granite, supported on granite columns. The width of each arch and its height give ample room for the shop-front, which is recessed two or three feet back, and very little light is lost by the recession. The handsome gabled red-brick façade is a pleasant break to the lines, and when the hideous "sky signs" are removed, which the proprietors have magnanimously agreed to do, and have, in fact, begun to take down, the new front will be rather an ornament than otherwise. The subordination of the shop-front is not a thing which the ordinary City tradesman can quietly bring himself to acquiesce in; but if a few leading firms followed the example of the recessed window, throwing a foot or two more into the footway, one might soon see a marked improvement in our street architecture. Already the supremacy of plate glass appears to be on the wane; mullions, transoms, and ornamental squares filled with "leaded quarries" are taking the place of bare glass and its unmitigated vulgarity.

The present "dull" season has been taken advantage of by the City authorities for the repaving of Fleet-street and other parts of the City. By this arrangement there is probably less inconvenience suffered by the public than if the operation were deferred to a later season of the year; but, still, the process of renewal of the wood pavement becomes yearly a more serious block to the traffic of a main artery. What the consequences would have been if the Thames Embankment had not been formed one cannot imagine, except that only a section or two of the thoroughfare could have been undertaken at a time, while the traffic of vehicles would have to suffer repeated blocks during the day. The necessity of periodical repair of the roadways of our streets is a strong reason for the adoption of other alternatives, and must ultimately lead to the making of underground subways or high-level roadways along our principal thoroughfares. Those who propose these measures, and introduce Bills into Parliament, know very well that these alternatives must come sooner or later, and that if they meet with opposition, it will get weaker and weaker until the scheme is carried, and then people, even the aforesaid opponents to the Bill, will wonder why they could have been so stupid, and why the advantages of subway travelling had not been adopted before, and so much inconvenience, impeded traffic, street dangers, and cruelty to horses were endured so long.

The practicability of constructing high level or duplicate roadways is quite obvious, and our existing streets could practically remain as they are for heavy traffic, while the upper viaduct, say 16ft. high, could be used by pedestrians. There could be stairways at intervals connecting the upper with the lower roadway. Shops possibly could be built on the upper level, or heightened a story. But there is no necessity for a viaduct of great width. Why not construct galleries over the present pavement, high enough for goods traffic beneath, with stairs at intervals, and foot-bridges to connect the galleries at convenient points. Nothing more would be wanted to relieve the present crowded streets, and give room to both kinds of traffic. The galleries might rest on light iron girders and arches supported by light iron pillars at intervals; the architecture would not suffer—indeed, be somewhat improved by the piazza-like effect that would be produced, and it would not be long before architectural skill could find the means of converting this structural necessity into one of value. The covered footway is one of those features that might be revived; indeed we can imagine a two-storied open structure, the lower one used as a viaduct for pedestrians, and the upper an arcade covered. Our traffic, which is increasing to an alarming extent, is rendering an elevated footway a necessary requirement, if we strongly object to the alternative of a subway or underground railway. We are bound to look these necessities in the face; and if we do not want to imitate our American friends by having such hideous things as elevated railroads to compete with equally unsightly sky-signs, the sooner we can invent a more sightly means of locomotion the better.

From another point of view our streets present us with a standing record of the variety of colour and durability of the principal building materials. Who has not noticed, that has walked through Oxford-street, or even down Fleet-street, the variety of tone and texture of the fronts of business premises, from the dingy brick to the blackened Portland, through every intermediate shade of yellow and red? These different materials resemble somewhat what we find in nature. We find texture everywhere; even the stone quarry supplies us with instances of harmonies; the smooth stone or slate is fretted with lichen or moss, producing the most delicate harmonies of tint, the broken surfaces of cliff and rock subdue the light and colour by almost imperceptible degrees, and architects would do well to study the value of this quality more than they do. One writer truly says texture is a quality of surface independent of designed form, and if he means by this the texture derived from material, roughness or smoothness of surface, reflection of light, transparency of material, and other peculiarities, we can fully appreciate the merit. But there is another kind of effect in buildings that may be called by the same name. By texture we may denote the quantity and quality of the surface relief or ornamentation, the proportion of openings to voids or wall space, the direction of the main lines in the building, whether vertical or horizontal. Whichever kind of texture we employ—and we see no reason why there should not be both—let us adopt a rational means of using it in our architecture. A long row of stuccoed fronts painted a stone-colour may be intolerable if there is nothing to break the line of façade, no projections and shadows to give variety and tone. Stone of one colour, if employed in a row of buildings of the same measured regularity of windows, is equally intolerable; but if we have bays and recesses, and now and then a square or a crescent, even such a long stuccoed front as that to the sea at Brighton may be made endurable. The elements of texture in architecture are not only materials, different coloured sandstones and limestones, bricks and terracotta, stucco, and parquet, but the windows, recesses, and projections, which produce lines of shadow, which break up into lights and darks the surfaces of our buildings. A succession of bay windows or gables, for example, will break up the light which falls upon it, and by presenting a variety of dark shadows and light-reflecting lines considerably modify the tone of the street. We have observed that even a certain shape of window will produce a variety of tone in a number of similar houses. Strongly-marked eaves, balconies, colonnaded fronts, produce texture in the *ensemble*. Nevertheless, strange to say, these are not elements which the architect takes into consideration; they are neglected and accidental attributes of his building, which count for something in spite of himself, and are no less powerful in the general appearance of our towns.

THE SYMBOLISM AND ICONOGRAPHY OF EARLY AND MEDIÆVAL CHRISTIAN ART.—XIV.

By George Ashdown Audsley, F.R.I.B.A.
(Author of "Handbook of Christian Symbolism," and several works on Architecture and Art.)

APPLICATION OF THE AUREOLE.

WE now come to the consideration of the application of the Aureole according to Mediæval authorities, and our remarks shall be as brief as the subject permits of.

There can be no doubt that the Aureole has, in Christian Iconography, always been considered as strictly the attribute of the Deity; and, even when the greatest liberty was taken with it, it could only be extended with any degree of appropriateness to the symbols of the Persons of the Holy Trinity, or to heavenly personages who were understood to be direct repositories of the power and glory of the Almighty. With such an idea in view the 13th-Century artist depicted the Thrones, in the glass of Chartres Cathedral already spoken of, invested with crimson-coloured Aureoles, because they were recognised, in the iconography of his time, as the delegates of God's majesty and power. Such, then, is the strict rule respecting the application of the Aureole; but, as might be expected, this rule could not obtain without some exceptions. The most noteworthy exception is presented by the portraitures and representations of the Virgin Mary in the dignified position of "Queen of Heaven." Considering the high veneration in which the Virgin was held throughout the Middle Ages, it is not in any way remarkable that the Christian artists of this epoch should strain a point in her favour and bestow upon her the divine attribute.

The Aureole has never, to our knowledge, been applied to the representation of a human being in the flesh; but it has been shown in Fig. 29 (Article XI.) that the Aureole, in a certain treatment, has been applied to the representation of the human soul in its ascension to Heaven. Such an application, however, is incorrect, and forms one of the many mistakes and abuses which the student continually meets throughout the entire range of Christian art. More flagrant instances of the misapplication of the attribute are to be found; for instance, in a miniature in a tenth-century Bible, preserved in the British Museum, Satan is to be seen invested with an Aureole of a gloomy hue. The subject of this curious and interesting miniature is the Fall of the Rebel Angels; it occupies the whole of the first page, and is treated with considerable power. It is thus described by Mrs. Jameson:—"The Deity—for there is no nimbus to indicate which Person of the Trinity*—sits solemnly in an almond-shaped glory, upheld by two angels; while two more hide their hands, in token of respect, beneath their drapery. From the threshold of heaven the angels are seen falling in attitudes indicating no small knowledge on the part of the unknown artist of nine centuries ago. They are in human forms—denuded of wings and drapery—the angel stripped till nothing but man is left. Their faces are caricatures—those lowest being the most hideous; Lucifer himself lies beneath, brutified already with a tail—his person enveloped, strange to say, in an almond-shaped glory,† which a red dragon seizes in his jaws and encircles with his coils. This is a unique instance, it is believed, of Satan thus encircled with an attribute hardly seen even surrounding the persons of angels. But here all its glory is dimmed. It is dull and dark, and was probably introduced to distinguish the arch-rebel from his followers." There is little doubt that such was one of the intentions of the artist; but we do not think it was the chief one. By investing Satan with the Aureole, the limner evidently desired to show from what high estate the rebel angel had fallen—that while in heaven he was one of the Thrones, a delegate of the Most High; and by destroying the radiance of the attribute, and subjecting it to the dragon of destruction, he desired to show that in hell even the faintest remnant of his former greatness should be for ever swept away.

Whilst on the subject of exceptions we may direct attention to the rare use of the Aureole to the lesser symbols. In Fig. 38, in addition to the chief Aureole of quatrefoil shape, are four lesser circular Aureoles, appearing from behind the cusps, and containing the symbols of the Evangelists. We find ample proof that these circular portions were intended for Aureoles on referring to a very Early work, in the catacombs of Rome, illustrated in the accompanying Fig. 41. Between the arms of the cross are four discs containing

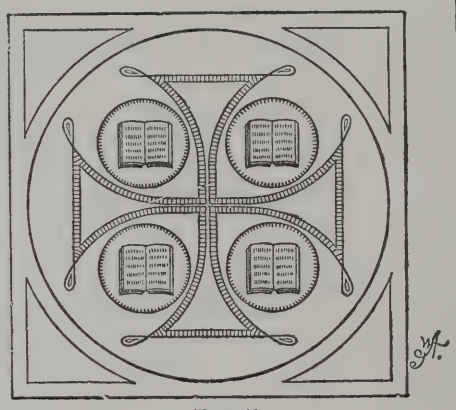

Fig. 41.

open books; these books are the Four Gospels, and, in the guarded symbolism of the Early Christians, represent the Four Evangelists. To express their importance and high dignity, their symbols are placed within Aureoles. The student of Christian Symbolism must not be led by these examples to conclude that when he sees a symbol, or monogram, placed within a circle the Aureole is intended, for in the generality of instances nothing beyond a framework or defining line is aimed at. Sometimes, however, the circle is evidently introduced as the emblem of eternity. As a rule, when a clearly-defined circle, or ring, is shown surrounding a cross, or a monogram of the Sacred name, the circle may be accepted as an emblem, and not as the margin of an Aureole. It is quite evident that, in Fig. 41, the large inclosing circle is simply part of a framework, and has neither a symbolical value nor anything to do with the Aureole. In all questions of this kind the student must use his own judgment in deciding. There is generally no difficulty in discriminating when one has mastered the rudiments of Christian Symbolic art.

The Aureole, in its true significance, and in its true character as a field of radiant splendour, is *par excellence* the attribute of God the Son. It is seldom given to Him in scenes which depict His life on earth; but consistently appears in those which follow the Crucifixion. The two scenes before the Crucifixion, in which Christ has been depicted invested with the Aureole, are the Baptism and the Transfiguration. In the latter instance, its introduction is perfectly consistent, and it becomes a legitimate agent in the artist's hands to set forth the supernatural radiance which surrounded the body of Christ. In the case of the Baptism, the introduction of the attribute does not appear so appropriate. We are not told that any radiance surrounded our Lord, so it is highly probable that the Aureole has been resorted to to record the declaration from Heaven: "This is my beloved Son"; as well as to express the brightness of the Spirit of God which descended like a dove, and rested upon Him. In the Benedictional of St. Æthelwold, Christ is depicted, at His Baptism, invested with both the Aureole and the tri-radiated Nimbus; while the Holy Spirit descends as a Dove, bearing a peculiar object in its beak (probably a double ampul), but without an Aureole or the divine Nimbus round its head. Of the Aureole of the Transfiguration we have already spoken at some length.

Immediately after our Lord dies on the cross, His divinity is proclaimed in art in an unmistakable way; the matter of fact or historical aspect of the Crucifixion gives way to the symbolic and dogmatic, and the great attribute of the Deity spreads its luminous field behind the cross on which hangs the dead Savour. In addition to this, the relation of Christ to the Godhead is set forth by the introduction of the portraiture of God the Father, and the symbol of the Holy Ghost. This treatment, however, does not obtain prior to the 13th century, and, indeed, very rarely until the 14th century. An example of the treatment just alluded to is given in Fig. 42, taken from the central compartment of a 14th century triptych, preserved in one of the chapels of the Cathedral of Naples. Here God the Father, in the form of an aged man, embraces the crucifix, and breathes his spirit on the dead Saviour. The Holy Ghost, in the form of a dove, hovers in the breath of the father, just where the upper limb of the cross should be. The lenticular Aureole, with a plain field, and supported by Seraphim, almost entirely incloses the group. Above the Nimbus of the Father is the emblem of Christ—the pelican vulning its own breast. D'Agincourt gives another example of this treatment, from a 14th century painting by Barnabas de Mutina, in which the lenticular Aureole, covered in its field with divergent rays, is introduced.

In the scenes subsequent to the Crucifixion, figures of Christ are commonly invested with the Aureole. In the Resurrection the figure of our Lord is represented ascending from the tomb, invested with the attribute, and bearing in his hand the cross and banner of victory, as in the fine painting by Perugino in the Vatican. The next great event which art records, and in which the Aureole almost invariably appears in Mediæval works, is the Ascension. It is, however, occasionally met with in the earlier scenes in which Christ appears to His disciples. In the miniature of the Incredulity of St. Thomas, in the Benedictional of St. Æthelwold, Christ is depicted in a lenticular Aureole, invested with the tri-radiated Nimbus, and carrying the cross of the Resurrection. The lower part of this Aureole, showing the feet of Christ resting on an arched member, is given in Fig. 33 (Article XI). From the same superb manuscript we have given, in Fig. 32 (Article XI.), the drawing of Christ invested with the Aureole, as presented in the interesting miniature of the Ascension. We have before directed the student's attention to the peculiar treatment of this Aureole, which has evidently been adopted by the limner with the view of showing that the attribute is behind and following the figure. In the fresco of the Ascension, by Giotto, in the Chapel of the Arena, at Padua (now almost entirely effaced), the figure of our Lord is depicted more fully in side view than that in the Benedictional, but no attempt has been made by the great master to represent the Aurole in perspective as it spreads its elliptical and many-rayed field

* Mrs. Jameson evidently was under the impression that each Person of the Trinity was invested with a distinctive Nimbus, probably holding that the so-called "cruciform" Nimbus denoted God the Son. We have shown that such a Nimbus belonged alike to each Person, and was not distinctive of any one.

† Mrs. Jameson uses a wrong expression here; she should have said *almond-shaped Aureole*. The word "glory" is not applicable, as we have already shown.

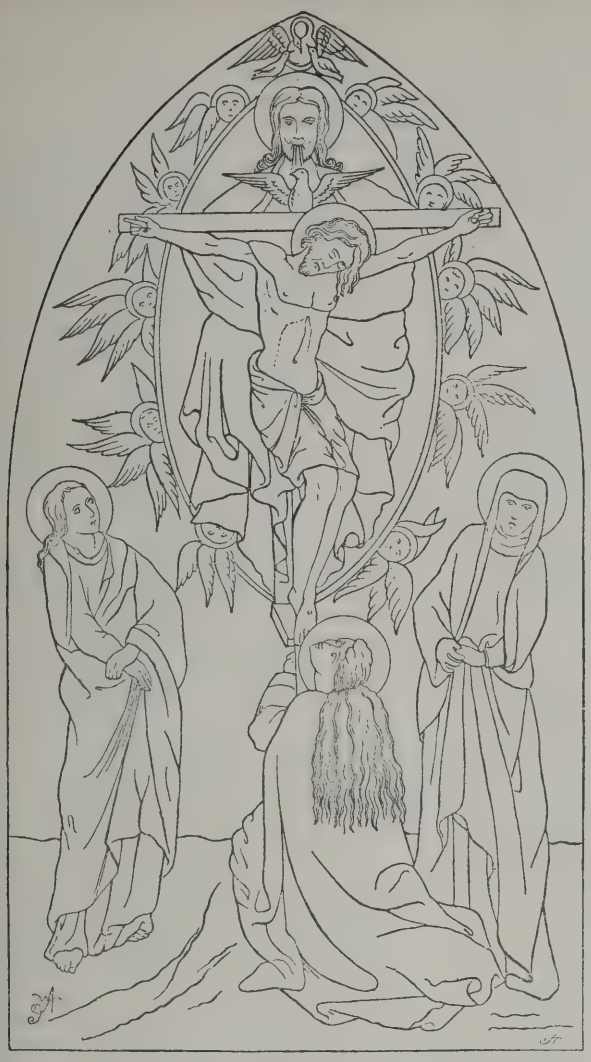

Fig. 42.

Fig. 43.

on the off side of the figure, almost entirely inclosing its outlines. The Aureole of the Ascension is frequently borne upwards by angels, as in Fig. 31 (Article XI.); this treatment, however, imparts a very material character to the attribute, quite at variance with its true or generally accepted nature. It is usually met with in Italian art. In a painting by Perugino (1495), preserved in the museum at Lyons, angels surround but do not support the Aureole; and around its broad border are thirteen heads with six wings each, probably intended for Seraphim. The figure of Christ is erect, facing the spectator, and the Aureole occupies its normal position, enveloping it in a field of splendour. The tradition of early art has, so far as the Nimbus is concerned, disappeared; it is in this instance represented as a ring hovering over the head of Christ.

Speaking of the Aureole of the Ascension supported or carried by angels, Mrs. Jameson correctly remarks:—"It would seem as if the words, 'He was taken up,' were, as time progressed, interpreted to mean the interposition of angels and help of heavenly machinery. Christ no longer takes personal part in the act of movement; but, by the 12th and 13th centuries, appears seated passively in the mandorla" (almond-shaped Aureole), "which is carried along by the sole agency of angels. Here, therefore, the main and actual idea of the Ascension is sacrificed. The glory in which the Lord sits is held by angels like a *tableau* presented to the view of those below, whom He is blessing from that height; but there is no sign that He is receding from them. It is a more sumptuous composition than that of a single figure rising through the air, but is not so impressive, and was probably derived from the stage machinery of sacred plays."
